WHITE KNIGHT KAOLIN

WHITE CLOUD PROJECT

ASX ANNOUNCEMENT

8 February 2021

Mineral Resource Estimate update completed for 100% owned White Cloud Kaolin Deposit

- **An updated mineral resource estimate at Suvo's White Cloud Kaolin project has been completed and reported in accordance with the 2012 JORC Code and guidelines**
- **Total mineral resources are 39.5Mt of bright white kaolinised Granite, an increase of ~13% compared to the previous estimate (June 2020 - 35.1Mt)**
- **~22% increase in contained kaolin to 16.4Mt due to <45µm yield increase of ~9% to 41.6%, ISO brightness increase to 80.7%**
- **Mineral resource upgraded to 26.7Mt Indicated 26.7Mt 12.8Mt Inferred.**
- **Further results from extension drilling are due in March and expected to significantly increase the resources size**
- **Offtake agreements, well advanced with local and international customers, can now be finalised**
- **End user analysis including detailed target markets and potential off-take pricing imminent**
- **Updated mineral resources will be used in the pre-feasibility study being undertaken by Primero Group**

ASX ANNOUNCEMENT

Australian kaolin producer and silica sand exploration company, **Suvo Strategic Minerals Limited** ('Suvo or the Company'), is pleased to announce that laboratory results from its recently completed infill drilling program have now been incorporated in an updated White Cloud Mineral Resource estimate completed by CSA Global Pty Ltd ('CSA').

Commenting on the Resource upgrade, Suvo's Executive Chairman Robert Martin said 'The upgraded classification of Indicated Resources at White Cloud is the next step in our steady progression towards commencing operations at Gabbin. We can now progress and finalise potential off take agreements and work with our laboratories to determine the most economical and profitable product mix we can derive from the resource and feed this information to our engineers to evaluate optimum design and economic outcomes.

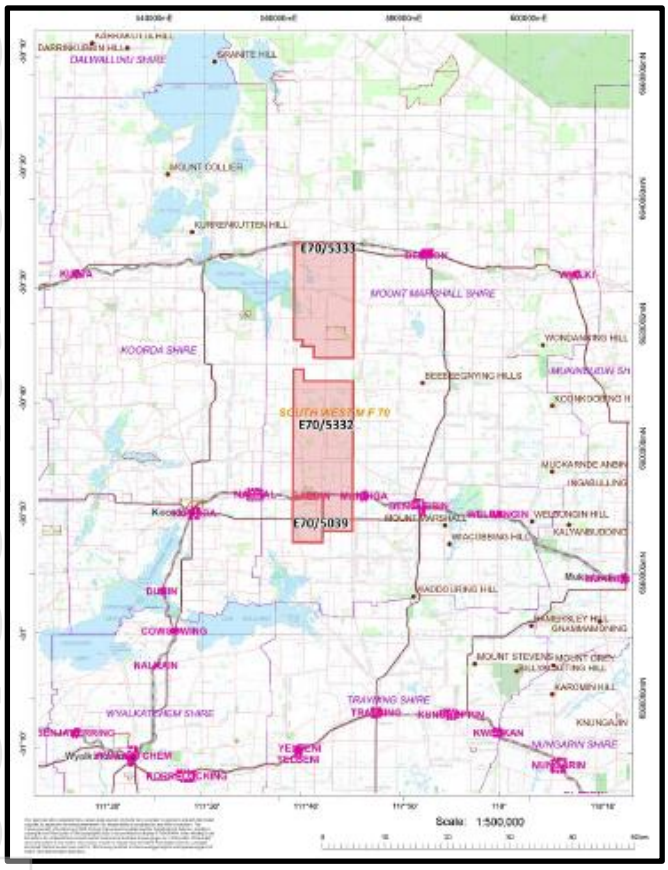

Figure 1 : White Cloud tenement and infrastructure location map

The White Cloud Project

The 100% owned White Cloud Project is located 215km northeast of Perth, Western Australia. The project area comprises three granted exploration licences for 392km^2 centred around the town and rail siding of Gabbin. The generally flat area is primarily cleared farming land devoid of native bushland and is currently used for broad-acre cereal crops. A mining access agreement is in place over the current resource area with the land owner and occupier.

The main rock types at White Cloud are primarily Archaean granite, gneiss, and migmatite. These rocks are overlain and obscured by Tertiary sand and Quaternary sheetwash. The weathering profile is very deep and contains thick kaolin horizons capped by mottled clays or laterite zones.

Infill Drilling

Infill resource definition drilling started in October 2020 saw the completion of 76 aircore drillholes for 1,608 metres of drilling within the previously defined Inferred Mineral Resource, with the aim of upgrading the resource classification.

Most of the infill drillholes intersected bright white kaolinised granite starting between 2 and 6 metres below surface. Four holes stopped short due to impenetrable cemented caprock and will be completed at a later stage due to promising intersects. A total of 124 composite samples, including 11 field duplicates, were delivered to Nagrom Laboratories for testing. Nagrom analysed the samples and determined yield values via mass balance following sizing to <45μm, ISO brightness values determined by reflectance meter and values for Al_2O_3, SiO_2, Fe_2O_3, TiO_2 and LOI by XRF.

These laboratory results along with survey and QA/QC data was transmitted to CSA for a Mineral Resource estimate update.

The figure below shows the location of infill drilling within the original June 2020 Mineral Resource estimate outline.

