

# OUTSTANDING HIGH-GRADE GOLD RESULTS FROM SPLIT ROCKS PROJECT

New outstanding high-grade gold drill results received from the first 36 aircore (AC) holes of a 100-hole program (totalling 4,732 metres) at the Split Rocks gold project in Western Australia.

Initial composite results from Dulcie Far North combined with those from previous scout drilling by Zenith and historic exploration drill holes on lines 100m to 200m apart, outline an additional 1km long x 300m wide gold mineralised corridor, new results include (refer Table 1):

- 3m @ 70.0 g/t Au (end of hole)
- 8m @ 2.5 g/t Au
- 8m @ 1.9 g/t Au, and
- 12m @ 1.0 g/t Au incl 4m @ 1.9 g/t Au

**Results compliment previous drill results (refer Table 3), including:** 

- 6m @ 11.1 g/t Au
- 4m @ 8.1 g/t Au
- 5m @ 5.6 g/t Au and
- 5m @ 4.7 g/t Au
- Infill and extensional AC drilling is now required at Dulcie Far North to be followed by RC drilling on these significant near surface gold results and at the adjoining 3 Dulcie targets: Dulcie Laterite Pit, Dulcie North & Water Bore.

**Commenting on the new high-grade gold results from Split Rocks Chairman Peter Bird said:** "The results are great and in addition to the existing 2km long gold zone at Dulcie Laterite Pit, they define another 1km long zone that now requires further follow-up drill testing. We note that these new results from 36 holes are only a portion of the larger 100-hole drill program, they are particularly significant given the relatively coarse spacing of drill lines at Dulcie Far North. High grades to 70 g/t Au at end of hole are more than worthy of follow up. The continuing drill programs at Split Rocks are likely to add significant value to the Company."

#### New Drill Results

A total of 36 AC holes were completed at Dulcie Far North in this recent program, part of a larger 100-hole AC program. The holes along with previous Zenith AC and historic drilling on lines 100m to 200m apart outline a zone of gold mineralisation 1km long x 300m wide. Results from hole ZDAC339 are particularly significant returning **3m @ 70 g/t Au** from 44m depth to the end of the drill hole which terminated in a zone of intense quartz veining close to a basalt – banded iron formation contact.

Note Zenith retains gold rights at Dulcie Far North below 6m, subject to the Dulcie option agreement (refer to ASX Release 21-Mar-19).

#### Split Rocks Project - Background on Gold Potential

A major targeting exercise by the Company's geological team initially identified 12 high-quality gold drill targets at Split Rocks, subsequently expanded to 18 targets in the north-eastern sector of the Company's 100% owned tenure (Refer to ZNC ASX Release 2 September 2020).

Drilling to date has tested 12 targets (results awaited for Dulcie West) with outstanding first pass results returned at (ASX Release 5-Aug-20, 2-Sep-20, 19-Oct-20, 28-Oct-20, 15-Ja-21, 11-Mar-21, 21-Apr-21):

- o <u>Dulcie North</u>: 32m @ 9.4 g/t Au, incl 9m @ 31.4 g/t Au
- o Dulcie Laterite Pit:
  - 2m @ 14.5 g/t Au, incl. 1m @ 20.8 g/t Au,
  - 18m @ 2.0 g/t Au (EOH) incl. 1m @ 23.7 g/t Au
  - 14m @ 3.5 g/t Au
  - 3m @ 17.9 g/t Au
- Estrela Prospect: 2m @ 9.8 g/t Au
- o Dulcie Far North: 5m @ 5.6 g/t Au incl. 4m @ 6.8 g/t Au
- Water Bore: 3m @ 6.6 g/t Au

A further 7 of the 18 targets generated by Zenith extending over 18km of strike are yet to have first pass drill testing.

Infill and extensional aircore drilling is now required at Dulcie Far North to be followed by RC drilling on the significant near surface gold results at the 4 Dulcie targets, Dulcie Laterite Pit, Dulcie North, Dulcie Far North & Water Bore. are planned.

