## SIGNIFICANT GOLD, SILVER AND BASE METAL GEOCHEMICAL ANOMALIES IDENTIFIED AT LEWIS PONDS

- Extended soil survey defines gold and silver geochemical anomalies over 1,300m strike length
- Significant assay values of up to 6.2 g/t gold and 26.1 g/t silver-in-soil samples
- Results highlight a number of high-potential areas for drilling; previously untested for precious metals
- A review of historical data will be undertaken to assess the economic potential of high-grade gold and silver shoots within the Mineral Resource
- The Lewis Ponds Mineral Resource is currently estimated to be 20.24Mt @ 1.5% Zn, 0.7% Pb, 0.1% Cu, 0.5g/t Au, 33.3g/t Ag and is Classified as Inferred and Indicated in accordance with JORC (2012)<sup>1</sup>

### Lewis Ponds Project – EL5583 (GRL 100% ownership) - Summary

Historical mining and exploration at the Lewis Ponds Project ("Lewis Ponds' or 'the Project') focussed predominantly on base metals with associated gold and silver as byproducts. At today's metal prices an analysis of higher-grade resources previously defined at Lewis Ponds, indicates that precious metals are potentially the higher proportion of contained revenue (depending on flotation recoveries). Adding to the gold credentials of Lewis Ponds, the project area lies adjacent to the Lewis Ponds Fault, a splay of the Godolphin Fault, which hosts the 2 million oz gold deposit at McPhillamy's approximately 20 km to the south of the Lewis Ponds Mine. As gold was routinely not assayed for in historic soil surveys at Lewis Ponds, Godolphin Resources Limited ('Godolphin', 'GRL' or the Company) recently initiated an exploration program to define gold drill targets at the project. Following an initial orientation survey which located highly anomalous gold-in-soils (ASX announcement 3 August 2020), GRL recently completed an extended soil survey to test a much larger area. A total of 320 soil samples were taken over an area which incorporated the historic Lewis Ponds Mine in the north, extending to south of the Tom's Mine (a total strike length of 2.4 km). Assay results define significant precious and base metal anomalies over a strike length of 1,300 metres. Precious metal values of up to 6.2 g/t gold and 26.1 g/t silver have been found in soils. The gold and silver results are particularly significant as they provide high priority 'targets" for follow up, in areas with limited historical drilling.

<sup>1</sup> See Godolphin Resources Prospectus dated 16 December 2019. The Company is not aware of any new information or data that materially affects the information included in the referenced Prospectus and confirms that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed.

### Background

Lewis Ponds consists of EL5583 which covers approximately 148 km<sup>2</sup> located 15 km east of Orange (Figures 1 & 2). This project is high priority for Godolphin due to the extensive historic gold and base metal workings, a current Mineral

Resource Estimate (see page 28 of the <u>Godolphin Prospectus, lodged with the ASX</u> on 16 December 2019), and freehold title held by TriAusMin (a wholly owned subsidiary of Godolphin).

The Lewis Ponds area was an active mining centre from the early 1800's until the 1920's. The workings were centred around two major areas being the Lewis Ponds and Tom's Mine. All ore was processed at the historic Lewis Ponds Mine's treatment facility and smelter.

GRL's Lewis Ponds project is historically interpreted as a Volcanic-Hosted Massive Sulphide (VHMS) deposit with lead/zinc and associated precious metals, and a potential later stage shear hosted gold overprint. Historical mining, drilling and exploration at Lewis Ponds focussed predominantly on base

Figure 1: Lewis Ponds location map

metal exploration and not gold. Due to the proximity of Lewis Ponds to the McPhillamy's gold project (which lies on the same geological structure) and observed alteration styles, Godolphin is currently concentrating its efforts on gold exploration at Lewis Ponds.

Following an initial orientation survey which located anomalous gold-in-soils (ASX announcement 3 August 2020), GRL recently completed an extended soil survey to test a much larger area. A total of 320 soil samples were taken in an area which incorporated the historic Lewis Ponds mine in the north extending to the south of the Tom's Mine, a total strike length of 1,300 metres. The sample spacing was 100m by 50m at a depth of 75cm or just above bedrock in shallow sub crop areas and historical workings were avoided (see Figure 3).