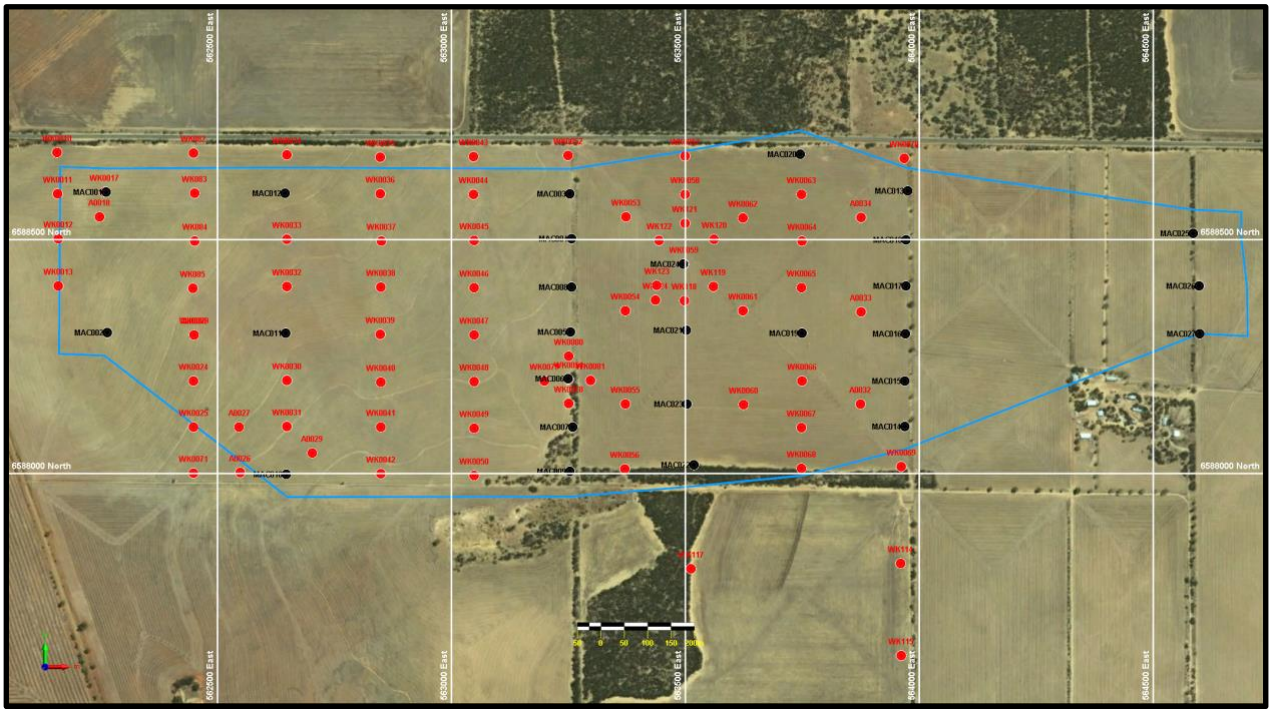

Figure 2 : Existing White Cloud Resource outline June 2020 (Blue), existing drilling (black), infill drilling completed November 2020 (red)

Mineral Resource Estimate February 2021

A Mineral Resource estimate was completed by CSA in February 2021 in accordance with the 2012 JORC code and guidelines.

Following on from the previous White Cloud iteration completed in June 2020, an Inverse Distance Weighting (IDW) method was chosen to interpolate ISO Brightness (457 nm), yield <45µm, Al_2O_3, SiO_2, Fe_2O_3, TiO_2 and loss on ignition (LOI) values.

Category	Number of Records for holes used in MRE 2020	Number of Records for additional holes
Drill holes	27	76
Metres drilled	646	1,608
Sample intervals	120	244
Lithological codes	119	184
Including analytical values:		
Brightness > 0	52	124
Yield (<45 µm) > 0 %	52	124

Category	Number of Records for holes used in MRE 2020	Number of Records for additional holes
$Al_2O_3 > 0$ %	52	124
$SiO_2 > 0$ %	52	124
$Fe_2O_3 > 0$ %	52	124
$TiO_2 > 0$ %	52	124
LOI > 0 %	52	124

Table 1 : White Cloud data June 2020 and February 2021

A singular domain was utilised for the white kaolinized granite and this domain was assigned an in-situ bulk density value of 1.8t/m^3.

Total Mineral Resources now stand at 39.5Mt of bright white kaolinised granite representing a 13% increase over those previously reported in June 2020 (35.1Mt). As the majority of the drilling was infilling and only some minor drilling on the periphery of the previous resource, this shows the excellent homogeneity within the White Cloud deposit.

ISO Brightness has marginally increased to 80.7% while the <45µm yield increases 9% to 41.6% which results in a 22% increase of contained kaolin to 16.4Mt.

Infill drilling has increased the confidence in the resource estimate moving the majority of tonnes from Inferred into Indicated. Indicated resources are now 26.7Mt while Inferred are 12.8Mt.

The figure below shows the current 2021 Resource Model with the blocks coloured by brightness productivity in the white kaolinised granite. Brightness productivity is the brightness multiplied by the thickness and thus shows the thicker, brighter zones of the deposit.