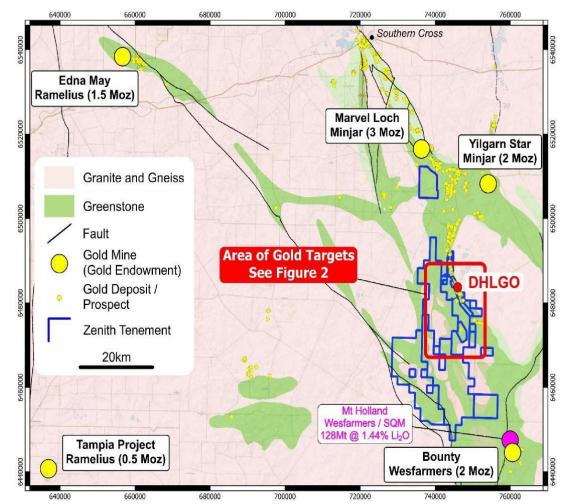

Figure 1- Split Rocks Project Location Map Showing Zenith tenements, Dulcie Heap Leach Gold Operation (DHLGO\*) Prospect and Regional Gold Endowment. (\*Gold rights below 6m subject to option agreement).

#### Authorised for release by the Zenith Minerals Limited Board of Directors – 24<sup>th</sup> June 2021

For further information contact Zenith Minerals Limited:

Directors Michael Clifford or Peter Bird E: mick@zenithminerals.com.au / peter@zenithminerals.com.au Phone +61 8 9226 1110

#### **Competent Persons Statement**

The information in this report that relates to Exploration Results is based on information compiled by Mr Michael Clifford, who is a Member of the Australian Institute of Geoscientists and an employee of Zenith Minerals Limited. Mr Clifford has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Clifford consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

#### Material ASX Releases Previously Released

The Company has released all material information that relates to Exploration Results, Mineral Resources and Reserves, Economic Studies and Production for the Company's Projects on a continuous basis to the ASX and in compliance with JORC 2012. The Company confirms that it is not aware of any new information that materially affects the content of this ASX release and that the material assumptions and technical parameters remain unchanged.

#### About Zenith

Zenith has a vision to build a gold and base metals business with a team of proven project finders. Focus is on 100% owned Zenith projects, whilst partners progress multiple additional opportunities using third party funds.

Zenith is continuing to focus on its core Australian gold and copper projects including:

**Red Mountain Gold Project** in Queensland (100% owned) where ongoing drilling is following-up the highgrade near surface gold and silver intersected in the maiden & subsequent drill programs (ASX Releases 3-Aug-20 & 13-Oct-20, 9-Nov-20, 21-Jan-21), including:

- 13m @ 8.0 g/t Au & 3.2 g/t Ag from surface
- 15m @ 3.5 g/t Au, incl. 2m @ 22.4 g/t Au
- 5m @ 10.4 g/t Au, and
- o 12m @ 4.9 g/t Au

**Split Rocks Gold Project** in Western Australia (100% owned), where recent drilling returned, high-grade near surface gold mineralisation at multiple targets (ASX Release 5-Aug-20, 2-Sep-20, 19-Oct-20, 28-Oct-20, 15-Ja-21, 11-Mar-21, 21-Apr-21), including:

- o <u>Dulcie North</u>: 32m @ 9.4 g/t Au, incl 9m @ 31.4 g/t Au.
- o Dulcie Laterite Pit:
  - 2m @ 14.5 g/t Au, incl. 1m @ 20.8 g/t Au,
  - 18m @ 2.0 g/t Au (EOH) incl. 1m @ 23.7 g/t Au &
  - 14m @ 3.5 g/t Au
- Estrela Prospect: 2m @ 9.8 g/t Au (open to north & south)
- Dulcie Far North: 5m @ 5.6 g/t Au incl. 4m @ 6.8 g/t Au
- <u>Water Bore</u>: 3m @ 6.6 g/t Au
- Develin Creek Copper-Zinc Project in Queensland (100% owned) maiden drill test of the new Snook copper target located 30km south of Zenith's JORC resources discovers massive copper-zinc sulphides (ASX Release 17-Dec-20).

