ASX:PKO

East Kimberley Exploration Update

Highlights

- **Aircore drilling program completed with 473 holes for 3014m drilled across 10 targets in 7 areas. Assays currently pending.**
- **New rock chip assay results confirm gold mineralisation within quartz veins at Appaloosa and Gypsy with results up to 12.7 g/t Au at Appaloosa and 1.1 g/t Au at Gypsy.**
- **Mapping of the Appaloosa vein system has defined an area with a series of gossanous mineralised veins for RC drill testing.**
- **RC drilling to commence in August to test a number of areas with favourable geology and rock chip results as well as drill testing three historical prospects for gold.**

Peako Limited (ASX: PKO, Peako) is pleased to provide an update on its 2021 East Kimberley field season activities including the completion of aircore drilling, encouraging rock chip results and its planned upcoming scout RC drilling program (Figure 1).

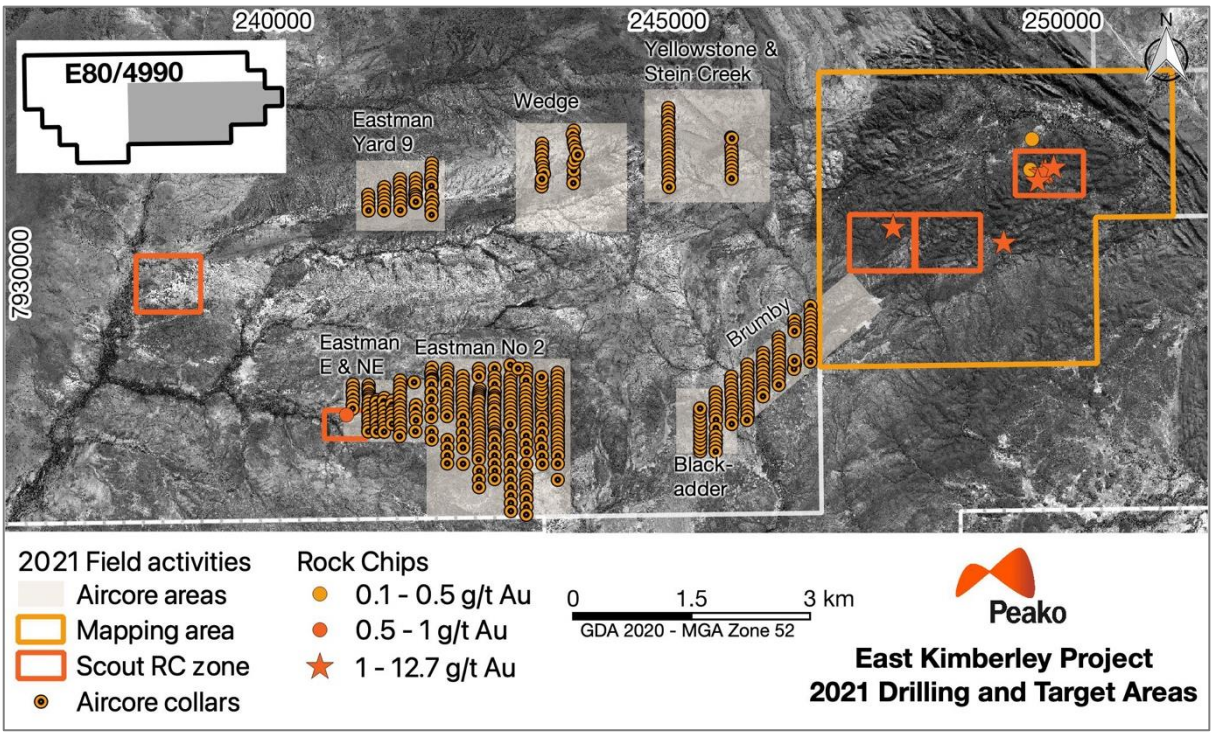

Figure 1 Summary of Peako's 2021 Field Season Activities

Aircore Geochemistry Program

Peako has completed its aircore geochemistry program on the E80/4990 Eastman tenement. A total of 473 aircore holes were completed, testing ten targets across seven priority areas (refer Figure 1 and Table 1). Aircore meterage totalled 3014m, which was lower than anticipated due to shallow cover and more extensive subcrop than previously recognised.

Peako's aircore program was designed to test for geochemical anomalies in 10 targets across 7 separate areas that were defined from an array of prospective geological features including anomalous base metal and gold geochemistry (soil, rock, drilling), geophysics (VTEM, magnetics), prospective structure, as well as encouraging satellite imagery spectral indicators. Mineralisation styles tested by aircore geochemistry vary between the target areas from structural to intrusion-related gold-copper targets to extensions of ultramafic rocks below cover sequences with potential for Cu-Ni-PGE mineralisation. In addition, a number of areas tested by our 2021 aircore program were designed to confirm and/or extend target areas where historical soil geochemistry programs had previously identified base metal anomalism but where previous explorers did not analyse for gold.