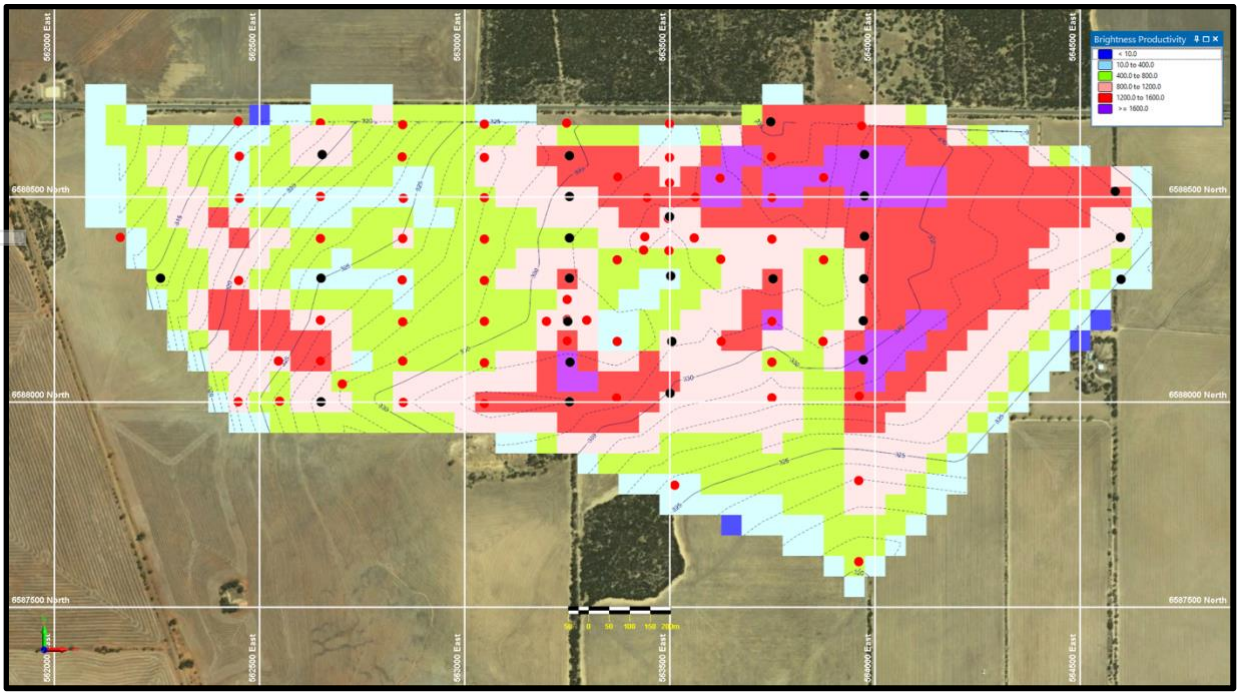

Figure 3 : 2021 White Cloud Resource coloured by brightness productivity, existing drilling (black), infill drilling completed November 2020 (red)

The figure below shows the current 2021 Resource Model with the blocks coloured by yield productivity in the white kaolinised granite. Yield productivity is the yield multiplied by the thickness and thus shows the thicker higher yielding zones of the deposit.

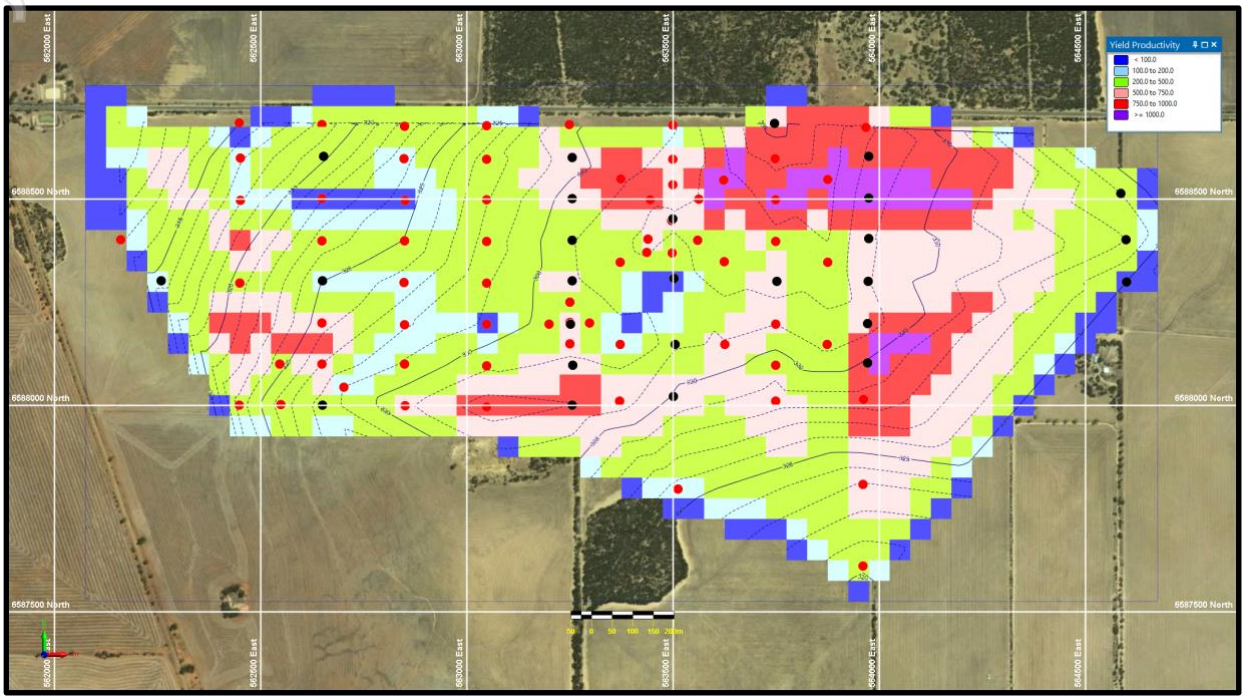

Figure 4: 2021 White Cloud Resource coloured by yield productivity, existing drilling (black), infill drilling completed November 2020 (red)

Below is a summary of tabulated results from the existing June 2020 and current February 2021 Mineral Resource Estimates for comparison.