- Jackadgery Gold Project in New South Wales (option to earn initial 90%), historic trenching returned 160m @ 1.2 g/t Au. No drilling to date. Zenith planning maiden drill test (ASX Release 10-Sep-20).
- Earaheedy Zinc Project in Western Australia (25% free carry to end BFS). New major zinc discovery to be fast tracked with extensive accelerated exploration program underpinned by a recent \$40M capital raising by partner Rumble Resources Limited (ASX:RTR) (ASX Releases 28-Apr-21 & 2-Jun-21).

### JORC Tables Section 1 Sampling Techniques and Data for Zenith Aircore Drilling

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.	4m composite aircore drill samples were collected at depths ranging from 0 to 56m depth. Samples were collected via a cyclone.
Sampling	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	Samples are representative of the intervals sampled.
techniques	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	Aircore drilling was used to obtain 4 m composite from which 2 kg was pulverised with analysis for gold by 50g fire assay with AAS finish
Drilling techniques	Drill type (e.g. core, reverse circulation, open- hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc.).	Aircore
	Method of recording and assessing core and chip sample recoveries and results assessed.	Samples were visually assessed in the field and using an estimated bulk density compared against theoretical mass to estimate recovery.
Drill sample recovery		Aircore ensured good recoveries through-out the drill program, holes that ended in high-water ingress were terminated to ensure adequate sample recovery.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Acceptable overall sample recoveries through-out drill program no bias likely.

	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	All drill samples were logged by a qualified geologist
Logging	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.	
	The total length and percentage of the relevant intersections logged.	100%
	If core, whether cut or sawn and whether quarter, half or all core taken.	No core
Sub-sampling	If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.	Cone splitter for each 4m composite sample.
techniques and sample preparation	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	Samples were analysed at Nagrom Laboratories in Perth, 2 kg was pulverised and a representative subsample was analysed for gold by 50g fire assay with AAS finish.
	Quality control procedures adopted for all sub- sampling stages to maximise representivity of samples.	~200g of sample was pulverised and a sub-sample was taken in the laboratory and analysed.
Sub-sampling techniques and sample	•	Duplicate samples were taken in the field and analysed as part of the QA/QC process
preparation - continued	Whether sample sizes are appropriate to the grain size of the material being sampled.	Each sample was approximately 2kg in weight which is appropriate to test for the grain size of material sampled.
	assaying and laboratory procedures used and	Samples were analysed at Nagrom Laboratories in Perth, 2 kg was pulverised and a representative subsample was analysed for gold by 50g fire assay with AAS finish.
Quality of assay data and laboratory tests	For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	No geophysical tools used in this program.
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	Blanks, certified reference material for gold, and duplicate samples were included in the analytical batches and indicate acceptable levels of accuracy and precision.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	At least 2 Zenith company personnel have been to the prospect area and observed samples and representative drill chip samples
loodynig	The use of twinned holes.	Nil

		Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Field data were all recorded on paper logs and sample record books and then entered into a database
Ľ		Discuss any adjustment to assay data.	No adjustments were made.
2	Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Sample location is based on GPS coordinates +/-5m accuracy.
	$\bigcirc$	Specification of the grid system used.	The grid system used to compile data was MGA94 Zone 50
(	Location of data points – continued	Quality and adequacy of topographic control.	Topography control is +/- 10m.
		Data spacing for reporting of Exploration Results.	Refer to Figures 2 - 7
	Data spacing and distribution	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	There is insufficient information to calculate a mineral resource
		Whether sample compositing has been applied.	Simple weight average mathematical compositing applied
	Orientation of data in relation to	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	All Zenith drilling is -60 degrees east and is close to representing true width thickness of the west dipping gold mineralisation, based on the current geological interpretation. Further drilling is required to confirm this interpretation.
ge	geological structure	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	
2	Sample security	The measures taken to ensure sample security.	All samples were taken by Zenith personnel on site and retained in a secure location until delivered directly to the laboratory by Zenith personnel.
	Audits or reviews	The results of any audits or reviews of sampling techniques and data.	The sampling techniques and data have been reviewed by two company personnel who are qualified as Competent Persons

