

## First drill hole in Ecuador confirms the discovery of a major gold-copper system with a 784 metre<sup>1</sup> intersection

### Highlights

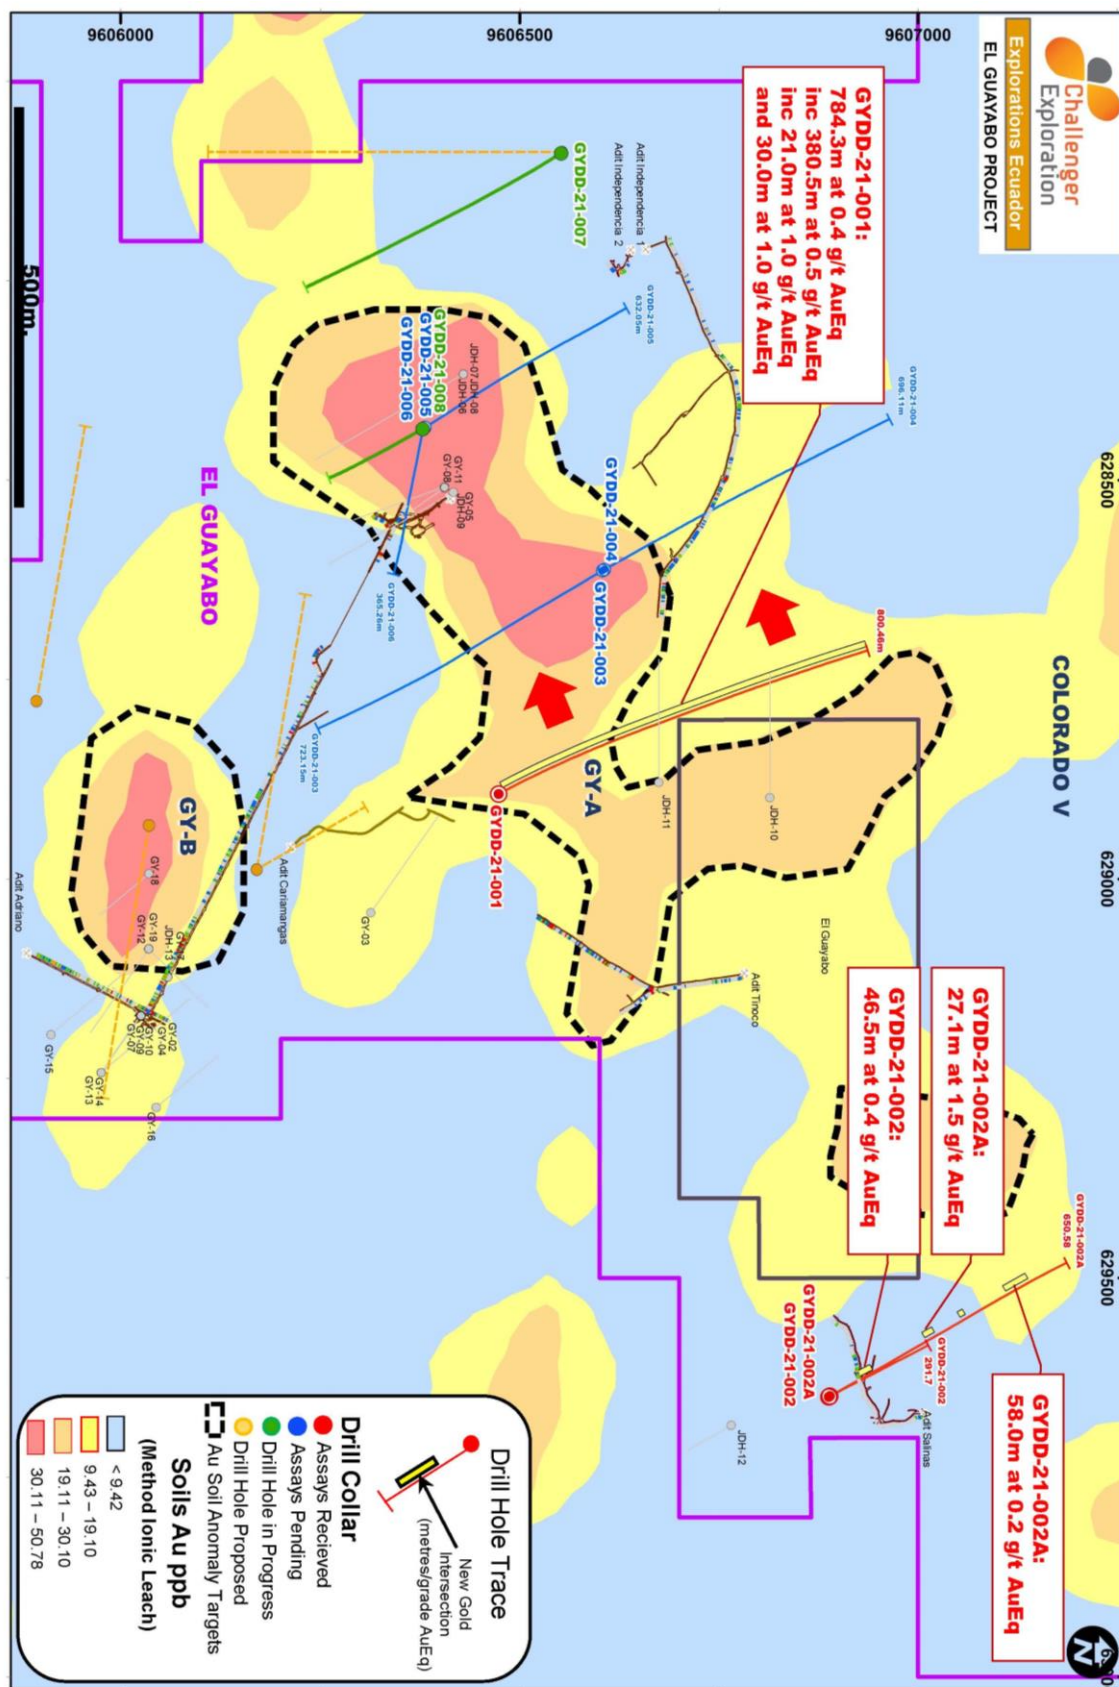

- First drill hole in CEL's 100% owned El Guayabo concession in Ecuador has intersected significant Au-Cu-Ag-Mo mineralisation over 784 metres<sup>1</sup> from 16.2m to the end of the hole at 800.5m
- Significant intersections in drillhole GYDD-21-001 include (Refer Table 1):
  - 784.3m at 0.4 g/t AuEq<sup>2</sup> - 0.2 g/t Au, 1.6 g/t Ag, 0.1 % Cu, 12 ppm Mo from 16.2m including;
  - 380.5m at 0.5 g/t AuEq<sup>2</sup> - 0.3 g/t Au, 2.0 g/t Ag, 0.1 % Cu, 18 ppm Mo from 167.5m including;
  - 188.5m at 0.6 g/t AuEq<sup>2</sup> - 0.4 g/t Au, 2.3 g/t Ag, 0.1 % Cu, 30 ppm Mo from 359.5m including;
  - 21.0m at 1.1 g/t AuEq<sup>2</sup> - 0.8 g/t Au, 3.0 g/t Ag, 0.2 % Cu, 139 ppm Mo from 403.0m and
  - 30.0m at 1.1 g/t AuEq<sup>2</sup> - 0.8 g/t Au, 2.6 g/t Ag, 0.2 % Cu, 25 ppm Mo from 468.5m
- Confirms the strategy for El Guayabo to provide a second gold-copper opportunity of significant scale that is complimentary to CEL's Hualilan Gold Project in Argentina where 9-rigs are drilling
- GYDD-21-001 was a low priority hole, collared significantly east of the main high-grade section of the 1.8km gold in soil anomaly, on the drill pad providing the best access for this first hole
- High priority holes GYDD-21-003 to GYDD-21-006 (assays pending) and GYDD-21-008 (in progress) have been targeted to test the main high-grade section of this anomaly
- A second rig was added at the completion of the third drill hole to expedite the program

Commenting on the results, CEL Managing Director, Mr Kris Knauer, said

*"This result is an outstanding start which confirms we have a major gold-copper system at El Guayabo. The intersection of 784 metres at 0.4 g/t gold equivalent, to the end of the hole, including a higher grade core of 380.5 metres at 0.5 or 188.5 metres at 0.6 g/t gold equivalent is comparable with the results from the Tier 1 Cangrejos gold discovery adjacent to our tenement boundary.*

*The results are even better in the context that these first two holes were drilled on low priority locations. While GYDD-21-001 was drilled to test a 1.8 kilometre gold in soil anomaly, the high-grade core of this anomaly is being targeted in the next four drill holes. Additionally, this is the first of nine geochemical targets within the greater El Guayabo Project with drilling on the highest priority of these targets, located in Colorado V, to start in the current quarter.*

