ASX Announcement

14 October 2020

SUCCESSFUL COMPLETION OF ISOLATION SOUTH DRILLING PROGRAM

HIGHLIGHTS

- Isolation South drilling program successfully completed with no material safety or environmental incidents recorded; drilling rigs have now demobilised.
- 125 rotary air blast (RAB) holes completed in the 2020 exploration program for 21,500 metres of drilling at Isolation South, 33 large diameter core (LDC) holes and 5 HQ geotechnical and hydrogeological holes completed; strong LDC core recoveries achieved.
- Successfully delineated the area defined by the optimised pit shell (identified in the Elan Project Scoping Study) and supplied the necessary data to underpin a robust Pre-Feasibility Study (PFS).
- Average total apparent coal thickness of over 30 metres in RAB holes covering the optimised pit shell area; consistent with expectations from the Isolation South geological and resource models.
- Shallow, thick coal deposition with starting depth as low as 3 metres below surface and total apparent coal thickness of over 80 metres in several holes (including one over 100 metres).
- 2D seismic program of 5 line kilometres completed; coupled with new LiDAR topographical survey will assist in model accuracy underpinning the PFS mine planning process.
- Interim Elan Project resource update on track for current quarter; substantial upgrades in resource classification at Isolation South expected plus potential for further resource growth.

Atrum Coal Limited (ASX: ATU) (**Atrum** or the **Company**) is pleased to advise of completion and final results from the 2020 drilling program at its 100%-owned Elan Hard Coking Coal Project (**Elan Project**) in southern Alberta, Canada.

The 2020 drilling program at Isolation South comprised 125 RAB holes, 33 LDC holes and 5 HQ geotechnical and hydrogeological holes. The RAB holes were completed across a typical spacing of 100 to 200 metres. The LDC drilling was designed to reduce the spacing between coal quality data points to around 250 metres; it achieved this along with excellent core recoveries. The program had both an infill and extensional focus, aimed at significantly upgrading resource classification and potentially also expanding the Isolation South resource base.

Atrum Managing Director and CEO, Andrew Caruso, commented: "I'd like to congratulate the entire Atrum site team and our key partners for the conduct of a safe, efficient and highly effective 2020 drilling program at Isolation South. The primary focus was infill drilling, both RAB and LDC, of the current Inferred resource areas that were excluded from the Elan Project Scoping Study mine schedule. Upgrade of these Inferred resources into Indicated and/or Measured categories delivers the strong potential for inclusion in the PFS mine schedule and subsequent conversion to reserves. Successful inclusion presents substantial upside potential to the life-of-mine production volumes and base case economics presented in the Elan Project Scoping Study. We look forward to completing the interim Elan Project resource update later this quarter."

RAB drilling results

The RAB drilling program was successfully completed in September 2020, with the planned allocation of 125 RAB holes drilled for 21,500 total metres of drilling. The overall aim of the RAB drilling program was to delineate structure and demonstrate continuity of the four seam groups over the optimised pit shell extent identified in the Scoping Study.

The 125 RAB holes were completed at a rapid rate due to the fast rates of penetration achieved with hammer drill bits and compressed air as the drilling medium. All holes were completed with downhole geophysical logging with gamma, density, caliper, deviation, dipmeter and sonic wireline logging undertaken.

Of this total, 117 holes were drilled within the Scoping Study pit shell, reducing the typical hole spacing to 100 - 200 metres in most areas. The RAB program has resulted in a far higher degree of confidence in coal seam continuity, coal seam splitting and coalescing, subcrop zones and delineation of structural features including low angle thrust faults.

The results of the RAB program tracked in-line with expectations with the average total apparent coal thickness maintaining approximately 30 metres per hole in the Scoping Study optimised pit shell area. This is consistent with expectations from the Isolation South geological and resource models for these domains. The coal intersections are also shallow, with starting depth as low as 3m below surface in areas where the coal is not capped by the Cadomin Formation.

The RAB program has confirmed that the coal seams of the Mist Mountain Formation are continuous over the optimised pit shell area identified during the Scoping Study. Total apparent coal thicknesses per hole and starting depths for the 117 holes drilled within the Scoping Study pit shell area are tabulated in Appendix A (holes up to 106 previously released). The same data for the 8 northern scout holes is also summarised in Appendix A (all previously released). The locations of completed RAB (plus LDC and hydrogeology) holes are shown in Figures 1 and 2.

