

ASX ANNOUNCEMENT

21st January 2021

High-grade Gold Results from Reedy South RC Drilling

HIGHLIGHTS

- ❖ Maiden RC drilling program (~4,500m) commenced at Reedy South in mid-November 2020. 38 out of 43 holes for ~3,000m have been completed, with 5 deeper RC holes remaining.
- ❖ Of the 11 holes assayed so far, significant results include:
 - **7m @ 3.16 g/t Au** from 53m (RSRC010)
 - **11m @ 2.29 g/t Au** from 21m (RSRC007)
 - **8m @ 1.06 g/t Au** from 48m and **16m @ 1.74 g/t Au** 72m (RSRC003)
 - **7m @ 1.5 g/t Au** from 48m (RSRC004)
- ❖ Results are consistent with the grade and thickness of historical drilling at the King Cole prospect, located in the northern part of the project.
- ❖ Assay results from 27 holes are currently pending.
- ❖ Drilling of the remaining 5 holes, which aims to extend mineralisation at depth at both King Cole and Pegasus, to commence in the coming weeks.

White Cliff Minerals Limited (**White Cliff** or the **Company**) is pleased to provide an update on our maiden reverse circulation (**RC**) drilling program at the Company's 100% owned Reedy South Gold Project (the **Project**) near Cue, Western Australia. The ~4,500m RC program commenced in mid-November 2020, with ~3,000m (38 of 43 holes) completed prior to the Christmas shutdown period. The RC rig will be remobilising at Reedy South towards the end of January to complete the deeper holes which will be targeting extensions to the mineral resource estimate (**MRE**) area.¹

Assay results have been received from 11 of the 38 holes drilled to date, covering the northern end of the King Cole prospect (**Figure 1**). The Company expects to receive the balance of the assay results from the completed holes in coming weeks.

Technical director Ed Mead commented, "The assay results received so far confirm the mineralised grade and thickness of historical drilling at the King Cole prospect which was part of the maiden MRE at Reedy South. Results from a further 27 completed holes are expected to further connect King Cole down to the Pegasus

¹ Refer ASX announcement 29 October 2020 for additional details

Prospect, with deeper drilling in January proving up interpreted extensions to mineralisation and the October 2020 MRE. The Emu South/Triton underground mine operated by Westgold is less than 600m from our northern tenement boundary, and along strike on the RSZ, with known resources down to 500m vertical. I see significant potential to continue to advance and grow our Cue assets."

King Cole and Pegasus Prospects, Reedy South

The King Cole prospect is at the northern end of M20/446, close to the tenement boundary with ASX-listed Westgold Resources Ltd (and ~600m from the South Emu pit), and sits along the Reedy Shear Zone (**RSZ**). The RSZ is a localised disconformable contact between two greenstone groups. Anastomosing structures develop within the RSZ that focus fluid migration and gold mineralisation. Strong potassic-silicic-pyritic alteration is associated with gold mineralisation and localised within the footwall and hanging wall contacts of the ~20m wide sub-vertical RSZ.

The Pegasus prospect, ~400m south west of King Cole, also sits along the RSZ and has been subject to historic underground workings. At Pegasus, gold mineralisation has been defined to ~70m depth and along 600m+ of strike length.

Maiden RC Drilling Program

The Company's maiden RC drilling program at the Reedy South Gold Project commenced in mid-November 2020. A total of 3,537m of a ~4,500m was completed prior to the Christmas shut-down period. The program consists of shallower (~60-80m) infill drill holes aimed at increasing resource confidence and testing strike extensions, and a series of deeper holes to target mineralisation at depth. Historical drilling, which was incorporated into the Company's maiden MRE (refer announcement 29 October 2020), averaged 60m in depth.

The Company has received assay results from 11 of the 38 completed holes, primarily around the King Cole prospect, with significant results including:

- **7m @ 3.16 g/t Au** from 53m (RSRC010)
- **11m @ 2.29 g/t Au** from 21m (RSRC007)
- **8m @ 1.06 g/t Au** from 48m and **16m @ 1.74 g/t Au** 72m (RSRC003)
- **7m @ 1.5 g/t Au** from 48m (RSRC004)

Overview of Reedy South

The Project covers 272km² of the highly prospective Cue goldfields, centred on the southern portion of the prolific Reedy Shear Zone, within the Meekatharra-Wydney greenstone belt.