1 - the mineralisation is interpreted as steeply dipping and the true width of the mineralised intercept is estimated at 675 metres.

**Figure 1 - High priority GY-A and GY-B Au in soil anomalies with finished, current, and pending drilling In the El Guaybo concession**

**Challenger Exploration (ASX: CEL)** ("CEL" the "**Company**") is pleased to announce results from the Company's first two drillholes from the El Guayabo Gold-Copper Project in El Oro Province, Ecuador. The results confirm the discovery of a significant intrusion hosted gold-copper-silver-molybdenum system with both holes encountering wide zones of mineralisation associated with intrusives and intrusive breccias. The first two holes have intersected two zones of mineralisation extending over 800 metres of strike on a 1.8 kilometre long gold in soil anomaly.

The Company now has two HC 5000 drill rigs on site with a depth capacity of 1,200 metres using NQ core rods. The second rig was mobilised to site after the completion of the third drill hole, GYDD-21-003, due to the broad and consistent zones of mineralisation noted during logging. The Company is currently completing GYDD-21-007 and GYDD-21-008 with average drill metres per shift steadily increasing. Additionally, assay turn-around times in South America have improved significantly since December.

#### **GYDD-21-001**

GYDD-21-001 was collared to test a 1.8 kilometre long gold in soil anomaly defined in the Company's 100% owned El Guayabo concession. The hole encountered a significant zone of mineralisation from near surface to the end of the hole intersecting **784.3 metres at 0.4 g/t AuEq (0.2 g/t Au, 1.6 g/t Ag, 0.1 % Cu, 12 ppm Mo)** from 16.2m. This mineralisation is hosted in intrusives and intrusive breccia and is consistent and pervasive throughout the length of the drill hole. The mineralisation included a higher grade core of **380.5 metres at 0.5 g/t AuEq (0.3 g/t Au, 2.0 g/t Ag, 0.1 % Cu, 18 ppm Mo)** from 167.5m including **188.5 metres at 0.6 g/t AuEq (0.4 g/t Au, 2.3 g/t Ag, 0.1 % Cu, 30 ppm Mo)** from 359.5m. This 188.5 metres central core containing higher-grade components of **21.0 metres at 1.1 g/t AuEq (0.8 g/t Au, 3.0 g/t Ag, 0.2 % Cu, 139 ppm Mo)** from 403.0m and **30.0 metres at 1.1 g/t AuEq (0.8 g/t Au, 2.6 g/t Ag, 0.2 % Cu, 25 ppm Mo)** from 468.5m.