#### **Soil Sample Results**

A zone of elevated gold and silver concentrations in soil has been defined (Figures 3 & 4). This zone of elevated goldin-soil samples extends from the Lewis Ponds Mine in the north, to south of the Tom's Mine a strike distance of 1,300 metres. The zone of high gold concentrations in soils has discrete highs within it and has identified a number of areas with minimal historical drilling, such as around the limestone quarry to the west of Lewis Ponds Mine, and an area west and north-west of the Summers Mine workings.

The zone of elevated gold-in-soil samples is open to the north and sampling will be extended following land access approval which has recently been received. The maximum gold-in-soil result is 6.2 g/t with the average for anomalous (>20ppb) samples being 138 ppb (150 samples). The overall average gold-in-soil result is 74.5 ppb which is highly anomalous.

The silver anomaly essentially overlaps the gold anomaly but is more ubiquitous and slightly larger. Silver returned a maximum result of 26.1 ppm and an average of 1.2 ppm.

The soil survey has also defined significant zinc, lead and copper anomalies (Appended). Lead and zinc anomalies are coincident with precious metals whereas the copper anomaly starts further south and extends to the southern margin of the grid. The grid will be extended to follow the copper anomaly southwards.

### **Future Work**

Lewis Ponds is a high-potential project for Godolphin. The significant results attained in this soil survey have prompted a re-examination of historical drill data and resources. This will include remodelling the currently estimated Mineral Resource at Lewis Ponds to focus on higher grade shoots with high precious metal values. This work will provide a better understanding of the distribution of the higher-grade portions of the lenses, define follow-up drill targets, and facilitate preliminary financial modelling.

Following on from the review, the Company intends to undertake an exploration drilling programme targeting precious metals. This will help the Company better understand the precious metals potential of the area and ultimately aims to increase the higher-grade gold-silver Mineral Resources at the Lewis Ponds Project.

Godolphin looks forward to keeping shareholders updated with further news.

#### ENDS

This market announcement has been authorised for release to the market by the Board of Godolphin Resources Limited.

### About Godolphin Resources

Godolphin Resources ("Godolphin" – ASX: GRL) is an ASX listed resources company, with 100% controlled Australianbased projects in the Lachlan Fold Belt (LFB) NSW, a world-class gold-copper province. Currently the Company's tenements cover 3200km2 of highly prospective ground focussed on the Lachlan Transverse Zone, one of the key structures which controlled the formation of copper and gold deposits within the LFB, the Godolphin Fault and the Molong Volcanic Belt. The Gundagai projects are associated with a splay of the Gilmore Suture mineralised structure. The Orange-based Godolphin team is rapidly exploring its tenement package with focussed, cost effective exploration leading to systematic drilling programmes.

#### **Competent Person Statement**

The information in this report that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based on information compiled by Johan Lambrechts, a Competent Person who is a Member of the Australian Institute of Geoscientists. Mr Lambrechts is a full-time employee of Godolphin Resources Limited, and shareholder, who has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Lambrechts consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

### Appendix 1 – JORC Code, 2012 Edition, Table 1 report

Section 1 Sampling Techniques and Data (Criteria in this section applies to all succeeding sections)