January 2021 Mineral Resource Estimate					June 2020 Mineral Resource Estimate				
Category	Tonnes Kt	ISO Brightness (457 nm)	Yield <45um %	Tonnes Kt	Category	Tonnes Kt	ISO Brightness (457 nm)	Yield <45um %	Tonnes Kt
Indicated	26.7	80.9	41.5	11.1	Indicated	-	-	-	-
Inferred	12.7	80.5	42.5	5.4	Inferred	35.1	80.3	38.2	13.4
TOTAL	**39.5**	**80.7**	**41.6**	**16.4**	**TOTAL**	**35.1**	**80.3**	**38.2**	**13.4**
Change	**+13%**	**-**	**+9%**	**+22%**					

Table 2 : White Cloud resource comparison June 2020 vs February 2021

The completion of this Mineral Resource estimate allows the prefeasibility study to continue unabated. This will allow the determination of optimal mining, processing and logistical infrastructure for the development of White Cloud. Additionally, offtake agreements can also now be finalised.

Extension Drilling

A program of extension drilling was completed at White Cloud during December 2020. This drilling was designed to target extensions mainly to the south of the current resource area.

Three lines of drilling to the south were completed with the longest of these extending approximately 2km south from the current resource outline, some drilling was also completed adjacent to this main line oriented east – west.

This program saw the completion of 31 aircore drill holes, for 404 metres. All of the drillholes that reached target depth intersected bright white kaolinised granite, with the remainder stopped short due to impenetrable cemented caprock. These will be completed at a later stage due to promising intercepts.

A total of 40 composite samples taken from the extension drilling have been sent to Nagrom Laboratories for testing. Nagrom will determined yield values via mass balance following sizing to <45µm, ISO brightness values by reflectance meter and values for Al_2O_3, SiO_2, Fe_2O_3, TiO_2 and LOI by XRF.

The figure below shows the 2021 Mineral Resource estimate outline and the extension drilling to the south that was completed in December 2020. Also visible approximately 3.5km to the north is the town of Gabbin, its railway siding and associate infrastructure, that is the subject of an agreement between Suvo and CBH Group signed in October 2020. Suvo will be accessing the railway reserve leases, a 20,000 tonne storage shed, road and rail loading facilities, offices, on-site accommodation, power and water connections with excess land for lay down facilities, for use as a processing plant and logistics hub.

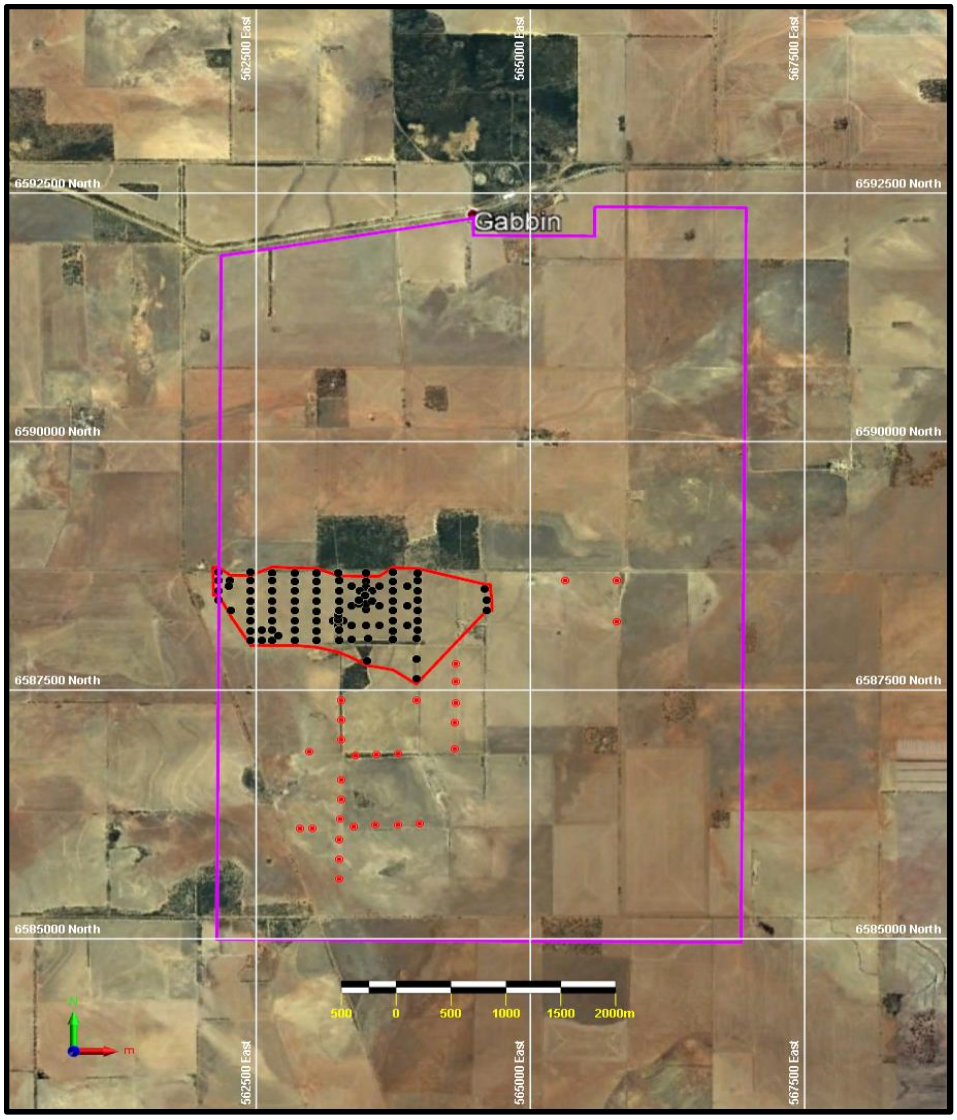

Figure 5 : White Cloud Mineral Resource Estimate outline February 2021 (red line), extension drilling completed December 2020 (red), all other drilling (black)

The analytical results from the December 2020 extension drilling are expected in the coming weeks and will be compiled by CSA for the purpose of a further update to the Mineral Resource Estimate. It is expected that this update will add significant tonnes to the total resources.