As Figure 1 (previous page) shows GYDD-21-001 was located in a lower priority section of a 1.8 km long gold in soil anomaly with the high-grade 550 metre core of the anomaly starting 100 metres to the south-west of GYDD-21-001. The high-priority section of this 1.8 kilometre anomaly is being tested in following drillholes GYDD-21-003, GYDD-21-004, GYDD-21-005, GYDD-21-006 (assays pending) and GYDD-21-007 and GYDD-21-008 (in progress). The Company took the decision to start the program with two lower priority drill holes given these pad location provided the easiest access. Additionally, the geochemical anomaly currently being tested is the first of nine similar anomalies which will be tested. Drilling on the highest priority of these targets, located in Colorado V, is programmed to start in the current quarter.

In the context of its location, off the main high-grade section of the underlying gold in soil anomaly, drill hole GYDD-21-001 delivered an outstanding result. The mineralisation reflects the underlying soil geochemistry with consistent mineralisation across the hole and a higher-grade core that correlates with the central part of the soil anomaly in this location. The gold in soil values on the GYDD-21-001 location is approximately 30ppb with drill holes GYDD-003 and GYDD-004 (assays pending located 200 metres south-west along strike) and GYDD-005 and GYDD-006 (assays pending located a further 250 metres south-west along strike) all collared over gold in soil values near double that of GYDD-21-001.

## GYDD-21-002

GYDD-21-002 was drilled targeting underground workings in the Salinas Mine adit, where underground sampling of the historical workings has returned a channel sample interval of **69.4 metres at 0.3g/t AuEq (0.2 g/t Au, 8 g/t Ag, 0.1 % Cu, 4 ppm Mo)**, including **31.6 metres at 0.6g/t AuEq (0.3 g/t Au, 14 g/t Ag, 0.1 % Cu, 5 ppm Mo)** with a central core of **10 metres at 0.9g/t AuEq (0.2 g/t Au, 36 g/t Ag, 0.2 % Cu, 4 ppm Mo)**.

GYDD-21-002 intersected several zones of mineralisation including **46.5 metres at 0.4 g/t AuEq (0.3 g/t Au, 4.0 g/t Ag, 0.04 % Cu, 6 ppm Mo)** from 85.0m and **27.1 metres at 1.5 g/t AuEq (1.5 g/t Au, 0.8 g/t Ag, 0.02 % Cu, 2 ppm Mo)** from 279.5m including **1.5 metres at 19.2 g/t AuEq (19.1/t Au, 1.9 g/t Ag, 0.03 % Cu, 3 ppm Mo)** within a greater mineralised interval of **320.0 metres at 0.3 g/t AuEq (0.3 g/t Au, 1.2 g/t Ag, 0.02 % Cu, 2 ppm Mo)** from 83.5m. This represents a new zone of mineralisation and is interpreted to lie stratigraphically above the mineralisation intersected in GYDD-21-001.

The decision was made to extend GYDD-21-002 to 650 metres to collect stratigraphic and structural information on the north-eastern extension of zone drilled in GYDD-21-001 (Figure 1). The extension of GYDD-21-002 was prognosed to intersect this zone 800 metres north-east of GYDD-21-001 at the extreme north-eastern end of the greater 1.8 kilometre long gold in soil anomaly tested in GYDD-21-001. Importantly, this extension of GYDD-21-002 encountered a zone of mineralisation hosted in intrusive breccia intersecting **58.0 metres at 0.2 g/t AuEq (0.1 g/t Au, 0.3 g/t Ag, .01 % Cu, 2 ppm Mo)** from 499.8m containing several splits greater than 0.5 g/t AuEq.

This intercept near the end of hole in GYDD-21-002 is highly encouraging. Both holes drilled on the eastern half of this 1.8 kilometre gold in soil anomaly intersected mineralisation with the much higher-grade western half of the 1.8 kilometre gold in soil anomaly to be tested in drillholes GYDD-21-003, GYDD-21-004, GYDD-21-005, GYDD-21-006 (assays pending), and GYDD-21-007 and GYDD-21-008 (in progress).

See below for information regarding AuEq's reported under the JORC Code.

#### <sup>2</sup> Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1780 Oz, Ag US\$22 Oz, Cu US\$9,650 /t, Mo US\$40,500 /t.
- Metallurgical recovery factors for gold, silver, copper, and molybdenum are assumed to be equal. No metallurgical factors have been applied in calculating the Au Eq.
- The formula used:  $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times (22/1780)] + [Cu (\%) \times (9650/100 \times 31.1/1780)] + [Mo (\%) \times (40500/100 \times 31.1/1780)]$ .
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

## About Challenger Exploration

Challenger Exploration Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America. The strategy for the 100% owned Hualilan Gold project is for it to provide a high-grade low capex operation in the near term. This underpins CEL with a low risk, high margin source of cashflow while it prepares for a much larger bulk gold operation at both Hualilan and El Guaybo in Ecuador.

The Company is fully funded for the next 2 years with cash at bank of \$30 million and it has committed to a 9-rig 120,000 metre drill program at its Flagship Hualilan Gold project.