Criteria	JORC Code explanation	Commentary				
Sampling techniques	<ul> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> </ul>	<ul> <li><u>Rock chip samples</u> <ul> <li>These samples are collected from outcrop, float, or other exposure. Samples are clear of organic matter.</li> </ul> </li> <li><u>Soil samples</u> <ul> <li>These samples are collected from the "C" soil horizon at depths up to 75cm deep or just above bedrock in shallow sub crop areas. The samples are screened to minus 355 micron and are free of organic matter.</li> <li>In order to optimize the samples ability to represent the mineralization, the samples are collected from the "C" horizon in order to mitigate the misrepresentation caused by transported material.</li> <li>These sampling methods are standard industry methods and are believed to provide acceptably representative samples for the type of mineralisation encountered.</li> </ul> </li> <li><u>Sampling methods used</u></li> <li>Soil Samples</li> </ul>				
Drilling techniques	Drill type (or core, reverse circulation					
Drill sample recovery	<ul> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details.</li> <li>Method of recording and assessing core and abia comple recording and reculto</li> </ul>	<ul><li>Not applicable.</li><li>Not applicable.</li></ul>				
Logging	<ul> <li>and chip sample recoveries and results assessed.</li> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> </ul>	<ul> <li>Samples logged with recording of colour and potential lithology based on nearby outcropping rock (noted in "comments"). Samples are sieved (-1mm) in the field before being placed into Calico bags. The samples are later sieved to -355 micron and reference material kept in chip trays for each sample.</li> </ul>				
Sub-sampling techniques and sample preparation	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	<ul> <li>All rock chip samples (Blanks) are crushed then pulverised in a ring pulveriser (LM5) to a nominal 90% passing 75 micron. An approximately 100g pulp sub-sample is taken from the large sample and residual material stored.</li> <li>A quartz flush (approximately 0.5 kilogram of white, medium-grained sand) is put through the LM5 pulveriser prior to each new batch of samples. A number of quartz flushes are also put through the pulveriser after each massive sulphide sample to ensure the bowl is clean prior to the next sample being processed. A selection of this pulverised quartz flush material is then analysed and reported by the lab to gauge the potential level of contamination that may be carried through from one sample to the next.</li> </ul>				
Quality of assay data and laboratory tests	<ul> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul> <li>Sample preparation and assaying is being conducted through ALS Laboratories, Orange, NSW with certain final analysis of pulps being undertaken at the ALS Laboratory in Perth WA and Brisbane QLD and/or Bureau Veritas Laboratories in Adelaide.</li> <li>Gold is determined by 30g fire assay fusion with ICP-AES analysis to 1ppb LLD.</li> <li>Other elements by mixed acid digestion followed by ICP-AES analysis.</li> <li>Laboratory quality control standards (blanks, standards and duplicates) are inserted at a rate of 5 per 35 samples for ICP work.</li> <li>Godolphin also insert blanks and standards at a frequency of 1 per 10-15 samples.</li> </ul>				
Verification of sampling and assaying	The verification of significant     intersections by either independent or	<ul> <li>An internal review of results was undertaken by Company personnel. No independent verification was undertaken at</li> </ul>

In the 2006 renewa the license was party relinquished to 57 units and the following year TriAusMin purchase 289 hectares of freehold land over Lewis Ponds. Upon renewal in 2011, EL 5583 wa reduced to 51 units for a further term until 24<sup>th</sup> June 2014. The second renewal of EL 558 was granted until June of 2017 with no reduction in tenement size.</li> </ul>