All aircore drill holes were sampled below transported cover in 1m, 2m or 4m composites and samples have been submitted to Intertek Genalysis in Perth for gold and multielement analysis. Aircore assay results are anticipated progressively over the coming months due to slow laboratory turnaround times. Geochemical results from aircore are aimed to define anomalous gold, base metal and/or PGE targets that, once integrated with completed field mapping, will define robust targets for subsequent RC drill testing. Testing of any aircore geochemistry-geological targets is likely to be incorporated into next year's field season, given laboratory turnaround and impending wet season onset by late September/October.

Mapping and Rock Chip Sampling Assay Results

Mapping and rock chip sampling across areas including Appaloosa, Gypsy and the historical Eastman and Landrigan prospects has been completed. This follow up of scattered historical gold assay results was directed to evaluate a widely identified but overlooked latent gold potential recorded in historical exploration data across the tenement.

Assay results from 92 rock chip samples collected during field mapping have been received (refer Table 2). Results are highly encouraging and continue to support the presence of multiple outcropping gold-bearing quartz vein systems at the Appaloosa, Gypsy and Eastman prospects as well as at a new vein system approximately 400m to the east of Louisa area that Peako has named "Shire (refer Figure 2).

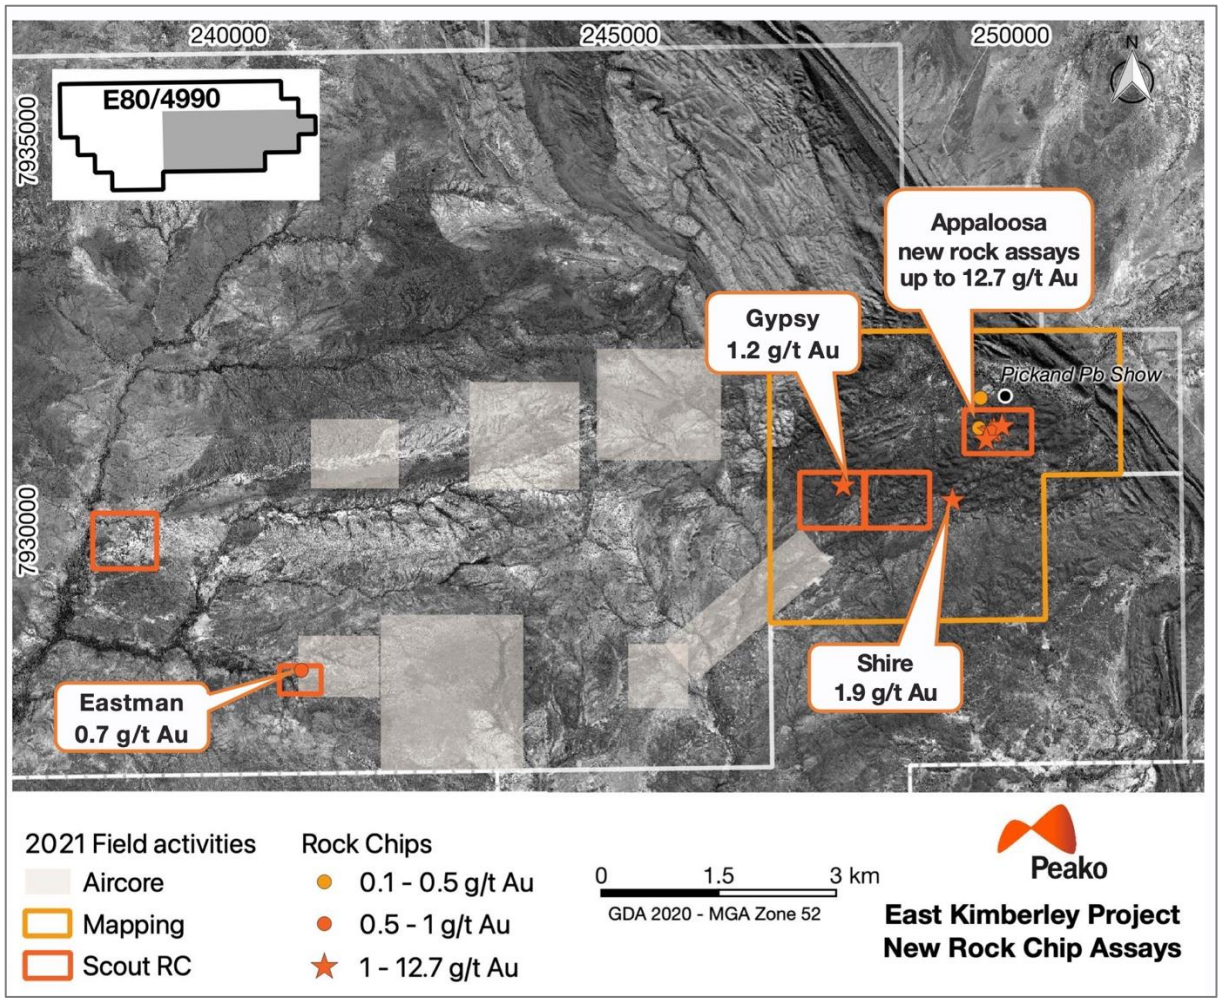

Figure 2 Location of new rock chip samples

At Appaloosa, multiple gossanous veins were observed to have gold grades varying from 1.3 g/t Au to 12.7 g/t Au. At Gypsy and Shire gossanous quartz veins returned gold grades of 1.14 g/t Au and 1.94 g/t Au respectively. Limited multi-element data from Appaloosa and Gypsy rock chips identify the two vein systems as having different pathfinder trace element association. Appaloosa has an Au-As-Pb signature with As levels up to 9921 ppm and Pb up to 11.0%, whilst Gypsy has an Au-Bi-Cu-Mo signature with Bi up to 147 ppb, Cu up to 5062 ppm and Mo up to 17 ppm (Table 2). These different trace element signatures could support different styles of gold mineralisation in different locations on the tenement.

In addition, a massive galena sample from old workings at the historical 'Pickands Pb Show' 170 m due north of the Appaloosa prospect returned >40% Pb and 138 ppm Ag.

Appaloosa Mapping

A campaign of detailed mapping at 1:2500 scale was completed at Appaloosa (refer Figure 3) in conjunction with 1:10000 scale interpretation of the easternmost parts of the E80/4990 tenement. The resulting maps define a structurally complex mafic-ultramafic host rock sequence with multistage intrusions as a broad host rock framework for potential mineralisation.