LDC drilling results

The LDC coring program was successfully completed earlier this week with the completion of hole ISLD20-35, the last hole of the planned program of 33 cored holes. The 33 LDC holes drilled complement the three LDC holes that were completed in February 2020. The planned distribution of LDC holes has now been achieved, with the spacing between coal quality data points typically 250 metres or less within the Scoping Study optimised pit shell area.

Success with the large diameter (150mm) method of coal coring was achieved consistently, with excellent core recovery reported for most holes (core recoveries are provided up to ISLD20-34 in Appendix A). Some LDC holes (including ISLD20-01, 02, 04, 24 and 28) required partial or full re-drills to ensure that the coal cores from the required coal seams were sufficiently recovered in each location.

The LDC program, and associated coal quality testwork, aims to demonstrate continuity of coal quality characteristics over the Isolation South area. The data acquired from the coal quality testwork will feed into the Coal Handling and Preparation Plant (**CHPP**) design, and determination of practical processing yield, product specification and optimisation within the current PFS.

Coal cores from the LDC program were submitted to GWIL Birtley in Calgary for detailed coal quality, washability and clean coal laboratory testwork. Clean coal composites are prepared by Birtley and forwarded to COALTECH Petrographic Associates, USA (for clean coal characterisation tests). Blended products are designed by Atrum and prepared by Birtley for delivery to coal carbonisation laboratories in Europe; DMT Coal Coke Group (Germany) and INCAR (Spain).

Coal and coke quality results from the first four LDC holes of the recently completed program were released last week (see Atrum ASX released dated 7 October 2020, *Isolation South Tier 1 HCC*). These results again confirmed that Isolation South clean coal and coke quality is closely correlated to the globally traded Tier 1 HCC products produced at the nearby Elk Valley mines.

Further coal characterisation and large-scale carbonisation (+500kg moveable wall oven) tests are to be conducted from the total 33 LDC hole samples. Coal quality analyses on more than 400 further core samples are already in process.

Seismic and LiDAR Surveys

A 2D seismic acquisition program was completed on site in September 2020 by Explor Geophysical Ltd (**Explor**). The 2D seismic program consisted of five individual lines across the Scoping Study optimised pit shell for a total of 5 line kilometres. After a trial line was conducted in August 2020, Explor returned to the site to undertake the program using a low impact seismic source and receiver points that are appropriate for shallow depth coal deposits.

The 2D seismic program is set to assist in the interpretation of structural features, including thrust faults that result in stacking and the structurally thickened coal zones observed in some zones. The seismic reflection data is currently being processed and interpreted.

An airborne LiDAR survey was flown over the Isolation South site in July 2020 and a resultant digital elevation model (DEM) has now been processed and delivered. The high accuracy LiDAR surface will be incorporated into geological models and mine planning work.

Hydrogeology and geotechnical program

Five multi-purpose hydrogeological / geotechnical holes were completed in the 2020 program. These boreholes are fully cored (HQ size) from the surface and are used for the assessment and monitoring of groundwater aquifers. Vibrating wire piezometers (VWPs) are being installed for the measurement of pore water pressures.

The HQ core samples are also used for geotechnical logging, sampling and testing, with the overall geotechnical program oversight provided by Golder Associates. The geotechnical testwork is an important part of the program in order to provide geotechnical data to underpin PFS geotechnical design parameters.

HQ coal core samples with sufficient core recovery (minimum 80% linear recovery per seam / ply) are also being sampled and submitted for coal quality and washability testing.

Interim Elan Project resource update

An interim update of the Elan Project resource is currently being prepared and is expected to be completed during the current quarter. This update is set to incorporate all RAB results from the 2020 drilling program plus coal quality testwork results received to date from LDC samples. Substantial upgrades in resource classification at Isolation South are expected, with the potential also for further resource growth.

At Isolation South, 108Mt of Inferred resource within the optimised pit shell was excluded from the mine schedule and production target in the Elan Project Scoping Study (which totaled 126Mt), in accordance with the current ASX/ASIC regulatory framework (see Atrum ASX release dated 16 April 2020, *Elan Project Scoping Study*)¹. Targeted upgrade of these Inferred Resource portions of Isolation South into Indicated and/or Measured Resource categories delivers the strong potential for inclusion in the mine schedule for the Elan Project PFS and subsequent conversion to Reserves. Successful inclusion presents substantial upside potential to the life-of-mine production target and forecast base case economics presented in the Elan Project Scoping Study results.