		<b>_</b>
Criteria	JORC Code explanation	Commentary
		On August 5 <sup>th</sup> 2014, TriAusMin underwent a corporate merger with Heron Resources Limited which resulted in Heron acquiring 100% of EL 5583 and the 289 hectares of freehold land over Lewis Ponds. In 2017, Ardea Resources Ltd was "spun out" as a new company, and gained ownership of EL 5583, with TriAusmin becoming a wholly owned subsidiary of Ardea. In 2019, Godolphin Resources Ltd was "spun out" as a new company, and gained ownership of EL 5583, with TriAusmin becoming a wholly of Godolphin.
$\mathcal{D}$		In the 1850's gold was discovered at Ophir At this time Lewis ponds was already a small mining camp. Shallow underground mining took place at Spicers, Lady Belmore, Tom's Zone and on several mines in the Icely area during the period 1887 to 1921. In 1964, a number of major companies including Aquitaine, Amax, Shell and Homestake explored the region looking for depth and strike extensions of the Lewis Ponds mineralisation but failed to intersect significant mineralisation. These companies had drilled approximately 8,500 metres. Not commonly noted, but of great significance is the fact that much of Lewis Ponds' early development was in lieu of the high grades of silver in its ores. It appears that silver was the major commodity mined at different points of the mines' history.
Geology	<ul> <li>Deposit type, geological setting and style of mineralization.</li> </ul>	The Lewis Ponds Project occurs on the western margin of the Hill End Trough in the eastern Lachlan Fold Belt, which hosts a range of base metals in volcanic-hosted massive sulphide deposits (VMS), porphyry copper-gold and gold deposits, including Woodlawn (polymetallic), Cadia-Ridgeway (Cu-Au), North Parkes (Cu-Au), Copper Hill (Cu-Au), Tomingley (Au) and McPhillamys (Au).
		The Molong Volcanic Belt is west of the EL 5583 and comprises Ordovician to early Silurian basal units of mafic to ultramafic volcanic and sedimentary rocks of the Kenilworth and Cabonne Groups. These units are separated from the Hill End Trough by the extensive Godolphin Fault Thrust System.
$\mathcal{D}$		The Mumbil Group unconformably overlies the Molong Volcanic Belt and comprises shallow-water Later Silurian sequence of felsic volcanics, volcaniclastics, siltstone and limestone. Part of this Group is the Barnby Hills Formation at Lewis Ponds and comprises (tuffaceous) siltstones overlying limestone and rhyodacitic volcaniclastics. To the east and conformably overlying rocks of the Mumbil Group, siltstone and minor sandstone units form part of the Silurian-Early Devonian Hill End Trough sedimentary sequence The Lewis Ponds deposit is located in a locally highly structured zone within the western limb of a north-west plunging syncline. The deposit consists of stratabound, disseminated to massive sulphide lenses.
		The deposit is hosted in Silurian felsic to intermediate volcanic rocks as a thin, mostly fine- grained sedimentary unit with occasional limestone lenses that has undergone significant deformation and is now defined as a steeply east dipping body with mineralisation that occurs over a strike length of more than 2km.
		The Southern mineralisation occurs within a limestone breccia and Tom's mine is hosted by siltstone and consists of fine-grained tuffaceous sediments. The mineralised zones unconformably overlie a sequence of strongly foliated and hydrothermally altered quartz-plagioclase dacite. Mineralisation occurs in two main styles: plunging shoots of thicker, high-grade mineralisation within the anticline and syncline axes; and as tabular lenses in fold limbs and shear zones.
Drill hole Information	<ul> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</li> </ul>	<ul> <li>Total drilling to the date of this report was 63,334.64 metres comprising of:</li> <li>117 primary diamond holes for 41,253.43 metres</li> <li>30 wedged diamond holes for 15,077.51 metres</li> <li>9 diamond tails to RCP holes for 2,094.50 metres</li> <li>57 RCP holes for 4,909.20 metres</li> </ul>
Data aggregation methods	<ul> <li>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high</li> </ul>	<ul> <li>No grade aggregation, weighting, or cut-off methods were used for this announcement.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<ul> <li>grades) and cut-off grades are usually Material and should be stated.</li> <li>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> </ul>	
Relationship between mineralization widths and intercept lengths	<ul> <li>These relationships are particularly important in the reporting of Exploration Results.</li> <li>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</li> </ul>	The mineralised units are near vertical and drilling has almost exclusively been conducted from the east at perpendicular angles with the mineralised units. The drill angles vary, but is generally at 60 degrees down, resulting in mineralised intersections slightly longer than the true width. Interpretation of the mineralised units honour the true width.
Diagrams	<ul> <li>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</li> </ul>	Maps incorporated into the announcement.
Balanced reporting	<ul> <li>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Results.</li> </ul>	<ul> <li>All results of Godolphin's soil sampling program have been reported in this releaseSee appendix below</li> </ul>
Other substantive exploration data	<ul> <li>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</li> </ul>	A Magnetic TMI survey was conducted in 2004 and found magnetic anomalies south east of Lewis Ponds.
Further work	The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).	Currently under assessment. Follow-up work is required, as mentioned in body of the announcement.