# Section 1 Sampling Techniques and Data – Historic Drill Holes

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
		Historical drill holes:
		CUR* RAB holes were drilled by Thames Mining NL in 1985 & 1986. Samples were collected as 3m composites (WAMEX Open file reports a18004 & 19521).
CD		CURC* RC holes were drilled by Thames Mining NL in 1986. Samples were collected as 2m composites (WAMEX Open file report a19554). PR-* RAB holes were drilled by Gwalia Minerals NL in 1988. Samples were collected as 3m composites with some later re- sampling at 1m (WAMEX Open file report a37134).
		dac* aircore holes were drilled by Aztec Mining Ltd in 1992. Samples were collected as 5m composites (WAMEX Open file report a37803).
		P7SRC* RC holes were drilled by Gasgoyne Gold Mines in 1995-96. Samples were collected as 2m composites with some later re-sampling at 1m (WAMEX Open file report a49187).
Sampling techniques	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples about and her by taken an limiting the broad	DHRC* RC holes were drilled by Sons of Gwalia Ltd in 1996. Samples were collected as 4m composites with some later re-sampling at 1m (WAMEX Open file report a52864). PSA* aircore holes were drilled by Sons of Gwalia Ltd in 1996-97. Samples were collected as 4m composites with some later re-sampling at 1m (WAMEX Open file report a53374).
	should not be taken as limiting the broad meaning of sampling.	PDR* & PSR* RAB and PDA* aircore holes were drilled by Sons of Gwalia Ltd in 1998. Samples were collected as 3m composites with some later re-sampling at 1m (WAMEX Open file reports a58137 & a62999).
		LDRC* RC holes were drilled by Crusader Holdings NL in 2004. Samples were collected as 4m composites with some later re-sampling at 1m (WAMEX Open file report a68752).
		DLRC* RC holes were drilled by Southern Cross Goldfields Ltd in 2009-2010. Samples were collected as 4m composites with some later re-sampling at 1m (WAMEX Open file reports a85232 & a88742).
		DRC* RC holes were drilled by Sons of Gwalia Ltd in 1998 (a62999). Three metre composite samples were collected from each hole and submitted to Ultra Trace Laboratories in Perth for analysis.
		DR* RAB holes were drilled by Kia Ora Gold Corporation NL in 1986. Samples were speared as 4m composites (a20282)

		<ul> <li>dl* RAB holes were drilled by Aztec Mining Company Limited in 1992. Samples were collected as 5m composite with some re-sampling at 1m (a37803).</li> <li>DLP* RC holes were drilled by Aztec Mining Company Limited in 1992 and 1993. Samples were collected as 3m composites (a56455).</li> <li>Zenith drilling is progressively validating previous drill results by follow-up drill programs.</li> </ul>
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	Historical samples are considered to be representative of the intervals sampled. Industry standard practice is assumed.
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	Historical drilling: Historical RAB and RC drilling were used to obtain 1 to 5m composite samples which were analysed for gold following diverse methods (see below).
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc.).	Historical drilling: RAB, aircore and RC
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	Drill chip recoveries are not documented in historical reports. Appropriate controls will be put in place in future infill drilling programmes. With the exception of some RC drill holes completed by Crusader Resources that had some wet samples that were reported as having poor recoveries (a68752) it is assumed that most samples have been drilled dry and that acceptable recoveries have been achieved.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	Not documented in historical drilling.

	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Not documented in historical drilling.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Historical drill samples were logged by qualified geologists.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.	Historical logging was qualitative.
$\mathbb{Q}$	The total length and percentage of the relevant intersections logged.	All historical intersections were logged.
(D)	If core, whether cut or sawn and whether quarter, half or all core taken.	No core
	If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.	Different methods were used with historical samples. When reported, generally 1m samples from cyclones were riffle split and composited to final sample. Samples were generally dry but some were reported as wet.
Sub-sampling techniques and sample preparation	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	<ul> <li>CUR* RAB samples were analysed at Analabs Laboratories at Welshpool (WA) using Fire Assay followed by AAS determination.</li> <li>CURC* assaying methods and laboratory were not reported. PR-* samples were analysed at Kal Assays Southern Cross Pty Ltd in Southern Cross (WA) using aqua regia digestion followed by AAS determination. Re-sampling assayed via Fire assay.</li> <li>dac* samples were analysed at ALS laboratory in Perth (WA) using aqua regia (50g) digestion followed by AAS determination.</li> <li>P7SRC* samples were analysed at Yilgarn Assay Laboratory in Southern Cross (WA) using aqua regia (AR50) digestion followed by an unreported determination method.</li> <li>DHRC* assaying methods and laboratory were not reported.</li> <li>PSA* samples were analysed at ALS laboratory in Perth (WA) using aqua regia digestion followed by an unreported determination method. Re-sampling assayed via Fire assay.</li> <li>PDR*, PSR* &amp; PDA* samples were analysed at Ultra Trace Laboratories in Perth (WA) using an aqua regia digestion followed by ICP-MS/OES determination. Resampling assayed at ALS laboratory in Perth (WA) using an aqua regia digestion followed by ICP-MS/OES determination.</li> <li>LDRC* samples were analysed at Leonora Laverton Assay Laboratory in Southern Cross (WA) using cyanide leaching (PAL1). Re-sampling assayed via 40g</li> </ul>