1. **Hualilan Gold Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive historical drilling with over 150 drill-holes and a non-JORC historical resource <sup>(1)</sup> of 627,000 Oz @ 13.7 g/t gold which remains open in most directions. The project was locked up in a dispute for the past 15 years and as a consequence had seen no modern exploration until CEL acquired the project in 2019. In the past 2 years CEL has completed 495 drill holes for more than 130,000 metres of drilling. Results have included **6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 6.7m @ 14.3 g/t Au, 140 g/t Ag, 7.3% Zn and 10.3m @ 10.4 g/t Au, 28 g/t Ag, 4.6% Zn**. This drilling intersected high-grade gold over almost 2 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including **209.0m at 1.0 g/t Au, 1.4 g/t Ag, 0.1% Zn and 110.5m at 2.5 g/t Au, 7.4 g/t Au, 0.90% Zn** in intrusives. CEL's current program which is fully funded will take metres drilled by CEL to 204,000 metres, and include metallurgical test work of key ore types, and an initial JORC Compliant Resource and PFS.
2. **El Guayabo Gold/Copper Project** covers 35 sq kms in southern Ecuador and was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling has demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including **156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t Ag** which have never been followed up. The Project has multiple targets including breccia hosted mineralisation, an extensive flat lying late-stage vein system and an underlying porphyry system target neither of which has been drill tested. CEL's first results confirm the discovery of large-scale gold system with over 250 metres of bulk gold mineralisation encountered in drill hole ZK-02 which contains a significant high-grade core of **134m at 1.0 g/t gold and 4.1 g/t silver** including **63m at 1.6 g/t gold and 5.1 g/t silver**.

*#1 For details of the foreign non-JORC compliant resource and to ensure compliance with LR 5.12 please refer to the Company's ASX Release dated 25 February 2019. These estimates are foreign estimates and not reported in accordance with the JORC Code. A competent person has not done sufficient work to clarify the foreign estimates as a mineral resource in accordance with the JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimate will be able to be reported as a mineral resource. The company is not in possession of any new information or data relating to the foreign estimates that materially impact on the reliability of the estimates that materially impacts on the reliability of the estimates or CEL's ability to verify the foreign estimates estimate as minimal resources in accordance with Appendix 5A (JORC Code). The company confirms that the supporting information provided in the initial market announcement on February 25, 2019 continues to apply and is not materially changed.*

**Competent Person Statement – Exploration results**

The information that relates to sampling techniques and data, exploration results and geological interpretation has been compiled Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

**Competent Person Statement – Foreign Resource Estimate**

The information in this release provided under ASX Listing Rules 5.12.2 to 5.12.7 is an accurate representation of the available data and studies for the material mining project. The information that relates to Mineral Resources has been compiled by Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration to qualify as Competent Person as defined in the 2012 Edition of the JORC Code for Reporting of, Mineral Resources and Ore Reserves. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1 Sampling Techniques and Data -El Guayabo Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>- <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li> <li>- <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li> <li>- <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li> <li>- <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li> </ul>	<p><b>El Guayabo:</b></p> <ul style="list-style-type: none"> <li>• Newmont Mining Corp (NYSE: NEM) ("<b>Newmont</b>") and Odin Mining and Exploration Ltd (TSX: ODN) ("<b>Odin</b>") core drilled the property between February 1995 and November 1996 across two drilling campaigns.</li> <li>• The sampling techniques were reviewed as part of a 43-101 Technical report on Cangrejos Property which also included the early results of the El Joven joint venture between Odin and Newmont, under which the work on the El Guayabo project was undertaken. This report is dated 27 May 2004 and found the sampling techniques and intervals to be appropriate with adequate QA/QC and custody procedures, core recoveries generally 100%, and appropriate duplicates and blanks use for determining assay precision and accuracy.</li> <li>• Duplicates were prepared by the Laboratory (Bonder Cleg) which used internal standards. Newmont also inserted its own standards at 25 sample intervals as a control on analytical quality</li> <li>• Diamond drilling produced core that was sawed in half with one half sent to the laboratory for assaying per industry standards and the remaining core retained on site.</li> <li>• Cu assays above 2% were not re-assayed using a technique calibrated to higher value Cu results hence the maximum reported assay for copper is 2%.</li> <li>• All core samples were analysed using a standard fire assay with atomic absorption finish on a 30 g charge (30 g FAA). Because of concerns about possible reproducibility problems in the gold values resulting from the presence of coarse gold, the coarse crusher rejects for all samples with results greater than 0.5 g/t were re-assayed using the "blaster" technique - a screen type fire analysis based on a pulverized sample with a mass of about 5 kg. Samples from most of these intersections were also analysed for Cu, Mo, Pb, Zn and Ag.</li> <li>• CEL has re-sampled sections of the Newmont and Odin drill core. ¼ drill core was cutover intervals that replicated the earlier sampling. Sample intervals ranged from 0.7 – 4.5m with an average of 2.0m. 533 samples totaling 1,094.29m were collected. Sampling was done for Au analysis by fire assay of a 30g charge and 43 element 4-acid digest with ICP_AES determination.</li> <li>• Field mapping (creek traverse) by CEL includes collection of rock chip samples for assay for</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>Au by fire assay (50g) with AAS determination and gravimetric determination for values &gt; 10 g/t Au and assay for 48 elements by 4-acid digest with ICP-MS determination. Rock chip samples are taken so as to be as representative as possible of the exposure being mapped.</p> <p><b>Colorado V:</b></p> <ul style="list-style-type: none"> <li>Soil sampling: A database of 4,495 soil analyses has been provided by Goldking Mining Company S.A. (GK) which has yet to be fully evaluated. No information has been provided on the method of sample collection or assay technique. The soil analyses include replicate samples and second split analyses. Pulps have been securely retained by Goldking Mining Company and have been made available to CEL for check assaying. Check assaying is planned, including collection of field duplicates.</li> <li>Rock chip sampling during regional mapping has been done on selected exposures. Sampling involves taking 2-3 kg of rock using a hammer from surface exposures that is representative of the exposure.</li> <li>Selected intervals of drill core have been cut longitudinally and half core were submitted for gold determination at GK's on-site laboratory prior to CEL's involvement with the Project.</li> <li>Re-sampling of the core involves taking ¼ core (where the core has previously been sampled) or ½ core (where the core has not previously been sampled). The core is cut longitudinally and sample intervals of 1 – 3 meters have been collected for analysis. ZK0-1 and ZK1-3 have been analysed for of gold by fire assay (30g) with ICP determination and other elements by 4 acid digest with ICP-AES finish (36 elements) at SGS del Peru S.A.C. SAZK0-1, SAZK0-2, SAZK2-1, ZK0-2, ZK0-5, ZK1-5, ZK1-6, ZK2-1, ZK3-1, ZK3-4, ZK13-1 and ZK18-1 have been analysed for of gold by fire assay (30g) with ICP determination and other elements by 4 acid digest with combined ICP-AES and ICP-MS finish (50 elements) at SGS del Peru S.A.C. Samples from other holes have been analysed for gold by fire assay (30g) with ICP determination and overlimit (&gt;10 g/t Au) by fire assay with gravimetric determination and other elements by 4-acid digest with ICP-MS (48 elements) at ALS Laboratories in Peru.</li> <li>Underground development has been mapped and channel sampled. Channel samples have been taken by cutting a horizontal channel of approximately 5 cm width and 4 cm depth into the walls at a nominal height of 1m above the ground. The channel cuts were made with an angle grinder mounted with a diamond blade. Samples were extracted from the channel with a hammer and chisel to obtain a representative sample with a similar weight per metre as would be obtained from a drill core sample. Analysis of the samples has been done by ALS Laboratories in Peru using the same preparation and analysis as has been used</li> </ul>