About Atrum Coal

Atrum Coal (ASX: ATU) is a metallurgical coal developer. The Company's flagship asset is the 100%owned Elan Hard Coking Coal Project in southern Alberta, Canada. Elan hosts large-scale, shallow, thick, hard coking coal (HCC) deposits with a current resource estimate of 454Mt (142Mt Indicated and 312Mt Inferred). Comprehensive coal quality testing from the 2018 and 2019 exploration programs, combined with review of substantial historical testwork data for the broader Elan Project, has confirmed Tier 1 HCC quality.

Elan's southern boundary is located approximately 13 km from an existing rail line with significant excess capacity, providing direct rail access to export terminals in Vancouver and Prince Rupert. It shares its southern boundary with Riversdale Resources' Grassy Mountain Project, which is in the final permitting stage for a 4.5 Mtpa (saleable) open-cut HCC operation. Around 30km to the west, Teck Resources operates four mines (the Elk Valley complex) producing approximately 25Mtpa of premium HCC for the seaborne market.

Atrum completed a Scoping Study in April 2020 which demonstrated the strong technical and economic viability of development of the Elan Project.

¹ For full Scoping Study and resource details refer to Atrum ASX release dated 16 April 2020, *Elan Project Scoping Study*. Atrum confirms that all material assumptions underpinning the production target and forecast financial information within the Scoping Study, and the resource estimate outlined above, continue to apply and have not materially changed.

APPENDIX A: DRILLING RESULTS

RAB hole details and total apparent coal thickness (Scoping Study optimised pit shell area)

APPENDIX B: JORC TABLES

Competent Persons Statement

Exploration Results

The information in this document that relates to Exploration Results for the Isolation South project area is based on, and fairly represents, information and supporting documentation prepared by Mr Brad Willis, who is a Member of the Australasian Institute of Mining and Metallurgy (#205328) and is a full-time employee of Palaris Australia Pty Ltd.

Mr Willis has read and understands the requirements of the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Exploration Targets, Mineral Resources and Ore Reserves (JORC Code, 2012 Edition). Mr. Willis is a Competent Person as defined by the JORC Code, 2012 Edition, having twenty years' experience that is relevant to the style of mineralisation and type of deposit described in this document.

Neither Mr. Willis nor Palaris Australia Pty Ltd has any material interest or entitlement, direct or indirect, in the securities of Atrum or any companies associated with Atrum. Fees for the preparation of this report are on a time and materials basis. Mr. Willis has visited the Elan project site with Atrum coal personnel during the exploration programs in 2018 and 2019.

The JORC Code (2012)

Table 1 - Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	 Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. 	 In total, 35 cored drillholes have been completed in 2020 at Isolation South for the collection of large diameter (LD) samples which are logged and sampled for coal quality and washability testwork Sampling has been undertaken on LD (150mm or 6" diameter) cored holes, as well as HQ core samples from five hydrogeology / geotechnical holes Samples are taken on ply intervals and are manually composited in the laboratory after results for raw light transmittance (LT) ash, ARD and IM are received from grab samples Atrum Coal provides the instructions to the laboratory for manually compositing individual ply samples In order to ensure representivity, coal seams sampled with <80% linear core recovery are not tested at the laboratory From the 125 RAB holes completed to date in the 2020 program, drill cuttings have been collected at 1m depth intervals. These samples are not intended to be used for coal quality testwork
Drilling techniques	 Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc). 	 Three LD holes were completed in February 2020 and an additional 33 holes drilled between June and October 2020 The LD cored holes are drilled with PDC or tungsten bits and use double tube core barrels (triple tube core barrels with LD core are uncommon in Canada) The LD holes were geophysically logged to total depth in the open hole, with seam and sample intervals adjusted to the geophysical log depths (where necessary) The 125 RAB completed in 2020 are percussion (rotary air blast) boreholes with a 4 1/2" (115mm) diameter hammer drill bit All of the boreholes completed in 2020 were geophysically logged to total depth in the open hole, or through HQ drill pipe in the event of severe hold instability
Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	 The LD cored boreholes were geophysically logged and cored seam intervals have compared to the geophysical log data Achieving consistently high core recoveries can be difficult due to the fractured and friable nature of the coal seams The large diameter (150mm or 6" core size) coring programs at Elan have generally achieved better core recoveries than PQ or HQ cores, and appears to be a more suitable coring technique for this type of coal