The Project comprises one granted mining lease (M20/446) covering the historic underground workings of Pegasus and King Cole, a granted exploration and prospecting license (E20/938 & P20/2289) and four exploration license applications (E20/969, E20/971, E20/972 & E20/974). The Project is situated 40km north of Cue, via the Great Northern Highway and is 80km south of Meekatharra.

Competent Persons Statement

The Information in this report that relates to exploration results, mineral resources or ore reserves is based on information compiled by Mr Edward Mead, who is a Member of the Australian Institute of Mining and Metallurgy. Mr Mead is a director of the company. Mr Mead has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity that he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the 'Australian Code for Reporting Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Mead consents to the inclusion of this information in the form and context in which it appears in this report.

Forward Looking Information

This announcement contains forward looking statements concerning the Company. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward-looking statements as a result of a variety of risks, uncertainties and other factors. Forward-looking statements are inherently subject to business, economic, competitive, political and social uncertainties and contingencies. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information provided by the Company, or on behalf of the Company. Such factors include, among other things, risks relating to additional funding requirements, metal prices, exploration, development and operating risks, competition, production risks, regulatory restrictions, including environmental regulation and liability and potential title disputes. Forward looking statements in this announcement are based on the Company's beliefs, opinions and estimates of the Company as of the dates the forward- looking statements are made, and no obligation is assumed to update forward looking statements if these beliefs, opinions and estimates should change or to reflect other future developments. Although management believes that the assumptions made by the Company and the expectations represented by such information are reasonable, there can be no assurance that the forward- looking information will prove to be accurate. Forward-looking information involves known and unknown risks, uncertainties, and other factors which may cause the actual results, performance or achievements of the Company to be materially different from any anticipated future results, performance or achievements expressed or implied by such forward-looking information. Such factors include, among others, the actual market price of commodities, the actual results of future exploration, changes in project parameters as plans continue to be evaluated, as well as those factors disclosed in the Company's publicly filed announcements. Readers should not place undue reliance on forward-looking information.

The Company does not undertake to update any forward-looking information, except in accordance with applicable securities laws. No representation, warranty or undertaking, express or implied, is given or made by the Company that the occurrence of the events expressed or implied in any forward-looking statements in this announcement will actually occur.

APPENDIX 1.

The following Tables are provided to ensure compliance with the JORC Code (2012 Edition) requirements for the reporting of Exploration Results at the Reedy South Project.

Section 1: Sampling Techniques and Data

(Criteria in this section applies to all succeeding sections)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i>	Every metre drilled was sampled at the drill rig using a rig mounted static cone splitter to collect 2 – 3kg sub samples. 4m composites through the geologically determined non-mineralised zones were collected using the pipe/spear method of sampling the coarse reject sample collected in standard green bags, which remain at the drill site.
	<i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i>	Standard reference material, sample duplicates were automatically collected at 25m sample intervals from the cone splitter Where a duplicate, produced from the cone splitter, wasn't sampled due to it being in a non-mineralised zone, a 4m composite field duplicate was obtained using the pipe/spear method from the sample reject bag. This method maintained a ~25m duplicate and standard insertion rate throughout the entire program.
	<i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	A combination of 1m split for geologically identified mineralised zones and 4m composite samples for geologically identified waste zones were sent to the laboratory for crushing, splitting and analysis. Analysis was undertaken by ALS laboratories (Perth) for gold assay by 50g fire assay.
Drilling techniques	<i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic etc) and details (e.g. core diameter, triple of standard tube, depth of diamond tails, face-sampling bit or other type, whether core is orientated and if so, by what method, etc).</i>	RSRC001-37 were completed by reverse circulation drilling techniques using a slimline RC rig. Slimline RC utilises a drill bit diameter of 3.5 inches or 89mm. RSRC0038 was completed by reverse circulation drilling techniques using a standard 5.5 inch (143mm) diameter bit. A face sampling down hole hammer was used at all times.
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>	Drill recovery was routinely recorded via estimation of the comparative percentage of the volume of the sample bag by the company geologist. The sample recovery was deemed adequate for representative assays.
	<i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>	A qualitative estimate of sample weight was undertaken to ensure consistency of sample size and to monitor sample recoveries at the time of drilling..