crushed and a 500g sub-sample was pulverized to 85% passing 75  $\mu\text{m}$ . The technique provides for a near total analysis of the economic elements of interest.

- CEL rock chip samples were prepared for assay at ALS Laboratories (Quito) with analysis being completed at ALS Laboratories (Peru). The fire assay and 4-acid digest provide for near-total analysis of the economic elements of interest. No standards or blanks were submitted with the rock chip samples.

#### Colorado V:

- No information is available on the methods used to analyse the soil or drill core samples. Assay results are not provided in this report. Soil samples have been analysed by GK for Au, Cu, Ag, Zn, Pb, As, Mn, Ni, Cr, Mo, Sn, V, Ti, Co, B, Ba, Sb, Bi and Hg. Pulps have been securely retained and check assaying is planned.
- Drill core was partially assayed for gold only with assays undertaken by Goldking's on site laboratory
- CEL samples of drill core re-sampled by CEL blanks and CRM (standards) added to the batches to check sample preparation and analysis.

3 separate CRM's were included in the batches sent for analysis. All three have certified Au values. The results of the analysis of the CRM is shown below. With a few exceptions, the CRM has returned results within  $\pm 2$  SD of the certified reference value. There is no bias in the results returned from either SGS or ALS laboratories.

CRM3 analyses by fire assay at SGS did not include overlimit ( $>10$  g/t).

- No duplicate samples have been submitted.
- Two different blanks have been included randomly within the sample batches. A CRM

## Criteria

## JORC Code explanation

## Commentary

blank with a value of <0.01 ppm (10 ppb) Au was used initially. More recent batches have used a blank gravel material which has no certified reference value. The results are shown below. The first 4 gravel blanks show elevated Au values which is believed to be due to contamination of the blank prior to submission and not due to laboratory contamination. With one exception, the blanks have returned values below 10 ppb.

**Verification of sampling and assaying**

- The verification of significant intersections by either independent or alternative company personnel.
- The use of twinned holes.
- Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.
- Discuss any adjustment to assay data.

**El Guayabo:**

- All intersections with results greater than 0.5 g/t were re-assayed using the “blaster” technique - a screen type fire analysis based on a pulverised sample with a mass of about 5 kg. Additionally, Odin re-assayed the many of the higher-grade sections with re-assay results demonstrating repeatability of the original results.
- Neither Newmont nor Odin attempted to verify intercepts with twinned holes
- Data was sourced from scanned copies of original drill logs and in some cases original paper copies of assay sheets are available. This data is currently stored in a drop box data base with the originals held on site.
- No adjustments to assay data were made.
- CEL assay data has not been independently verified or audited. Data is stored electronically in MS Excel and PDF format from the Laboratory and entered into a Project database for analysis. There has been no adjustment of the data.