Criteria	JORC Code explanation	Commentary
		 Core recoveries were recorded and cumulative tallies kept. Any samples from seams with less than 80% linear recovery (relative to geophysical log depths) are not tested by the laboratory Cored boreholes were geophysically logged to calculate linear recovery, and ensure recovered core lengths are representative of the full seam
Logging	 Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	 Core samples were logged in detail including lithology, brightness, sedimentary features and defects Boreholes were geophysically logged with downhole tools including long and short spaced density, caliper and gamma, sonic, deviation and dipmeter The seam intervals in RAB holes have been determined from the geophysical log signatures
Sub- sampling techniques and sample preparation	 If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all subsampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	 All core sampled is sent to the testing lab (no slabbing or splitting of core is undertaken) The LD cores are subject to drop shatter testing, sizing analysis and subjected to float sink testing by size fraction (50mm x 4mm, 4mm x 1mm, 1.0mm x 0.25mm) and - 0.25mm), with raw coal analysis being undertaken after completion of the initial drop shatter and dry sizing. Clean coal composites are typically prepared at selected cut-points for each size fraction as directed by Atrum Coal, for detailed coal quality and carbonisation testing. Carbonisation samples are generally seam blend composites, with varying proportions of each seam group, as directed by Atrum Coal The LD core provides a much better representation of size fractions relative to smaller diameter core samples and is preferred for coal preparation design
Quality of assay data and laboratory tests	 The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	 Analytical testwork (raw, washability and initial clean coal testing) undertaken by nationally accredited laboratory GWIL Birtley of Calgary, generally to ASTM standards. The lab participates in International Canadian Coal Laboratories Round Robin series (CANSPEX) and test results are consistently ranked in preferred groupings. The Competent Person undertook a site visit and tour of the GWIL Birtley laboratory in 2018 Drop shatter, sizing analysis and float sink testing is undertaken on LD samples according to testing protocols designed by Atrum Coal Clean coal composites are prepared by Birtley and forwarded to COALTECH Petrographic Associates, USA (for clean coal characterisation tests) Blended products are designed by Atrum and prepared by Birtley for delivery to two world-class coal carbonisation laboratories in Europe; DMT Coal Coke Group (Germany) and INCAR (Spain)
Verification of sampling and assaying	 The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	 Geological data is collected in line with Atrum Coal's exploration procedures and guidelines Sample interval depths are as measured by the field geologist (drillers depths), and adjusted to align with geophysical log depths, while measured sample interval thicknesses are retained GWIL Birtley undertakes preliminary checks of assay data using regression analysis, and the data is checked by Atrum Coal and Palaris geologists All data has been encoded, collated and cross checked by Atrum Coal, and later by Palaris Twinning of existing rotary air blast (RAB) holes is used for targeted coring of coal seams in the LD cored holes. The twinned cored holes are also geophysically logged Reported results in this announcement have not been adjusted in any way, shape or form

Criteria	JORC Code explanation	Commentary
Location of data points	 Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	 The collar locations of the LD boreholes have been surveyed using Trimble surveying technology The co-ordinate system is UTM projected grid NAD83 Zone 11N The topographical surface is sourced from a LiDAR survey and has a reasonable correlation with borehole collars (a new LiDAR survey is being flown) RAB and LDC hole collars and associated borehole details are provided in Appendix A of this announcement
Data spacing and distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	 RAB hole density has been increased to a typical spacing of 100 – 200 metres between holes in most areas The 35 LD holes drilled are located within the Scoping Study pit shell area of Isolation South and are typically spaced at approximately 250m apart Resource classification and estimation will be revisited at the end of this year's drilling program (Q4 2020) Sample compositing (into seam intervals) is generally manually undertaken in the laboratory after instructions are provided by Atrum Coal. Additional compositing is undertaken in Minex software and requires 80% linear recovery as specified in the Minex BHDB settings, while composite values are mass weighted using both thickness and true RD as weighting variables
Orientation of data in relation to geological structure	 Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	 The 35 LD holes completed in 2020 have been drilled vertically, twinning existing vertical RAB holes with targeted coring intervals The RAB holes completed in 2020 are mostly vertical, with some inclined holes as shown in the borehole collar table in Appendix 1 Electronic deviation data from each hole is imported into the Minex borehole database. The geological modelling software captures the downhole inclination and deviation, and structural modelling assists in correcting the apparent seam thicknesses to true thicknesses in model grids 3D representation is relatively good with the 2020 infill program, and will improve with ongoing infill drilling and the 2D seismic program to be undertaken
Sample security	The measures taken to ensure sample security.	 The LD core is photographed, sampled, labelled and bagged before being submitted to the testing laboratories Samples have a unique sample number that is provided on tags in the bag, outside the bag and in separate digital and hard copy sample advice. Each item of advice lists project name, borehole, top and base of sample and sample number The laboratory records provided include sample identification numbers and weighed sample mass All measures are taken to ensure sample security represents best practice by industry standards
Audits or reviews	 The results of any audits or reviews of sampling techniques and data. 	 Palaris representatives visited the site in 2018 and 2019 to oversee the drilling program, and ensure a high standard of geological data is provided by Atrum Coal's geologists Processing consultants Sedgman have reviewed and provided input into the sizing and washability components of the testing program