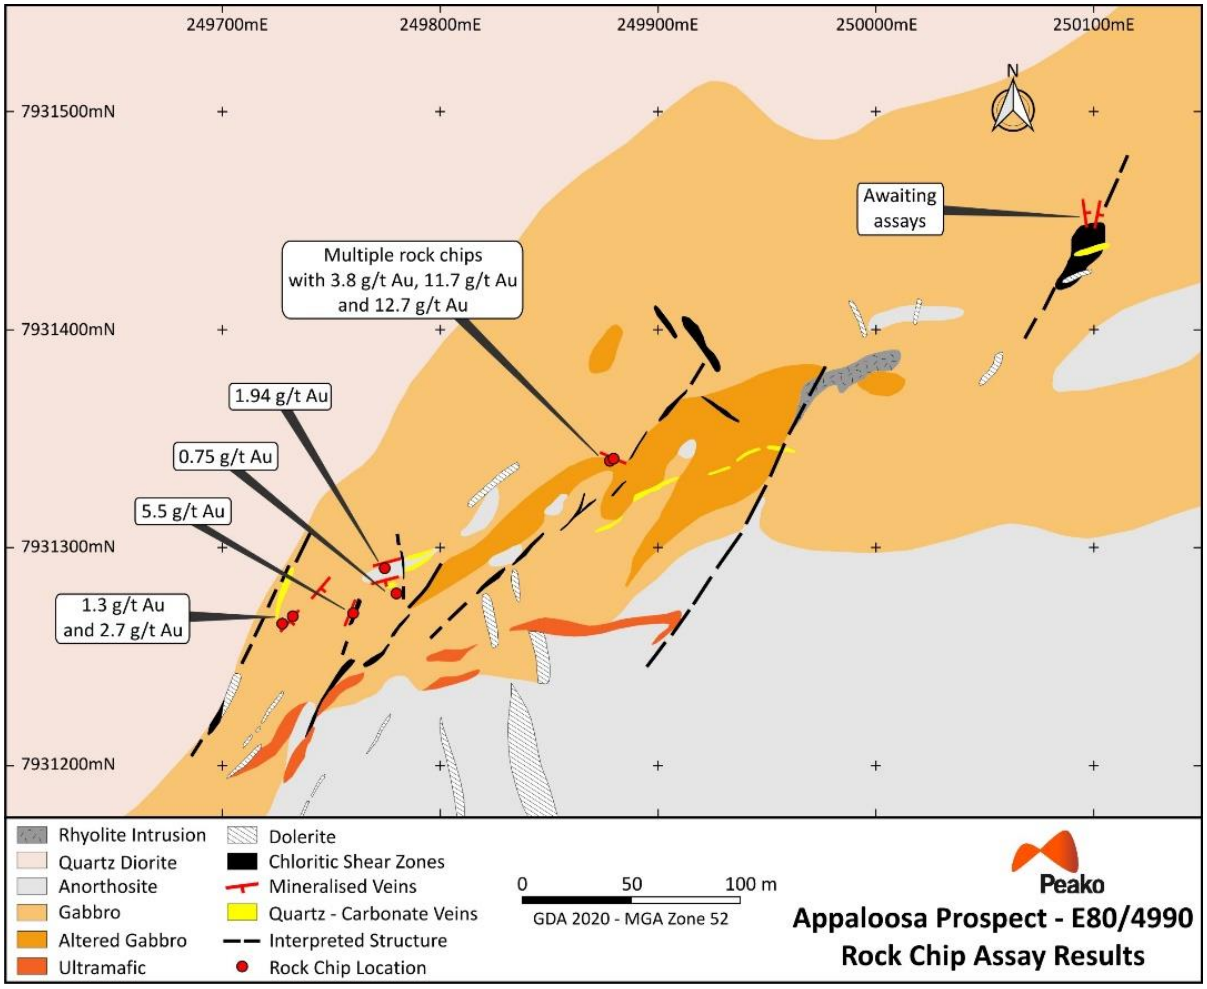

Figure 3 Geological map of the Appaloosa area and location of quartz-carbonate and gossanous veins that contain Au grades from 0.39 to 12.7 g/t Au

At Appaloosa, outcropping mineralised gossanous quartz veins were mapped over an approximate 400m strike in an area known to have historical Au grades in veins up to 11.7 g/t Au. Importantly, Peako's recent rock chip results not only confirm the present of high grade gold veins but also demonstrate the occurrence of multiple to stacked outcropping mineralised gossanous veins. Rock chip results from Appaloosa currently define the vein to outcrop over a 200m strike with veins having gold grades that vary from 0.39 g/t Au up to **12.7g/t Au**. Assay results from gossanous veins in the northeast of Appaloosa are still pending.

Outcropping mineralised veins at Appaloosa occur as narrow (up to 20cm) discontinuous veins within propylitic epidote altered massive gabbro. The veins can be continuous in strike over 15m, but are mostly poorly exposed. Mineralised veins typically strike north to northeast strike with an east to southeast dip between 45° to 70°. Mineralised Fe-oxide veins have grey quartz intermixed with goethitic boxwork likely after the pyrite, arsenopyrite and galena. Examples of the mineralised Appaloosa veins are shown in Figure 4

Mineralised veins are hosted in propylitic altered gabbro proximal to NE-trending chloritic shear zones. The current geological configuration along with assay results potentially indicate a NE-trending mineralised corridor of some 200-400m. Scout RC drill testing of this area is planned for August 2021.

Figure 4 Examples of outcropping gossanous quartz veins at Appaloosa grades sampled by P2100242 with a grade of 1.3 g/t Au (left) and P2100243 with a grade of 2.73 g/t Au (right).

'Scout' RC drill program

A 'scout' RC drill program is planned to commence in August to test a number of new and historical targets for gold. The scout RC program will use our contract driller with their track-mounted Hydropower Scout Mark II rig which is already on site having completed the aircore drilling program.

The multipurpose rig is being reconfigured for RC drilling and will expedite our early-stage scout drill testing of a number of 'hard rock' targets. These targets have been developed from the combination of recent geological mapping, rock assay results and our library of historical drill and geochemistry data where available.

Targets and drillholes are currently being finalised with the objective of drilling short (60-80m) RC holes for a total of 1000-1200 metres across five targets (Figure 5). Planned areas for drill testing include the Appaloosa and Gypsy vein systems as well as the historical Eastman, Landrigan and Louisa targets where potential for gold-bearing vein systems is untested.