**Colorado V:**

- There is no information available on the verification of sample and assay results. No assay data is provided in this report. Soil replicate samples and second split assay results have been provided but not fully analysed at this stage.
- Of the 4,495 soil samples in the GK database, 166 are replicate samples and 140 are second split re-analyses. 37 samples have no co-ordinates in the database.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>- The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>- The El Guayabo (Code. 225) mining concession is located within El Oro Province. The concession is held by Torata Mining Resources S.A (TMR S.A) and was granted in compliance with the Mining Act ("MA") in on April 27, 2010. There are no overriding royalties on the project other than normal Ecuadorian government royalties.</li> <li>- The property has no historical sites, wilderness or national park issues.</li> <li>- The mining title grants the owner an exclusive right to perform mining activities, including, exploration, exploitation and processing of minerals over the area covered by the prior title for a period of 25 years, renewable for a further 25 years. Under its option agreement, the owner has been granted a negative pledge (which is broadly equivalent to a fixed and floating charge) over the concession. In addition, a duly notarized Irrevocable Promise to Transfer executed by TMR S.A in favor of AEP has been lodged with the Ecuador Mines Department.</li> <li>- The Colorado V mining concession (Code No. 3363.1) located in Bellamaria, Santa Rosa, El Oro, Ecuador was granted in compliance with the Mining Act ("MA") in on July 17, 2001. It is adjacent to El Guayabo concession to the north. The concession is held by Goldking Mining Company S.A. There are no overriding royalties on the project other than normal Ecuadorian government royalties.</li> <li>- The concession has no historical sites, wilderness or national park issues.</li> <li>- The El Guayabo 2 (Code. 300964) mining concession is located Torata parish, Santa Rosa canton, El Oro province, Ecuador. The concession is held by T Mr. Segundo Ángel Marín Gómez and Mrs. Hermida Adelina Freire Jaramillo and was granted in compliance with the Mining Act ("MA") on 29April 29, 2010. There are no overriding royalties on the project other than normal Ecuadorian government royalties.</li> <li>- The property has no historical sites, wilderness, or national park issues.</li> </ul>
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>- Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<p><b>El Guayabo:</b></p> <ul style="list-style-type: none"> <li>- Previous exploration on the project has been undertaken by Newmont and Odin from 1994 to 1997. This included surface pit and rock chip geochemistry, followed by the drilling of 33 drill holes for a total of 7605.52 meters) to evaluate the larger geochemical anomalies.</li> <li>- The collection of all exploration data by Newmont and Odin was of a high standard and had appropriate sampling techniques and intervals, adequate QA/QC and custody procedures, and appropriate duplicates and blanks used for determining assay precision and accuracy.</li> <li>- The geological interpretation of this data, including core logging and follow up geology was designed and directed by in-country inexperienced geologists. It appears to have been focused almost exclusively for gold targeting surface gold anomalies or the depth extensions of higher-grade gold zones being exploited by the artisanal miners. The geologic logs for all drill holes did not record details that would have been typical, industry standards for porphyry</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>copper exploration at that time. Several holes which ended in economic mineralisation have never been followed up.</p> <ul style="list-style-type: none"> <li>- In short, important details which would have allowed the type of target to be better explored were missed which in turn presents an opportunity to the current owner.</li> </ul> <p><b>Colorado V:</b></p> <ul style="list-style-type: none"> <li>- All exploration known has been completed by GK. Drilling has been done from 2016 to 2019. 56 drill holes, totaling 21,471.83m have been completed by GK.</li> </ul> <p><b>El Guayabo 2:</b></p> <ul style="list-style-type: none"> <li>- Exploration work undertaken by the previous owner was limited to field mapping and sampling including assaying of a small number of samples for gold, silver, copper, lead and zinc. The report is only available in Spanish and assays were conducted in a local laboratory in Ecuador with the majority of this work undertaken in 2017.</li> </ul>
<b>Geology</b>	<ul style="list-style-type: none"> <li>- <i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>	<ul style="list-style-type: none"> <li>- It is believed that the El Guayabo, El Guayabo 2, and Colorado V concessions contain a “Low Sulfide” porphyry gold copper system and intrusive-related gold. The host rocks for the intrusive complex is metamorphic basement and Oligocene – Mid-Miocene volcanic rocks. This suggests the intrusions are of a similar age to the host volcanic sequence, which also suggests an evolving basement magmatic system. Intrusions are described in the core logs as quartz diorite and dacite. Mineralisation has been recognized in: <ul style="list-style-type: none"> <li>– Steeply plunging breccia bodies and in the metamorphic host rock adjacent to the breccia (up to 200 m in diameter)</li> <li>– Quartz veins and veinlets</li> <li>– Disseminated pyrite and pyrrhotite in the intrusions and in the metamorphic host rock near the intrusions.</li> </ul> </li> </ul>
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>- <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <ul style="list-style-type: none"> <li>o <i>easting and northing of the drill hole collar</i></li> <li>o <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i></li> <li>o <i>dip and azimuth of the hole</i></li> <li>o <i>down hole length and interception depth</i></li> <li>o <i>hole length.</i></li> </ul> </li> <li>- <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does</i></li> </ul>	<p>El Guayabo drill hole information is provided below.</p>

Criteria	JORC Code explanation	Commentary
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>- <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i></li> <li>- <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></li> <li>- <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></li> </ul>	<p>No grade cutting has been used to derive the weighted average grades reported.</p> <ul style="list-style-type: none"> <li>• Minimum cut of grade of 0.2 g/t Au Equivalent (AuEq) was used for determining intercepts.</li> <li>- Aggregate intercepts have been reported with higher grade inclusions to demonstrate the impact of aggregation. A bottom cut of 0.5 g/t Au Equivalent has been used to determine the higher-grade inclusions. Given the generally consistent nature of the mineralisation the impact of the aggregation of high-grade results and longer lengths of low-grade results does not have a large impact. For example, in the intercept of 156m @ 2.6 g.t Au in hole GGY-02: <ul style="list-style-type: none"> <li>– over half of the intercept comprises gold grades in excess of 1 g/t Au</li> <li>– only 20% of the intercept includes grades between 0.2 and 0.5 g/t Au</li> <li>– over one third includes gold grades in excess of 2 g/t Au.</li> </ul> </li> <li>• Au Eq assumes a gold price of USD 1,780/oz, a silver price of USD 22 /oz, a copper price of USD 9,650 /t, and a Molybdenum price of US\$45,500</li> <li>• Metallurgical recovery factors for gold, silver, copper, and Molybdenum are assumed to be equal. No metallurgical factors have been applied in calculating the Au Eq, hence the formula for calculating the Au Eq is: <math>Au (g/t) + (Ag (g/t) \times 22/1780) + (1.68604 \times Cu (\%)) + (7.07612 \times Mo (\%))</math>.</li> <li>• CEL confirms that it is the company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.</li> </ul>

#### Colorado V:

A cut-off grade of 0.1 g/t Au was used to report the assays of re-samples core and channel samples from underground development with up to 10 metres of internal dilution below cut-off allowable for the reporting of significant intercepts, consistent with a large low-grade mineralized system. Intersections that use a different cut-off are indicated.