This announcement has been approved for release by the Board of Directors.

Company Profile:

Suvo Strategic Minerals Limited is an Australian hydrous kaolin producer and exploration company listed on the Australian Securities Exchange (ASX:SUV). Suvo is focused on production at, and redevelopment of, their 100% owned Pittong hydrous kaolin operation located 40km west of Ballarat in Victoria. Suvo's exploration focus is on their 100% owned White Cloud Kaolin Project located adjacent to Gabbin in the Central Wheat Belt, and the 100% owned Nova Silica Sands Project located in the Gin Gin Scarp near Eneabba, both situated in Western Australia.

Pittong Operations

The 100% owned Pittong Operation, located in Victoria 40km west of Ballarat, is the sole wet kaolin mine and processing plant in Australia and has been in operation since 1972. Pittong comprises the Pittong, Trawalla and Lal Lal deposits located on approved Mining Licences MIN5408, MIN5365 and MIN5409 respectively.

At Pittong mining contractors deliver crude kaolin ore to stockpiles from the two currently operating mines, Pittong and Lal Lal. The plant takes its feedstock from the ROM and it is processed into four separate products for end users. These products are 10% moisture lump, high solids slurry, 1% moisture powder and 1% moisture pulverised powder. The solids slurry is used in paper and board manufacturing. The other products are used in paper, coatings, paint and specialist industries including rubber and pharmaceutical applications. Around 25kt per annum is supplied to various end users.

Current Reserves and Resources at Pittong are reported to PERC code standard and they are currently being upgraded to JORC 2012 compliance.

The White Cloud Project

The 100% owned White Cloud Project is located 215km northeast of Perth, Western Australia. The project area comprises three granted exploration licences (E70/5039, E70/5332, E70/5333) for 392km^2, and one exploration licence application (E70/5517) for 21km^2 centred around the town and rail siding of Gabbin.

The generally flat area is primarily cleared farming land devoid of native bushland and is currently used for broad-acre cereal cropping. A mining access agreement is in place over the current resource area with the land owner and occupier.

The main rock types at White Cloud are primarily Archaean granite, gneiss, and migmatite, these rocks are overlain and obscured by Tertiary sand and Quaternary sheetwash. The weathering profile is very deep and contains thick kaolin horizons capped by mottled clays or laterite zones. The current JORC 2012 Mineral Resources are 39.4Mt of bright white kaolinised granite with at ISO Brightness of 80.7%, <45μm yield of 41.8% resulting in 16.5Mt of contained kaolin.

Nova Silica Sands Project

The 100% owned Nova Silica Sands Project is located 300km north of Perth, Western Australia. The project comprises three granted exploration licences (E70/5001, E70/5322, E70/5323) for 133km^2, and one exploration licence application (E70/5324) for 36km^2.

The project is located on the Eneabba Plain whose sandy cover is very flat to gently undulating. Outcrop is rare due to the accumulations of windblown and alluvial sand at surface. Below this is a thin hard silcrete or lateritic claypan which overlies deep white and yellow sands.

Preliminary exploration has included 54 drillholes for 1,620 metres to depths of up to 30m. This program is anticipated to deliver an initial resource for the project and a process route.

ASX ANNOUNCEMENT

Competent Person Statements

The information in this announcement which relates to Exploration Results and Mineral Resources is based on information compiled by Dr Ian Wilson. Dr Ian Wilson has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a competent person as defined in the JORC Code, by virtue of his being a member of IOM3, a Recognised Professional Organisation. Dr Ian Wilson is a full-time employee of Ian Wilson Consultancy Ltd and also a Non-Executive Director of Suvo Strategic Minerals Limited. Dr Ian Wilson receives board fees in relation to his directorship. Dr Ian Wilson consents to the inclusion of the information in the release in the form and context in which it appears

The geological modelling included in the Mineral Resource Report was prepared, and fairly reflects information compiled, by Mr Serik Urbisinov and Dr Andrew Scogings, each of whom have sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which they are undertaking to qualify as Competent Persons as defined in the 2012 edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (the JORC Code). Mr Urbisinov is a full-time employee of CSA Global Pty Ltd and is a Member of the Australian Institute of Geoscientists. Dr Andrew Scogings is an employee of Klipstone Pty Ltd and a consultant to CSA Global Pty Ltd, a Member of both of the Australasian Institute of Mining and Metallurgy ("AusIMM") and the Australian Institute of Geoscientists ("MAIG") and is a Registered Professional Geoscientist (RP Geo. Industrial Minerals). Mr Serik Urbisinov and Dr Andrew Scogings consent to the inclusion of information in the Mineral Resource Report that is attributable to each of them, and to the inclusion of the information in the release in the form and context in which they appear.

8 February 2021

ASX ANNOUNCEMENT

JORC Table 1

Section 1: Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC-Code Explanation	Commentary
Sampling techniques	*Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc).*	*Aircore drilling program was conducted to investigate and quantify the kaolin on the property.* *The datasets used to establish the resource were derived from three drilling campaigns conducted in 2019 and 2020. The total program consisted of 131 aircore drillholes for 2624m of drilling, of which 103 holes for 2524m were within the current Mineral Resource limits. 79 drillholes had both lithology logging and laboratory assay results. 18 drillholes had lithology descriptions, but without assay data. 6 drillholes had no lithology and no assay data from which four drillholes were abandoned due to the ground conditions (WK0029, WK0057, WK0078, and WK0114)* *Samples are stored at a secure storage facility.* *Aircore drill samples were collected at 1 m intervals. The sample of approximately 3kg each was collected directly from a splitter attached to the cyclone on the Mantis Drill Rig (2019). Sample collection performed during the Outback Drilling (2020) used plastic hand trowel after manual homogenisation. Sample quality and representivity was acceptable and no significant loss of sample through hole blowouts or the like occurred. Drilling and sampling continued to rig refusal or to a non-kaolinitic domain change.*
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	
Drilling techniques	*Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	*Drillholes MAC001 to MAC027 were completed by Wallis Drilling Pty Ltd using a Mantis 200 AC rig fitted with an 86-mm air core face sampling bit. All other drillholes were completed by Outback Drilling Pty Ltd using a KL150 aircore rig using 83mm aircore bits and 73mm ARD drill rods*
Drill sample recovery	*Method of recording and assessing core and chip sample recoveries and results assessed.*	*A qualitative assessment of sample recovery was made by the supervising geologist during drilling. Samples were geologically logged and recovery was again assessed. Most samples were dry and recovery complete. Occasionally sample return required air adjustments during drilling to maximise recovery and*
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	