	<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	Drill sample recovery and quality is considered to be adequate for the drilling technique employed.
Logging	<i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	All holes have been geologically logged for lithology, mineralisation and weathering. A brief description of each drilling sample was recorded and a permanent record has been collected and stored in chip trays for reference.
	<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	Lithology codes have been interpreted by a geologist for consistency across the project.

Criteria	JORC Code explanation	Commentary
	<i>The total length and percentage of the relevant intersections logged.</i>	Veining and mineralisation noted in lithological logs
Sub-sampling techniques and sample preparation	<i>If core, whether cut or sawn and whether quarter, half or all core taken.</i>	A sub sample from the RC drill rig of approximately 2-4kg was taken from the sample splitter off the cyclone. For holes drilled by Homestake, Murchison Mining and St Barbara samples were pulverised to 85% passing 75 microns. From this a 50g charge was taken for fire assay with AAS finish. These assaying techniques are considered appropriate for this style of mineralisation.
	<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	
	<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	
	<i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i>	No QAQC data is available for prior drilling campaigns by Wakefield.
	<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	The use of fire assay with 50g charge for all RC drilling provides a level of confidence in the assay database. The sampling and assaying is considered representative of the in-situ material.
	<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	The sample size of 2-4 kilograms is appropriate and representative of the grain size and mineralisation style of the deposit.
Quality of assay data and laboratory tests	<i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	ALS (Perth) were used for all analysis of drill samples submitted by Artemis. The laboratory techniques below are for all samples submitted to ALS and are considered appropriate for the style of mineralisation defined within the Carlow Castle Project area: Samples above 3Kg riffle split. Pulverise to 95% passing 75 microns 50-gram Fire Assay (Au-AA26) with ICP finish - Au. 4 Acid Digest ICP-AES Finish (ME-ICP61) – Ag, Al, As, Ba, Be, Bi, Ca, Cd, Co, Cr, Cu, Fe, Ga, K, La, Mg, Mn, Mo, Na, Ni, P, Pb, S, Sb, Sc, Sr, Th, Ti, Tl, U, V, W, Zn. Ore Grade 4 Acid Digest ICP-AES Finish (ME-OG62) Standards were used for external laboratory checks by WCN. Duplicates were used for external laboratory checks by WCN.
	<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	<i>The verification of significant intersections by either independent or alternative company personnel.</i>	Several drilling campaigns have been conducted at South Reedy since 1984. These campaigns with subsequent infill drilling provide verification of the significant intersections as they have been repeated along strike at distances as close as 10m.
	<i>The use of twinned holes.</i>	No twinned holes were drilled but several holes are in close proximity to each other illustrating continuity of mineralisation.
	<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	Electronic data capture, storage and transfer as .csv. Routine QC checks performed by contractor and independent geophysical consultant. Data were found to be of high quality and in accordance with contract specifications. Laboratory standards and blank samples were inserted at regular intervals and some duplicate samples were taken for QC checks.
	<i>Discuss any adjustment to assay data.</i>	No adjustments were made to assay data.
Location of data points	<i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	A Garmin GPSMap62 hand-held GPS was used to define the location of the drill hole collars. Standard practice is for the GPS to be left at the site of the collar for a period of 5 minutes to obtain a steady reading. Collar locations are considered to be accurate to within 5m. Hole collars will be picked up by licensed surveyors on completion of the drilling. GDA94 Zone 51 co-ordinates.
	<i>Specification of the grid system used.</i>	
	<i>Quality and adequacy of topographic control.</i>	