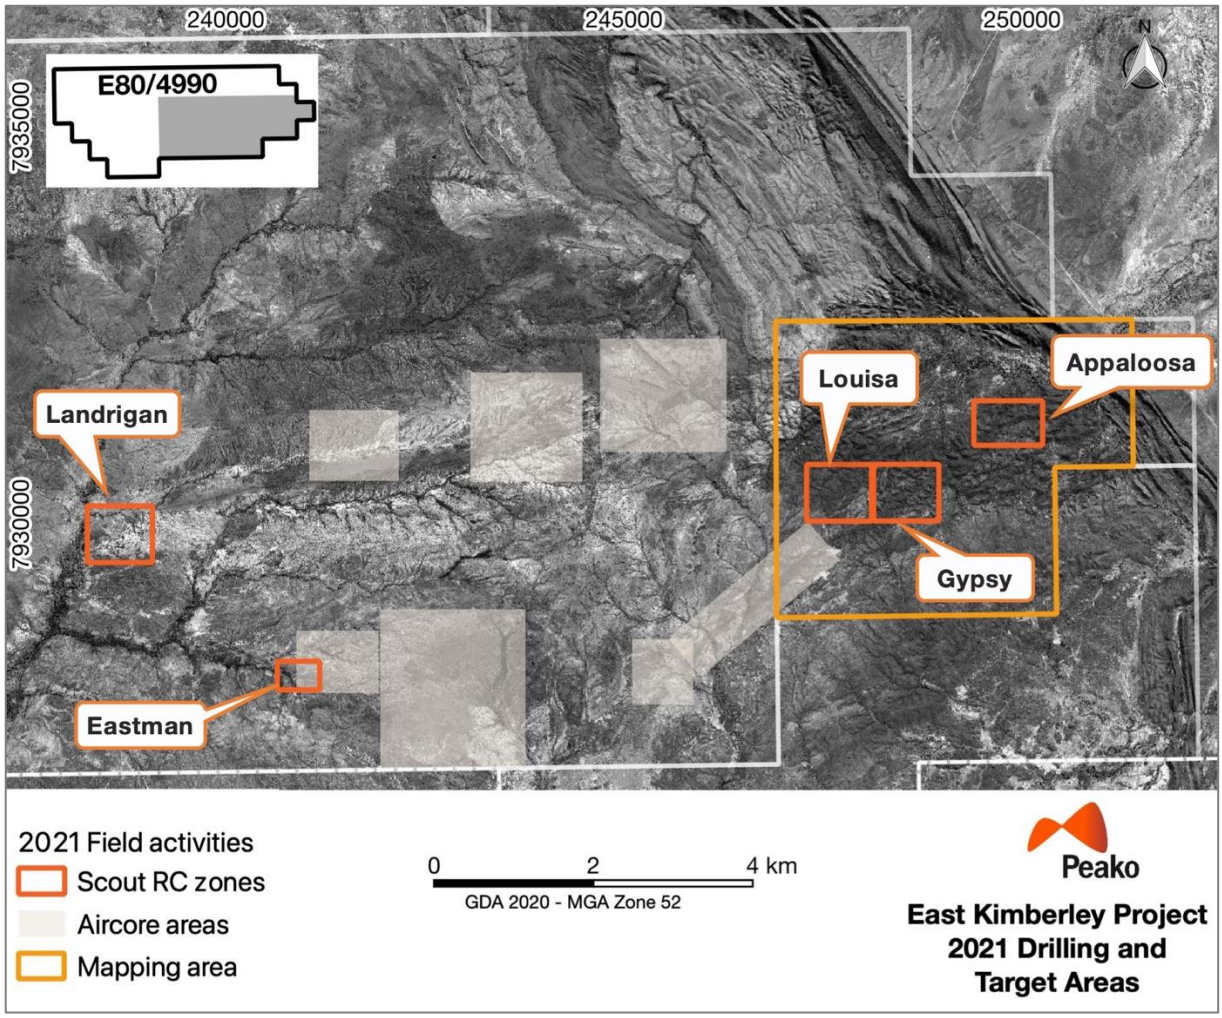

Figure 5 Potential Scout RC locations

EIS Funding

Peako's 2021 aircore and RC drilling activities are supported by two Western Australian Government Exploration Incentive Scheme (EIS) co-funded drilling grants totalling up to $320,000.

Director Comment

Executive Director, Ms Rae Clark, commented "*Our field season strategy is to evaluate a widely identified but often overlooked latent gold potential recorded in historical exploration data. We are pleased to have completed the aircore program and look forward to the second step in our multi-phase drilling campaign that will test a pipeline of targets with encouraging assay results.*"

Competent Person Declaration

The information in this report that relates to Exploration Results is based on information compiled or reviewed by Ms Carolyn Higgins who is a Member of the Australasian Institute of Mining and Metallurgy (AusIMM). Ms Higgins is consultant to Peako Limited and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Ms Higgins consents to the inclusion in this report of the matters based on information provided by her and in the form and context in which it appears.

- Projection: GDA 2020 MGA Zone 52.
- Samples were submitted to Intertek Genalysis for preparation and assay.
- Assay method: Aqua Regia 33 element package including gold by method AR25/MS33.