Criteria	JORC-Code Explanation	Commentary
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	*reduce clay build-up between the sample face and the cyclone. To ensure sample quality and integrity was maintained, the drill string, cyclone and sample return hose was cleaned several times during each drillhole with particular attention to this process in areas where clay moisture increased.* *There was no evidence of bias in the samples.*
Logging	*Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.*	*Samples were geologically logged for all intervals by an experienced geologist on-site at the time of drilling.* *Logging noted the lithology, colour, degree of weathering and alteration.* *Photographs were taken of the chip trays and, during the 2020 program, the individual 1 m samples.* *Field logging of aircore drill samples was qualitative.* *100% of relevant kaolin intersections were logged and sampled.*
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	
	The total length and percentage of the relevant intersections logged.	
Sub-sampling techniques and sample preparation	*If core, whether cut or sawn and whether quarter, half or all core taken.*	*Each 1 m interval was collected from the cyclone underflow in drillholes MAC001 to MAC027. Samples from the splitter were approximately 4 kg each and consistent lithologically save for the transition zones between domains. No significant sample loss was recorded, and the samples are considered representative. Samples were collected directly from a splitter attached to the cyclone for the MAC series drillholes. All other drillholes (WK series and A Series) were homogenised manually within the sample bag. The 1-metre interval sample bags weighed approximately 5-8 kg each. Composites were prepared using weighted subsamples of the intervals post manual homogenisation using a pvc tube or long trowel.* *Sample size collected from the cyclone represented approximately 60% of the total volume. There is little*
	If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.	
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	
	Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.	

Criteria	JORC-Code Explanation	Commentary
	Whether sample sizes are appropriate to the grain size of the material being sampled.	*variation between each 1m sample within a particular domain.* *Field samples and composites were all sufficiently dry to obtain a representative sample.* *Little variance occurs within individual kaolinitic domains which are generally over 5m thick. Thus manual homogenisation of 1m metre intervals within these domains followed by subsampling of each 1m interval equally to obtain a representative composite sample of each domain is deemed appropriate and representative.*
Quality of assay data and laboratory tests	*The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.*	*Metallurgical testing was carried out at two laboratories. Some duplication of testing was performed to compare results. Full quantitative chemical analysis of screened products was carried out with a Panalytical Zetium, XRF at Nagrom, Kelmscott, WA. Reported are % SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, Na_2O, K_2O, P_2O_5, Mn_3O_4, Cr_2O_3, BaO, ZrO_2, ZnO, V_2O_5, SrO and LOI (Loss on ignition at 1000deg C). Testing of the first-round drill samples (MACxxx series) was performed by First Test Minerals in the UK, the processes therein having been previously reported.* *Duplicate aircore samples were prepared on site and tested at Nagrom.* *Sample preparation of kaolinised granite consisted of crushing to P100/10mm then wet attritioning at 50% w/w solids for 30 minutes using a double propeller D12 Joy Denver mill at 800rpm.* *This is followed by Wet Screening to -0.18mm and -0.045mm then drying at 110°C. The dry fractioned samples are weighed then riffle split to obtain a 1kg sample for analysis. The remainder is rebagged and stored. Analysis of each fraction consists of XRF measurements for SiO_2, Al_2O_3, Fe_2O_3, TiO_2, CaO, MgO, Na_2O, K_2O, P_2O_5, Mn_3O_4, Cr_2O_3, BaO, ZrO_2, ZnO, V_2O_5, SrO and LOI followed by ISO Brightness & Yellowness.* *Dr Andrew Scogings, a consulting geologist subcontracted to CSA Global, Perth, carried out site visit to Nagrom to verify the sample preparation and testing methods during 2020 drilling.*
	For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	
	Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	
Verification of sampling and assaying	*The verification of significant intersections by either independent or alternative company personnel.*	*Dr Andrew Scogings, a consulting geologist subcontracted to CSA Global, Perth, carried out a one-day site visit during the September 2020 drilling.* *Three of the 2019 holes were twinned during the 2020 program.* *Field data was collected in both field notebooks and log sheets, then manually entered into spreadsheets and*
	The use of twinned holes.	
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	