Table 1 – Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	 The Isolation South coal agreements were granted to Elan Coal Ltd in 2012/13, Elan Coal was acquired by Atrum Coal in March 2018. Coal Lease agreements provide the right to exclusively explore the land within the boundaries of the lease and are granted for a term of 15 years (with an option to extend at expiry) The Property falls within the Rocky Mountain Forest Reserve, which is managed by the Alberta Government An Exploration Permit for Isolation South was granted to Atrum Coal by the Alberta Energy Regulator (AER) covering exploration activities undertaken in February 2020 (as

Criteria	JORC Code explanation	Commentary
		reported to the ASX on 29 July 2019)
Exploration by other parties	 Acknowledgment and appraisal of exploration by other parties. 	 Scurry-Rainbow Oil Limited (Scurry) undertook exploration of the Isolation South area in the 1970s, then referred to as the Oldman River prospect. Exploration activities included bulldozer assisted trenching, establishment of access roads, numerous adits and 19 HQ size fully cored holes for a total of 3,286m of coring. The cored holes were accompanied by geophysical logging and seam intervals interpreted from geophysical log depths
Geology	 Deposit type, geological setting and style of mineralisation. 	 Atrum Coal's Elan project is located in the province of Alberta, in the Crowsnest Pass area of the Crowsnest Coalfield, on the Front Ranges of the Canadian Rocky Mountains Coal-bearing sedimentary sequences occur within the Mist Mountain Formation of the Late Jurassic to Early Cretaceous aged Kootenay Group, which was strongly deformed during the Late Cretaceous Laramide Orogeny. This resulted in the development of north to northwest-trending folds and steeply dipping reverse faults. The project is located within the Rocky Mountain Thrust Belt, west of the Livingstone Thrust fault and the project extent encompasses the McConnell thrust sheet Major folds regionally trend in a northerly direction. Secondary local thrusts typically occur within the area, generally determining the distribution and outcrop of coal seams along the thrust fault zones. In many areas of the Crowsnest Coalfield, structure is principally the controlling factor in resource development.
Drill hole Information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. 	 This information is provided for all RAB and LDC holes completed in 2020 at Isolation South, in Appendix 1 of this ASX announcement
Data aggregation methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	 No cut-off grades were applied to the exploration results in this announcement No coal quality results are presented in this announcement
Relationship between mineralisation widths and intercept lengths	 These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	 The results tabulated in this announcement are apparent thicknesses as recorded in vertical drill holes and may be different to the true thickness of the seams Seam dips are generally moderate (25 degrees) to the west at Isolation South More work will need to be undertaken to determine true seam thickness; this will be addressed through use of borehole deviation survey data, seismic survey, and updated structural interpretation / fault modelling
Diagrams	 Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	 Previous ASX announcements have provided progressive updates on Exploration Results and Coal Resources at Isolation South Borehole locations plans are provided along with drill hole locations from the 2020 program Work has commenced on updating geological models incorporating the recent drilling results
Balanced reporting	 Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or 	 To ensure balance reporting of Exploration Results, the total coal thicknesses stated are summarised along with the hole location for all holes drilled in 2020

Criteria	JORC Code explanation	Commentary
	widths should be practiced to avoid misleading reporting of Exploration Results.	 To ensure balance reporting of Exploration Results, Appendix 1 includes the results for all RAB holes drilled at Isolation South in 2020
Other substantive exploration data	 Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	 A 2D seismic of five lines and totalling 5 line km was completed in September 2020, with the data currently being processed Previous ASX announcements have provided progressive updates on Exploration Results and Coal Resources at Isolation South Atrum Coal geologists have undertaken a significant surface mapping program in 2019, collecting data points from outcrops of the Cadomin Formation and coal seams of the Mist Mountain Formation
Further work	 The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	 While drilling activities are complete, the GWIL Birtley Calgary laboratory has now been provided with a large volume of coal core samples that require sample preparation, raw quality testwork, attrition and float sink testing, and clean coal testwork that will be ongoing. Interpretation of the geological data acquired this year will now be the focus, in order to update structure and coal quality models. The data acquired in the 2020 program will also support geotechnical, coal quality and washability requirements to support the planned PFS Palaris continues with the interpretation of data and updating 3D geological models of Isolation South, with an update to the resource estimate planned for Q4 2020.