Table 2: Rock chip sample location and assay results:

- Projection: GDA 2020 MGA Zone 52
- Samples with sample numbers from P2100054 to P2100127 were submitted to Intertek Genalysis for preparation and assay.
- Samples with sample numbers from P2100142 to P2100249 were submitted to ALS for preparation and assay.
- Samples P2100054 to P2100127 Fire Assay 50g gold (FA50/OE04) and Ore grade 4 acid digest (4AO/OM) for elements Ag, As, Bi, Cu, Mo, P, Pb, S, Zn.
- Sample P2100082 – Lead collection fire assay, 50g, FA50/MS for elements Au, Pt and Pd
- Samples from P2100142 to P2100249 were submitted to ALS for preparation and assay. These samples were analysed for Gold only using Au-AA25 Ore Grade Au 30g Fire Assay AA finish.
- < represents an assay below the lower detection limit for that element. For example: Gold <0.005ppm; Ag <2ppm; As <20ppm; Bi <20ppm; Cu <5ppm, Mo <5ppm; P <0.01%; Pb <20ppm; S <0.01%; Sb <20ppm; Zn <5ppm.
- > represents an assay above the upper detection limit for that element. For example: Pb >400000ppm.

Appendix 1: JORC Code (2012 Edition), Assessment and Reporting Criteria

Section 1: Sampling Techniques and Data

Criteria	JORC Code Explanation	Explanation
Sampling Techniques	*Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.*	The sampling described in this report refers to rock chip sampling and aircore (AC) drilling. All samples were collected by qualified geologists or under geological supervision. <u>AC Drilling</u> The AC samples are judged to be representative of the rock being drilled. The nature and quality of all sampling is carried out under QAQC procedures as per industry standards. <u>Rock chip sampling</u> Rock chip samples are random (grab) samples comprised of fragments of rock outcrop (and veins in varying orientations), sampled with a hammer. Rock chip sampling was carried out as part of a geological mapping exercise in areas of geological interest. Sample size is nominally 0.5 to 1 kilogram.
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	All sampling is guided by Peako's protocols and Quality Control procedures as per industry standards.
	Aspects of the determination of mineralisation that are Material to the Public Report.	<u>AC Drilling</u> AC samples are collected by downhole sampling hammers with nominal 127 to 140mm holes. Samples for every metre were collected by the drill offsider from the drill rig cyclone directly into a bucket that was then placed on the ground. A representative sample was collected using a scoop and sampling through and across the sample pile and then placed in pre-labelled calico bags. Samples were no more than 3kg. The AC samples were composited in 1m, 2m or 4m composite intervals. Compositing was based on geological boundaries. A total of 839 AC samples have been submitted to Intertek Genalysis Laboratory in Perth for analysis for Aqua Regia 33 element package including Gold by AR25/MS33 method <u>Rock chip sampling</u> A total 92 rock chip samples were collected. 72 samples were dispatched for analysis to Intertek Genalysis Laboratory in Perth with analysis for FA50/MS and FA50/OE04 20 samples were dispatched for analysis to ALS Laboratory in Burnie with analysis for Au-AA25 Ore Grade Au 30g Fire Assay AA finish.

Criteria	JORC Code Explanation	Explanation
Drilling Techniques	*Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).*	A total of 473 AC holes for 3014m were drilled. The location of each hole was recorded by handheld GPS with positional accuracy of approximately +/- 5m. Location data was collected in GDA 2020, MGA Zone 52. All holes were drilled at 90 degrees.
Drill sample recovery	*Method of recording and assessing core and chip sample recoveries and results assessed.*	AC sample recovery was good. Drill samples were collected in 1m intervals.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	Drill samples are visually checked for recovery, moisture and contamination. A technician is always present at the rig to monitor and record recovery. Recoveries are recorded in the database. There are no significant sample recovery problems.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	No AC assays have been received, so no relationship is seen to exist between sample recovery and grade. No sample bias is due to preferential loss/gain of any fine/coarse material due to the acceptable sample recoveries obtained AC drilling.
Logging	*Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.*	<u>AC Drilling</u> Logging of AC drill chips recorded lithology, mineralogy, mineralisation, weathering, alteration, colour and other features of the samples. The geological logging was done using a standardised logging system. This information and the sampling details were transferred into Peako's drilling database. <u>Rock chip sampling</u> All rock samples were logged into field notebooks along with sample numbers. The rock type, presence of sulphides (or their weathering products) and the presence or absence of alteration minerals was recorded at each site. Photographs of samples and sample numbers were taken.
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.	AC and rock chip logging are both qualitative and quantitative, depending on the field being logged.
	The total length and percentage of the relevant intersections logged.	<u>AC Drilling</u> All AC drill holes are logged in full and to the total length of each drill hole. 100% of each relevant intersection is logged in detail. All rock chips are lithologically logged.
Sub-sampling	*If core, whether cut or sawn and whether quarter, half or all core taken.*	No drill core is described in this report.