#### Colorado V drill hole results from re-sampling of available core:

Hole_id	From (m)	To (m)	Interval (m)	Au (g/t)	Ag (g/t)	Cu (ppm)	Mo (ppm)	Note
ZK0-1	9.4	37.5	28.1	0.4	1.0

<b>Relationship between mineralisation</b>	-	<i>These relationships are particularly important in the reporting of</i>	-	The geometry of the breccia hosted mineralisation appears to be predominantly vertical pipes while the geometry of the intrusive hosted mineralisation is not yet clear. The owner cautions that only and only the down hole lengths are reported and the true width of mineralisation is not known.

Criteria	JORC Code explanation	Commentary
	<i>locations and appropriate sectional views.</i>	
<b>Balanced reporting</b>	- <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	- The reporting is fair and representative of what is currently understood of the geology of the project.
<b>Other substantive exploration data</b>	- <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	<p><b>El Guayabo:</b>  Quantec Geophysical services conducted a SPARTAN Broadband Magnetotelluric and TITAN IP/EMAP surveys completed February 3rd to April 1st, 2019 over the El Guayabo property by Quantec Geoscience Ltd. on behalf of AAR Resources. The survey covered 16 square kilometers with data collected on 300m 3D spacing on a grid oriented at 10 degrees and 100 degrees. The grid was moved 10 degrees so the survey could be oriented perpendicular to the main geological structures. The survey involved a total of 205 Magnetotelluric (MT) sites and 2 test TITAN IP/EMAP profiles were surveyed. The final survey results to which will be delivered will consist of :</p> <ul style="list-style-type: none"> <li>• Inversion 2D products <ul style="list-style-type: none"> <li>• 2D model sections (for each line) of the:</li> <li>• DC resistivity model;</li> <li>• IP chargeability model using the DC resistivity model as a reference;</li> <li>• IP chargeability model using a half-space resistivity model as a reference;</li> <li>• MT(EMAP) resistivity model;</li> <li>• Joint MT+DC resistivity model; IP chargeability model using the MT+DC resistivity model;</li> </ul> </li> <li>• Inversion 3D products <ul style="list-style-type: none"> <li>• 3D MT model; <ul style="list-style-type: none"> <li>• Cross-sections and Elevation Plan maps of the 3D MT models;</li> </ul> </li> </ul> </li> </ul> <p>Figures showing Survey Locations and Results are included in the body of this release</p> <p><b>DCIP INVERSION PROCEDURES</b>  DCIP is an electrical method that uses the injection of current and the measurement of voltage difference along with its rate of decay to determine subsurface resistivity and chargeability respectively. Depth of investigation is mainly controlled by the array geometry but may also be limited by the received signal (dependent on transmitted current) and ground resistivity. Chargeability is particularly susceptible to data with a low signal-to-noise ratio. The differences in penetration depth between DC resistivity and chargeability are a function of relative property contrasts and relative signal-to-noise levels between the two measurements. A detailed introduction to DCIP is given in Telford, et al. (1976). The primary tool for evaluating data is through the inversion of the data in two or three dimensions. An inversion model depends not only on the data collected, but also on the associated data errors in the reading and the “model norm”. Inversion models are not unique</p>

Criteria	JORC Code explanation	Commentary
		<p>and may contain “artefacts” from the inversion process. The inversion model may not accurately reflect all the information apparent in the actual data. Inversion models must be reviewed in context with the observed data, model fit, and with an understanding of the model norm used.</p> <p>The DC and IP inversions use the same mesh. The horizontal mesh is set as 2 cells between electrodes. The vertical mesh is designed with a cell thickness starting from 20 m for the first hundred metres to accommodate the topographic variation along the profiles, and then increases logarithmically with depth. The inversions were generally run for a maximum of 50 iterations. The DC data is inverted using an unconstrained 2D inversion with a homogenous half-space of average input data as starting model. For IP inversions, the apparent chargeability <math>\rho</math> is computed by carrying out two DC resistivity forward models with conductivity distributions <math>\sigma(\mathbf{x}i,\mathbf{z}j)</math> and <math>(1-\eta)\sigma(\mathbf{x}i,\mathbf{z}j)</math> (Oldenburg and Li, 1994), where <math>(\mathbf{x}i,\mathbf{z}j)</math> specifies the location in a 2D mesh. The conductivity distributions used in IP inversions can be the inverted DC model or a half space of uniform conductivity. Two IP inversions are then calculated from the same data set and parameters using different reference models. The first inversion of the IP data uses the previously calculated DC model as the reference model and is labelled the IP dcresf model. The second IP inversion uses a homogeneous half-space resistivity model as the reference model and is labelled IP hresf model. This model is included to test the validity of chargeability anomalies, and to limit the possibility of inversion artefacts in the IP model due to the use of the DC model as a reference. The results of this second IP inversion are presented on the digital archived attached to this report.</p> <p><b>MAGNETOTELLURIC INVERSIONS</b></p> <p>The Magnetotelluric (MT) method is a natural source EM method that measures the variation of both the electric (E) and magnetic (H) field on the surface of the earth to determine the distribution at depth of the resistivity of the underlying rocks. A complete review of the method is presented in Vozoff (1972) and Orange (1989).</p> <p>The measured MT impedance Z, defined by the ratio between the E and H fields, is a tensor of complex numbers. This tensor is generally represented by an apparent resistivity (a parameter proportional to the modulus of Z) and a phase (argument of Z). The variation of those parameters with frequency relates the variations of the resistivity with depth, the high frequencies sampling the sub-surface and the low frequencies the deeper part of the earth. However, the apparent resistivity and the phase have an opposite behaviour. An increase of the phase indicates a more conductive zone than the host rocks and is associated with a decrease in apparent resistivity. The objective of the inversion of MT data is to compute a distribution of the resistivity of the surface that explains the variations of the MT parameters, i.e. the response of the model that fits the observed data. The solution however is not unique and different inversions must be performed (different programs, different conditions) to test and compare solutions for artefacts versus a target anomaly.</p> <p>An additional parameter acquired during MT survey is the Tipper. Tipper parameters Tzx and Tzy (complex numbers) represent the transfer function between the vertical magnetic field and the horizontal X (Tzx), and Y (Tzy) magnetic fields respectively (as the impedance Z represent the transfer function between the electric and magnetic fields). This tipper is a ‘local’ effect, mainly defined by the lateral contrast of the resistivity. Consequently, the tipper can be used to estimate the geological strike direction. Another important use of the tipper is to display its components as vectors, named induction vectors. The induction vectors (defined by the real components of Tzx and Tzy) plotted following the Parkinson-Real-Reverse-Angle convention will point to conductive zones. The tipper is then a good mapping tool to delineate more conductive zones.</p>