Criteria	JORC-Code Explanation	Commentary
	Discuss any adjustment to assay data.	*validated in Micromine. No adjustments were made to assay data.*
Location of data points	*Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	*All drillholes and tracks were picked up using a Garmin GPSmap 62S. Drillhole collars were recorded using the MGA94 Zone 50 grid.* *128 drill collars were surveyed by Southern Cross Surveys Pty Ltd using Topcon mm GPS with specifications of +/-10mm N & E and +/-15mm Z. Survey data was compared to the handheld field GPS data to verify the surveyed names and positions.* *All holes were vertical and, with an average hole depth of only 20m downhole surveying was not considered necessary*
	Specification of the grid system used.	
	Quality and adequacy of topographic control.	
Data spacing and distribution	*Data spacing for reporting of Exploration Results.*	*The drilling was performed on section lines orthogonal to the MGA94 grid. A nominal drill spacing of 100m x 600m was used in the initial MAC series drillholes which defined the priority target area,* *Infill drilling in the northern block reduced line spacing to 200m and hole spacing to 100m to upgrade the resource classification.* *Infill drilling at 50 to 75m spacing was carried out in a cross-shaped pattern around two of the twin pairs to assess short-range variability.* *Extension drilling was performed to define the extent of the larger inferred resource area extending up to approximately 2,000 m south of the main resource area. Two of these holes were used to inform the current Mineral Resource estimate. The extension drilling was completed along farm tracks and fence lines with a hole spacing of 200m and a nominal line spacing of 600m.* *The sampling is considered appropriate to accurately define domains characterised by vertical changes in the weathering profile.* *Sample composites were produced from original 1m samples. Composites comprised equally weighted intervals collected by quartering or spearing homogenised samples of each of the 1m samples. Composites were based on kaolinite brightness and colour.*
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	
	Whether sample compositing has been applied.	
Orientation of data in relation to geological structure	*Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.*	*All drill holes are assumed vertical, which means that the sampling is orthogonal to the horizontal to sub horizontal kaolin zones.* *Orientation-based sampling bias is not expected from vertical drillholes.*
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	
Sample security	*The measures taken to ensure sample security.*	*Samples have been in the care of Company personnel during drilling, transport from the field and into Company storage facility*

Criteria	JORC-Code Explanation	Commentary
Audits or reviews	*The results of any audits or reviews of sampling techniques and data.*	*The field program was managed and supervised by Dean de Largie who is a Fellow of the Australian Institute of Geoscientists.*

Section 2: Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC-Code Explanation	Commentary
Mineral tenement and land tenure status	*Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and* *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	*The tenement is a Granted Exploration License. Tenement Number E70/5039. It is located 15km east of Koorda in Western Australia. The Tenement is held by Mt Marshall Kaolin Pty Ltd.* *There are no known impediments to operate on the tenements.*
Exploration done by other	*Acknowledgment and appraisal of exploration by other parties.*	*No previous exploration for kaolin has been identified*
Geology	*Deposit type, geological setting and style of mineralisation.*	*The White Cloud kaolin deposit is formed from the weathering of coarse-grained granite composed of quartz and feldspar with minor amounts of mica and other constituents. Kaolinite is a layered alumino-silicate clay mineral. The feldspar in the granite has been altered to kaolinite during the weathering process.* *The weathering process appears to relate to historical water table movement, which formed a residual 'hardcap' possibly re-cemented immediately below the overburden. Although relatively thin, this layer was at times impenetrable for the aircore drilling rigs. Thus, several holes were abandoned at this depth. Where the layer was penetrated, kaolin was intersected.*
Drill hole Information	*A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* *easting and northing of the drill hole collar* *elevation or RL (Reduced Level – elevation above sea level in meters) of the drill hole collar* *dip and azimuth of the hole* *down hole length and interception depth* *hole length.* *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	*The overburden of moderately pisolitic ferruginous soils is generally 4m to 7m thick. White kaolinite zones were generally 10m to 15m thick.* *All holes were drilled vertically to an average depth of 20 m.* *Drillhole collar information is included within the text and appendix of the report.*

Criteria	JORC-Code Explanation	Commentary
Data aggregation methods	*In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.*	*Aggregation and averaging have not been used*
	Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	
Relationship between mineralisation widths and intercept lengths	*These relationships are particularly important in the reporting of Exploration Results.*	*The kaolin is hosted within a horizontal near-surface weathering profile. It is an in-situ weathered product of a granitic intrusive rock. The weathering profile is zoned vertically. Drillholes are all vertical. Reported widths of kaolin are approximately true widths.*
	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	
	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	
Diagrams	*Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar.*	*Drill collar maps and appropriate sections are included in the Report*
Balanced reporting	*Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of*	*All available exploration results are reported in the Report. .*
Other substantive exploration data	*Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater*	*All material exploration data has been used and reported.*
Further work	*The nature and scale of planned further work (eg tests for lateral extensions or depth*	*Diamond core drilling is planned to twin selected aircore holes, to obtain undisturbed core samples to verify geology, mineralogy and metallurgy results, and to measure in situ bulk density by the Archimedes and calliper methods.*
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	

Section 3: Estimation and Reporting of Mineral Resources

Criteria	JORC Code explanation	Commentary
Database integrity	*Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.*	*Data used in the Mineral Resource estimate is sourced from Microsoft Excel files provided by SUVO Strategic Minerals All data*
	Data validation procedures used.	