Criteria	JORC Code Explanation	Explanation
techniques and sample preparation	*If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.*	<u>AC Drilling</u> AC samples were collected at every metre by the drill offsider from the drill rig cyclone directly into a bucket that was then placed on the ground. A representative sample from each metre was collected using a scoop and sampling through and across the sample pile and then placed in pre-labelled calico bags. The majority of the samples were dry. On the rare occasion that wet samples were encountered, they were sampled as normal, and a note was made in the drill log. AC samples were composted to 1m, 2m or 4m intervals based upon geology. <u>Rock chip sampling</u> Rock chip samples were submitted to Interek Genalysis' Perth laboratory and ALS Laboratory Burnie. Both laboratories are ISO9001-certified. The samples were oven dried and crushed to a nominal top-size of 2mm and pulverised to that at least 85% of the material was finer than 75µm. A low-Cr steel mill was used for pulverizing to minimise contamination. No sub-sampling was undertaken. No duplicate sample were taken as these are reconnaissance samples. Each of the rock chip samples weighed approximately 0.5 to 1kg and are considered to be suitable given the nature of the material being sampled.
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	The sample preparation for all samples follows industry best practice.
	Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.	Peako has protocols that cover the sample preparation at the laboratories and the collection and assessment of data to ensure that accurate steps are used in producing representative samples
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	Sampling is carried out in accordance with Peako's protocols as per industry best practice. Field QC procedures involve the use of certified reference material as assay standards and, blanks. The insertion rate of these averaged 1:25 for AC samples.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	The sample sizes are considered appropriate to correctly represent the style of mineralisation, the thickness and consistency of the intersections

Criteria	JORC Code Explanation	Explanation
Quality of assay data and laboratory tests	*The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.*	<u>AC Drilling</u> A total of 839 aircore samples have been submitted to Intertek Genalysis for analysis using Aqua Regia 33 element package including gold by method AR25/MS33. <u>Rock chip sampling</u> Samples were analysed in certified Intertek Genalysis Laboratory in Perth or in the certified ALS Laboratory in Burnie 71 samples submitted to Intertek Genalysis were requested for analysis for Au, Ag, Cu, Pb, Zn, Bi, As, S, Sb, P. Gold was determined by lead collection fire assay in new pots and analysed by ICP-MS (code FA50/MS) 1 sample was submitted for analysis for Au, Pt and Pd using Intertek method FA50/OE04. In which a 50g charge was split for the sample for fire assay with an ICP-OES finish to determine precious metal grades. 20 samples were submitted to ALS Burnie were requested for analysis of Au only. Gold was determined by lead collection fire assay by Au-AA25 Ore Grade Au30g Fire Assay AA finish.
	For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	Samples were logged and preliminary analyse of the geochemistry of the sample was intermittently checked using a pXRF machine in the field.
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	Sample preparation checks for fineness were carried out by the laboratory as part of their internal procedures to ensure the grind size of 90% passing 75 microns. Internal laboratory QAQC checks are reported by the laboratory. Review of the internal laboratory QAQC suggests the laboratory is performing within acceptable limits. For AC samples, Peako inserts one blank or one standard for every 25 samples
Verification of sampling and assaying	*The verification of significant intersections by either independent or alternative company personnel.*	Reported results are compiled and verified by the Company's Senior Geologist and Competent Person
	The use of twinned holes.	No twinned holes are reported in this release.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Primary field data is collected by Peako's geologists on standardised logging sheets. This data is compiled and digitally captured. The compiled digital data is verified and validated by the Company's geologists.

Criteria	JORC Code Explanation	Explanation
	Discuss any adjustment to assay data.	The primary data is kept on file. There were no adjustments to the assay data.
Location of data points	*Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.*	Sample locations were captured by hand-held GPS with a positional accuracy is approximately +/-5 metres. The coordinates of samples and drill holes are shown in the tables in this report.
	Specification of the grid system used.	Location data was collected in GDA2020, MGA Zone 52.
	Quality and adequacy of topographic control.	The RL of the and rock chip samples was not recorded as it is not considered necessary for early reconnaissance work of this nature.
Data spacing and distribution	*Data spacing for reporting of Exploration Results.*	The samples taken were part of a reconnaissance mapping and sampling program. The average surface sample spacing was highly variable but in the order of metres to tens of metres due to the variation of the outcropping veins.
	Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.	AC drilling and rock chip sampling are not being used for Mineral Resource estimation.
	Whether sample compositing has been applied.	<u>AC Drilling</u> Sample composting was done for AC drilling. <u>Rock chip sampling</u> No sample compositing was applied for the rock chip sampling.
Orientation of data in relation to geological structure	*Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.*	<u>AC Drilling</u> AC drilling is a first pass sampling method to determine if there is mineralisation present. No structures have been accurately determined at this stage. <u>Rock chip sampling</u> Rock chip samples were taken from outcropping veins, gossans, and highly altered rocks in order to confirm the spatial location of the mineralisation.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	No orientation-based sampling bias has been identified in the data at this point.
Sample security	*The measures taken to ensure sample security.*	Samples are stored on site prior to road transport by Company personnel to Broome and then freighted to the laboratory in Perth.