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	<i>Data spacing for reporting of Exploration Results.</i>	Collar information or the reported holes is provided. Rockchip samples were randomly collected and were appropriate given the objectives of the program.
	<i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	Intercepts given are downhole widths with the true widths not determined.
	<i>Whether sample compositing has been applied.</i>	Single metre sampling used within mineralised zones.
Orientation of data in relation to geological structure	<i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	Drill holes have generally been drilled perpendicular to the general strike and dip of the orebody. Holes in this announcement have been collared with lease boundary restrictions so have intersected the ore-zone at an oblique angle.
	<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	
Sample security	<i>The measures taken to ensure sample security.</i>	Sample security measures for historical drilling are unknown. The chain of custody is managed by the supervising geologist who places calico sample bags in polyweave sacks. Up to 10 calico sample bags are placed in each sack. Each sack is clearly labelled with: <ul style="list-style-type: none"> WhiteCliff Minerals Ltd

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> ○ Address of laboratory ○ Sample range ○ Samples were delivered by Whitecliff personnel to the transport company in Cue <p>The transport company then delivers the samples directly to the ALS laboratory.</p>
Audits or reviews	<i>The results of any audits or reviews of sampling techniques and data.</i>	<p>QA/QC data from the metallurgical testwork provides a high confidence in the recent RC drilling's assay data. Historical data has been extensively reviewed.</p> <p>Data is validated upon up-loading into the master database. Any validation issues identified are investigated prior to reporting of results.</p>

Section 2: Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i>	South Reedy is located on M20/446, registered in the name of Harley Sears (50%) and Wakeford Holdings (50%). White Cliff Minerals Ltd has purchased the tenement from the registered holders as announced to the ASX on 8 October 2020. There are no known impediments to the future exploration or mining of this deposit.
	<i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	Minimum expenditure requirement of \$10,000 per annum has been met for the current reporting period
Exploration done by other parties	<i>Acknowledgment and appraisal of exploration by other parties.</i>	Historical exploration has been conducted by Homestake Australia Ltd, St Barbara Ltd, Wakeford Holdings and Murchison Mining Pty Ltd. A total of 117 RC holes for 7,182m has been drilled. Data was compiled from WAMEX reports.
Geology	<i>Deposit type, geological setting and style of mineralisation.</i>	Mineralisation in the Mining Lease is hosted by the Reedy Shear Zone (RSZ) localised by a disconformable contact between two greenstone groups. Anastomosing structures develop within the RSZ focusing fluid migration and Au mineralisation. Strong potassic-silicic-pyritic alteration is associated with gold mineralisation localised within the footwall and hanging contacts of the 20m wide sub-vertical RSZ. Linear zones of more intense deformation appear to be important in the localisation of gold mineralisation within ultramafic zones often adjacent to mineralisation. Minor bucky quartz veining intrudes the shear and appears to run parallel to the shear zone.
Drill hole Information	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> • easting and northing of the drill hole collar • elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth • hole length. 	A summary of all exploration drilling and sampling is contained in tabulated data within this announcement.
	<i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	
Data aggregation methods	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg. cutting of high grades) and cut-off grades are usually Material and should be stated.</i>	Intersections have been calculated generally using a 1g/t cut off and internal waste of up to 2m thickness with total intercepts greater than 1g/t. No upper cut off has been applied to intersections or samples.

Criteria	JORC Code explanation	Commentary
	<i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i>	Only relevant elements (gold) are reported here. However, the samples underwent multi element assay as industry standard.
	<i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i>	No metal equivalent values are being used.
Relationship between mineralisation widths and intercept lengths	<i>These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i>	Reported intersection widths are generally greater than true widths by about 20% however this does vary within the deposit. Holes have generally been drilled perpendicular to strike. The orebody is sub-vertical with most holes drilled at -60° from horizontal.
Diagrams	<i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views.</i>	Location maps and drill cross sections are included in the body of this announcement.
Balanced reporting	<i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	The reporting of exploration results is considered balanced by the competent person. The locations of the drill holes are included in this release.
Other substantive exploration data	<i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	The Company's technical consultants are continuing to review available historical data, and WAMEX data over all WCN controlled tenements in the RSZ area.
Further work	<i>The nature and scale of planned further work (eg. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Following the delivery of the maiden MRE, and the maiden drill program, additional drilling is planned to infill the deposit to either grow the resource or upgrade the resource category and also to extend the deposit along strike and at depth.