Criteria	JORC Code explanation	Commentary
		was validated in Micromine software and verified that all the available data was submitted. *Validation of the data import include checks for overlapping intervals, missing survey data, missing and incorrectly recorded assay data, missing lithological data and missing collars.* *Manual checks were carried out by plotting and review of sections and plans.*
Site visits	*Comment on any site visits undertaken by the Competent Person and the outcome of those visits.* *If no site visits have been undertaken, indicate why this is the case.*	*The Competent Person Dr Ian Wilson (MIMMM) who is UK-based was unable to visit the project area due to Covid-19 travel restrictions. Dr. Andrew Scogings, a consulting geologist employed by KlipStone Pty Ltd and subcontracted to CSA Global, Perth, carried out a one-day site visit during the September 2020 drilling. Dr Andrew Scogings visited the Welshpool sample storage facility with Mr Dean de Largie and inspected a selection of drill chip trays and samples during May 2020.*
Geological interpretation	*Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.* *Nature of the data used and of any assumptions made.* *The effect, if any, of alternative interpretations on Mineral Resource estimation.* *The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology.*	*The geological interpretation of the kaolin deposit at White Cloud is well understood, and the logged lithologies are coherent and is traceable over numerous drill holes and drill sections.* *Drillhole intercept logging and assay results have formed the basis for the geological interpretation.* *The grade and lithological interpretation forms the basis for modelling. Lithological envelopes defining prospective WKG zone within which the grade estimation has been completed.* *The deposit is an in-situ kaolin deposit formed by near-surface weathering of granitoid rocks. The deposit does not lend itself readily to alternative interpretations, and as such they are unlikely to have a material impact on the results.* *The lithological units are recognised based on mineralogy, chemistry and colour.* *The lithological units are recognised based on mineralogy and colour.* *Resource estimation assumes that these units formed a series of conformable, sub horizontal, pseudo-stratified, in situ -weathering units.*
Dimensions	*The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.*	*The mineralised zone extends approximately for 2,600 m in easting and ranges between 400 m to 1,20m0 m in width along northings. The average vertical thickness is 11m for WKG. Overburden thickness is reasonably consistent 4m to 6m.*
Estimation and modelling techniques	*The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen, include a description of computer software and parameters used* *The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.* *The assumptions made regarding recovery of by-products.* *Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation).*	*The mineralisation interpretation was extended perpendicular to the corresponding first and last interpreted cross section to the distance equal to a half distance between the adjacent exploration lines.* *If a mineralised envelope did not extend to the adjacent drill hole section, it was pinched out to the next section and terminated. The general direction and dip of the envelopes was maintained.* *The size of the parent block used in creating the block model was selected on the basis of the exploration grid (100 by 200 m), the general morphology of mineralised bodies, and with due regard for the geology of the weathering profile and the high vertical grade variability and to avoid creating excessively large block models. The sub-block dimensions were chosen accordingly to maintain resolution of the mineralised bodies* *The block model was constructed using a 50 m E x 50 m N x 5 m RL parent block size, with subcelling to 10 m E x 10 m N x 1 m RL for domain volume resolution.* *Input data did not display significant outliers in their distributions and so no top-cuts were applied.*

Criteria	JORC Code explanation	Commentary
	In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.	*Grade estimation was by Inverse Distance Weighting (IDW^2) using Micromine 2018 software.* *Kaolin mineralisation is considered to have formed as a weathering product within the regolith horizon, and envelopes as modelled are constrained by this lithological horizon.* *The wireframe objects were used as hard boundaries for grade interpolation.* *The block model of the deposit with interpolated grades was validated both visually and by statistical/software methods.*
	Any assumptions behind modelling of selective mining units.	
	Any assumptions about correlation between variables	
	Description of how the geological interpretation was used to control the resource estimates.	
	Discussion of basis for using or not using grade cutting or capping.	
	The process of validation, the checking process used, the comparison of model data to drillhole data, and use of reconciliation data if available.	
Moisture	*Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	*Tonnages have been estimated on a dry in situ basis. No moisture values were reviewed.*
Cut-off parameters	*The basis of the adopted cut-off grade(s) or quality parameters applied.*	*The grade and tonnages are presented at a range of cut-off grades from 0 to 80 ISO Brightness for elements considered to be important in the choice of treatment processes (yield <45 µm fraction, Al_20_3, Fe_2O_3, SiO_2, TiO_2)*
Mining factors or assumptions	*Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	*It is assumed that due to the very shallow / near surface nature of the deposit, it will be mined by open pit methods.*
Metallurgical factors or assumptions	*The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.*	*Process testwork was carried out in accordance with kaolin industry standard methods for this type of deposit. For further details see Section 1 of this table under JORC criteria 'Sub-sampling techniques and sample preparation'.* *176 down-hole composites were tested and used for the current Mineral Resource estimation. These tests verified that the WKG kaolin has a minus 45 micron fraction yield of approximately 40% (range ~12-72%). Brightness values had a median of approximately 82 (range ~62-89).*
Environmental factors or assumptions	*Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields*	*The deposit is situated under cultivated land that has been cleared of native vegetation, hence no environmental factors or assumptions were made at this stage.*

Criteria	JORC Code explanation	Commentary
	project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered, this should be reported with an explanation of the environmental assumptions made.	
Bulk density	*Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.*	*CSA Global assigned a density of 1.8 t/m^3 to the WKG zone. This bulk density value was assumed from analogous deposits, from various public reports and news releases and industry experience of the Competent Person Dr Ian Wilson (MIMMM).*
	The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc.), moisture and differences between rock and alteration zones within the deposit.	
	Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.	
Classification	*The basis for the classification of the Mineral Resources into varying confidence categories.*	*The Mineral Resource was classified as Inferred and Indicated, taking into account the level of geological understanding of the deposit, quality of samples, density data, drillhole spacing and sampling and assaying processes.* *The classification reflects the level of data available for the estimate including input drillhole data spacing, the high level of geological continuity of the particular style of deposit.* *The MRE appropriately reflects the view of the Competent Person.*
	Whether appropriate account has been taken of all relevant factors (i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).	
	Whether the result appropriately reflects the Competent Person's view of the deposit.	
Audits or reviews	*The results of any audits or reviews of Mineral Resource estimates.*	*Internal audits were completed by CSA Global which verified the technical inputs, methodology, parameters and results of the estimate.* *No external audits have been undertaken.*
Discussion of relative accuracy/ confidence	*Where appropriate, a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.*	*The Mineral Resource accuracy is communicated through the classification assigned to the deposit. The MRE has been classified in accordance with the JORC Code (2012 Edition) using a qualitative approach. All factors that have been considered have been adequately communicated in Section 1 and Section 3 of this table.* *The Mineral Resource statement relates to a global estimate of in-situ tonnes and grade.* *No mining activity has been on the deposit.*
	The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.	
	These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.