Criteria	JORC Code Explanation	Explanation
		Samples transported to ALS in Burnie were carried as luggage by Peako's geologist and delivered to ALS laboratory.
Audits or reviews	*The results of any audits or reviews of sampling techniques and data.*	There has been no external audit or review of the Company's techniques or data.

Section 2: Reporting of Exploration Results

Criteria	JORC Code explanation	Explanation
Mineral tenement and land tenure status	*Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.*	Results reported in this announcement are from currently granted Exploration Licence E80/4990, in which Peako's wholly owned subsidiary SA Drilling Pty Ltd has a 100% interest. The tenement is situated within the Gooniyandi Combined #2 Native Title Claim (WC 2000/010) and Determination (WCD2013/003).
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The tenement is current and in good standing with all statutory commitments being met as and when required. There are no known impediments to obtaining a licence to operate pending the normal approvals process.
Exploration done by other parties	*Acknowledgment and appraisal of exploration by other parties.*	Historical exploration within the tenement area has been undertaken by numerous parties, commencing with Pickands Mather in 1967. Refer Peako Limited ASX release dated 15 August 2018, Appendix 3 and 28 November 2019, Appendix C for overview of exploration historically undertaken on the tenement.
Geology	*Deposit type, geological setting and style of mineralisation.*	The E80/4990 tenement hosts a diverse Paleoproterozoic succession that is widely intruded by multiple granitoid phases and deformed by multiple orogenic episodes. The morphology of the mineralisation as well as the structural make up is not well understood. The area represents the western-most window of the Halls Creek Orogen where volcanic successions of the bimodal Koongie Park Formation volcanic belt (c.1845 Ma) and the Lamboo Ultramafic (LUM) intrusive belt (c.1850-1835 Ma) are well developed. Recent satellite imagery and rock geochemistry define an array of multistage, poorly constrained granitoid intrusions across the tenement, with compositions that include granite, granodiorite, diorite, monzogranite and granophyre. The geological diversity within the tenement has driven the search for a wide range of commodities by present and past explorers. The Koongie Park Formation (KPF) has demonstrated prospectivity for base (Cu-Pb-Zn)

Criteria	JORC Code explanation	Explanation
		and precious (Ag, Au) metals with postulated mineralisation styles varying from VHMS to SVAL-hybrid styles, to epithermal and skarnoid mineralisation associated with widespread carbonate facies in the KPF stratigraphy. In addition, mafic to ultramafic intrusions of the Lamboo Ultramafic complex have demonstrated prospectivity for base metal (Ni, Cu) and precious (Au, PGE) metals with potential mineralisation styles varying across magmatic, cumulate to intrusion or orogenic-related gold associated with deep crustal-tapping fertile structures.
Drill hole Information	*A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* • *easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* • *dip and azimuth of the hole* • *down hole length and interception depth* • *hole length.*	<u>AC drilling</u> Location data is provided in Table 1 and the location of holes is shown in Figure 1. <u>Rock chip samples</u> N/A
	If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	There has been no exclusion of information.
Data aggregation methods	*In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.*	<u>AC drilling</u> AC drill samples were composted in 1m, 2m or 4m intervals, based on geology. <u>Rock chip samples</u> N/A
	Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	Not applicable to this document.

Criteria	JORC Code explanation	Explanation
	The assumptions used for any reporting of metal equivalent values should be clearly stated.	Metal equivalent values are not reported in this announcement.
Relationship between mineralisation widths and intercept lengths	*These relationships are particularly important in the reporting of Exploration Results.*	<u>AC drilling</u> The reported AC collars are from exploration drilling that is designed to identify the geology and the presence of any anomalous bedrock mineralisation <u>Rock chip samples</u> Samples were taken from outcropping rocks/veins/gossans in order to confirm the spatial location of the mineralisation.
	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	Not applicable to this document.
	If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	Not applicable to this document.
Diagrams	*Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	<u>AC drilling</u> The coordinates of AC collar locations are presented in Table 1 and shown in Figure 1 <u>Rock chip samples</u> The coordinates of sample locations are presented in Table 2 and shown in Figure 3.
Balanced reporting	*Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	The accompanying document is considered to represent a balanced report. <u>Rock chip samples</u> All rock-chip assay results, regardless of grade, have been reported.
Other substantive exploration data	*Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	pXRF measurements were taken in the field of some AC drill and rock chip samples. pXRF analysis have not been reported to the ASX and are considered qualitative analysis only. There is no other exploration data which is considered material to the results reported in the announcement.
Further work	*The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).*	Peako intends to commence suitable drilling program later in the 2021 field season

Criteria	JORC Code explanation	Explanation
	Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Refer to main body of this report.
