

ASX Release

Release Date: 11 February 2021

ASM Produces Rare Earth Permanent Magnets at Korean Institute of Rare Metals Facility

Highlights:

- Two kilograms of pre-sintered permanent magnets successfully produced from ASM's high-purity neodymium-iron-boron (NdFeB) powder
- Magnetic properties and quality confirmed by the Korean Institute of Rare Metals (KIRAM)

Australian Strategic Materials (ASX: ASM) (**ASM**) reports that the Korean Institute of Rare Metals (KIRAM) has successfully produced and tested two kilograms of pre-sintered permanent magnets from ASM's high-purity neodymium-iron-boron (NdFeB) powder from its pilot plant in Korea.

KIRAM's testing provides a strong indication that ASM's NdFeB alloy is suitable to produce rare earth permanent magnets that are commercially in demand. This certification is further validation of ASM's strategy to become an independent, fully integrated "mine to manufacturer" producer of critical metals.

ASM managing director, David Woodall said, "The excellent support and collaborative work between the Ziron Tech and KIRAM teams delivered a truly significant result. It provides ASM with confidence that our integrated business model – from the Dubbo Project to metals production – can play an important part in the Korean Government's 'New Green Deal'.

"We now have confirmation of the quality and high purity of the permanent magnet alloy and titanium powders ASM can deliver to the Korean industry and eventually the global markets. ASM is now planning to advance in the next few months with the detailed engineering, incorporating both the recently produced titanium and now the permanent magnet powders as part of an initial 5,200 tonnes per year plant in Korea, projected to be fully operational by mid-2022. This is a very significant transition for the company as we continue to progress the development of the Dubbo Project in the central western, NSW."

Methodology

KIRAM scientists made a strip-cast sample using five kilograms of the NdFeB powder produced by ASM's Ziron Tech team. The strip was then examined using scanning electron microscopy (SEM) and Energy Dispersive X-Ray Spectroscopy (EDS) to confirm the microstructure (Figure 1) and magnetic orientation.

Figure 1 – NdFeB strip alloy produced from Ziron Tech power (SEM/EDS result)

Some of the Ziron Tech NdFeB alloy was pressed into a two-kilogram block to measure the magnetic characteristics using VSM (Vibrating Sample Magnetometry) and compared with a similar sample made from a commercially available alloy. These tests (Figure 2) indicated that ASM's pre-sintered magnet exhibited superior magnetic properties than the commercial sample.

Figure 2 – Results of Vibrating Sample Magnetometer (VSM) tests comparing the Ziron Tech pre-sintered alloy with a commercially available powder.

About Australian Strategic Materials – www.asm-au.com

Australian Strategic Materials Ltd (ASM) is an integrated materials business and emerging “mine to manufacturer” producer of critical metals. The company’s cornerstone Dubbo Project (100% owned) is a proven long-term resource of rare earths, zirconium, niobium, and hafnium located in central-western NSW, Australia. It represents an alternative, sustainable and secure source of these metals, which are critical for a diverse range of advanced and clean technologies.

ASM’s metals business is founded on a novel metallisation process that converts oxides into high-purity metals, alloys, and powders using less energy than conventional methods. The pilot plant in South Korea has proven the commercial scalability of the process and successfully produced a range of high-purity metals and alloys, including titanium, neodymium, praseodymium, dysprosium, and zirconium. Following this success, ASM’s first metallisation plant will be constructed in South Korea to supply a range of critical metals including rare earths, zirconium, and titanium.

A Dubbo Project optimisation study will be completed by the end of Q1 2021, targeting improved capital and operating costs, along with an increased revenue stream. Elements of this optimisation study include simplifying the flowsheet, increasing recoveries of rare earths, and potentially including a front-end flotation circuit.