			DLRC* samples were analysed at Ultra Trace Perth (WA) using Fire Assay (FA002) followed by ICPOES determination.
			Hole DRC005 was assayed for Au and Ni using an aqua regia digestion followed by ICP-MS determination. Anomalous samples were re-split to 1m intervals and assayed for Au, Pd and Pt by fire assay/ICP-OES.
C			DR* samples were analysed at Kalgoorlie Assay Laboratories (Kalgoorlie) and were assayed by AAS method.
$(\Box$	5)		dl* samples were analysed at Analabs (Perth) using an aqua regia digestion followed by AAS determination.
Ù	Ð		DLP* samples were analysed at Analabs (Perth) using an aqua regia digestion followed by AAS determination.
	$\mathcal{D}$		FDUP* samples were analysed by Fire Assay. No other information is available.
			P7A* assay method was not documented.
A	5	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	Standard industry laboratory procedures are assumed to have been in place following pulverising of the sample material (80% passing 75um).
	Sub-sampling techniques and sample preparation -	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	Historical drilling: Field duplicate or second half sampling is generally not stated in historical reports; selected repeat samples from the PDR* & PDA* series were sent to ALS Laboratories in Perth and assayed for gold using an aqua regia digestion followed by graphite furnace / AAS determination (a62999).
	continued	Whether sample sizes are appropriate to the grain size of the material being sampled.	Historical Drilling: Sample sizes are assumed to be following industry standards and appropriate.
			CUR* RAB samples were analysed at Analabs Laboratories at Welshpool (WA) using Fire Assay followed by AAS determination.
Ć			CURC* assaying methods and laboratory were not reported.
	Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the	PR-* samples were analysed at Kal Assays Southern Cross Pty Ltd in Southern Cross (WA) using aqua regia digestion followed by AAS determination. Re-sampling assayed via Fire assay.
		technique is considered partial or total.	dac* samples were analysed at ALS laboratory in Perth (WA) using aqua regia (50g) digestion followed by AAS determination.
			P7SRC* samples were analysed at Yilgarn Assay Laboratory in Southern Cross (WA) using aqua regia (AR50) digestion followed by an unreported determination method.