Criteria	JORC Code explanation	Commentary												
		<p>The depth of investigation is determined primarily by the frequency content of the measurement. Depth estimates from any individual sounding may easily exceed 20 km. However, the data can only be confidently interpreted when the aperture of the array is comparable to the depth of investigation.</p> <p>The inversion model is dependent on the data, but also on the associated data errors and the model norm. The inversion models are not unique, may contain artefacts of the inversion process and may not therefore accurately reflect all the information apparent in the actual data. Inversion models need to be reviewed in context with the observed data, model fit. The user must understand the model norm used and evaluate whether the model is geologically plausible.</p> <p>For this project, 2D inversions were performed on the TITAN/EMAP profiles data. For each profile, we assume the strike direction is perpendicular to the profile for all sites: the TM mode is then defined by the inline E-field (and cross line H-field); no TE mode (crossline E-field) were used in the 2D inversions.</p> <p>The 2D inversions were performed using the TM-mode resistivity and phase data interpolated at 6 frequencies per decade, assuming 10% and 5% error for the resistivity and phase respectively, which is equivalent to 5% error on the impedance component Z. No static shift of the data has been applied on the data.</p> <p>The 3D inversion was carried out using the CGG RLM-3D inversion code. The 3D inversions of the MT data were completed over an area of approximately 5km x 3.5km. All MT sites from this current survey were used for the 3D inversion.</p> <p>The 3D inversion was completed using a sub sample of the MT data with a maximum of 24 frequencies at each site covering the measured data from 10 kHz to 0.01 Hz with a nominal 4 frequencies per decade. At each site, the complete MT complex impedance tensors (Zxx, Zxy, Zyx, and Zyy) were used as input data with an associated error set to 5% on each parameter. The measured tipper data (Tzx, Tzy) were also used as input data with an associated error set to 0.02 on each parameter. A homogenous half space with resistivity of 100 Ohm-m was used as the starting model for this 3D MT inversion. A uniform mesh with 75 m x 75 m cell size was used in horizontal directions in the resistivity model. The vertical mesh was defined to cover the first 4 km. Padding cells were added in each direction to accommodate the inversion for boundary conditions. The 3D inversion was run for a maximum of 50 iterations.</p> <p>In addition a total of 129 samples distributed along 12 holes were analysed to measure the resistivity (Rho (Ohm*m) and chargeability properties (Chargeability M and Susceptibility (SCPT 0.001 SI) . The equipment used for the analyses was the Sample Core IP Tester, manufactured by Instrumentation GDD Inc. It should be noted that these measures should be taken only as first order estimate, and not as “absolute” (true) value as readings by the field crew were not repeated and potentially subject to some errors (i.e. wrong size of the core entered in the equipment).</p> <p><b>Colorado V:</b></p> <p>Exploration Target:</p> <p>An Exploration Target for two mineralized zones on the Colorado V mining concession has been made using surface gold in soil anomalies, drill hole geological and assay information and panel sampling from an adit at one of the targets.</p> <table><tr><th>Exploration Target Anomaly A</th><th>Unit</th><th>Low estimate</th><th>High Estimate</th></tr><tr><td>Surface area (100 ppb Au in soil envelope):</td><td>m<sup>2</sup></td><td>250000</td><td>250000</td></tr><tr><td>Depth</td><td>m</td><td>400</td><td>400</td></tr></table>	Exploration Target Anomaly A	Unit	Low estimate	High Estimate	Surface area (100 ppb Au in soil envelope):	m <sup>2</sup>	250000	250000	Depth	m	400	400

		The potential quantity and grade of the Colorado V Exploration Target is conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource and that it is uncertain if further exploration will result in the estimation of a Mineral Resource.			
		The following is an explanation of the inputs used in formulating the Exploration Target.			
		• Surface Area: The surface area of the target has been estimated by projecting drill hole gold significant intersections