		DHRC* assaying methods and laboratory were not reported.
		PSA* samples were analysed at ALS laboratory in Perth (WA) using aqua regia digestion followed by an unknown determination method. Re-sampling assayed via Fire assay.
		PDR*, PSR* & PDA* samples were analysed at Ultra Trace Laboratories in Perth (WA) using an aqua regia digestion followed by ICP-MS/OES determination. Re- sampling assayed at ALS laboratory in Perth (WA) via aqua regia followed by graphite furnace/AAS determination.
0		LDRC* samples were analysed at Leonora Laverton Assay Laboratory in Southern Cross (WA) using cyanide leaching (PAL1). Re-sampling assayed via 40g Fire assay. DLRC* samples were analysed at Ultra Trace Perth (WA) using Fire assay.
		Hole DRC005 was assayed for Au and Ni using an aqua regia digestion followed by ICP-MS determination. Anomalous samples were re-split to 1m intervals and assayed for Au, Pd and Pt by fire assay/ICP-OES.
		DR* samples were analysed at Kalgoorlie Assay Laboratories (Kalgoorlie) and were assayed by AAS method.
$\overline{\mathbf{D}}$		dl* samples were analysed at Analabs using an aqua regia digestion followed by AAS determination.
Ð		DLP* samples were analysed at Analabs (Perth) using an aqua regia digestion followed by AAS determination.
5		FDUP* samples were analysed by Fire Assay. No other information is available.
		P7A* assay method was not documented.
	For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	No geophysical tools used in this drilling program
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of	Historical drilling: The QA/QC controls are not well documented in historical reports. selected repeat samples from the PDR*, PSR* & PSA* series were sent to ALS Laboratories in Perth and assayed for gold using an aqua regia digestion followed by graphite furnace / AAS determination (a62999).
	accuracy (i.e. lack of bias) and precision have been established.	Thirteen successive drilling campaigns by seven different companies analysed by at least six separate laboratories have confirmed the presence of bedrock gold mineralisation and provide comfort that significant bedrock gold mineralisation exists.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	Historical drilling: Thirteen successive drilling campaigns by seven different companies analysed by at least six separate

		laboratories have confirmed the presence of bedrock gold mineralisation.
	The use of twinned holes.	No specific twin hole drilled but thirteen successive drilling campaigns by seven different companies analysed by at least six separate laboratories have confirmed the presence of bedrock gold mineralisation.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Historical drilling: Field data were recorded on paper logs.
	Discuss any adjustment to assay data.	No adjustments were made.
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Historical drilling: Original drill collar locations based on compass and tape surveys or GPS depending on year of drilling. Selected drill hole collar locations have been verified in the field using GPS with +/- 3m accuracy. Some more recent drilling surveyed using a carrier-phase enhancement GPS (a85232).
	Specification of the grid system used.	The grid system used to compile data was MGA94 Zone 50
Location of data points - continued	Quality and adequacy of topographic control.	Topography control is +/- 5m
	Data spacing for reporting of Exploration Results.	Drill holes shown in Figures 3 & 4 and Tables 3 & 4
Data spacing and distribution	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	The data alone will not be used to estimate mineral resource or ore reserve.
	Whether sample compositing has been applied.	Different methods were used with historical samples. When reported, generally 1m samples from cyclones were riffle split and composited to final sample. Samples were generally dry but some were reported as wet.
Orientation of	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	The intersections in all drill holes are interpreted to be close to true widths.
data in relation to geological structure	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	As above
Sample security	The measures taken to ensure sample security.	Historical drilling: Industry standards are inferred to have been used.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	Historical drilling: No specific audit documented but at least four successive drilling campaigns by different companies analysed by at least two separate laboratories have confirmed the presence of bedrock gold mineralisation.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	operating Dulcie Heap Leach Gold Project (DHLGO) in
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Refer to ASX release 21 <sup>st</sup> March 2019.
Geology	Deposit type, geological setting and style of mineralisation.	Archean mesothermal lode gold mineralisation hosted within banded iron formation (BIF) and mafic rock types.
Drill hole Information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: o easting and northing of the drill hole collar	Refer to Figures and Tables in body of text of this ASX release.
	o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar	
	o dip and azimuth of the hole	
	o down hole length and interception depth	
	o hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high	High-grade intersections are length weighted average grades with minimum cut -off grade of 1.0g/t Au and no internal dilution, whilst lower grade intersections are length weighted average grades with minimum cut-off grade of 0.4g/t Au and maximum internal dilution of 4m.
	Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	

Data aggregation methods - continued	The assumptions used for any reporting of metal equivalent values should be clearly stated.	
Relationship	These relationships are particularly important in the reporting of Exploration Results.	Drilling is angled -60 degrees east or vertical and based on current interpretation is thought to be representing true width thickness of the flat lying supergene or gentle west dipping gold mineralised zones however further drilling is required to confirm this interpretation.
between mineralisation widths and intercept lengths	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	
	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	Mineralised intervals reported are down-hole lengths but
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to Figures and Tables in body of text of this ASX
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Refer to Figures and Tables in body of text of this ASX release.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	No other meaningful or material exploration data to be reported at this stage.
	The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).	
Further work	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Refer to figures in body of this report.
