

## **THICK 40m INTERSECTION @ 1.54% Li<sub>2</sub>O CONFIRMS SIGNIFICANT UPSIDE POTENTIAL**

### **HIGHLIGHTS**

- **Significant lithium bearing pegmatite intersected in the first hole (GTDD-21-0004) completed in Phase 1 extensional diamond drilling at the North Aubry deposit (Seymour Project).**
- **The intercept of 40m @ 1.54% Li<sub>2</sub>O (from 244m downhole) confirms pegmatite continuity and thickening down-dip of at least 50m beyond the margins of the existing Mineral Resource estimate.**
- **This hole is the first of an 11-hole, 3,500m drilling program, seeking to expand the current Seymour Mineral Resource estimate of 4.8 Mt @ 1.25% Li<sub>2</sub>O.**
- **Seymour drilling has now recommenced for 2022 with the second hole in progress and a second diamond drill rig also currently setting up onsite.**
- **The Phase 1 program is expected to be completed during March 2022.**

Green Technology Metals Limited (**ASX: GT1**)(**Green Technology, GT1** or the **Company**) is pleased to announce that assay results have been returned for the first drill hole of the Phase 1 diamond drilling at the North Aubry deposit within its Seymour Project in Ontario, Canada.

The first hole completed, GTDD-21-0004, was targeting downdip extensions beyond an historical intercept and has returned a thick and continuous intercept of 40m @ 1.54% Li<sub>2</sub>O (from 244m downhole; see Table 1), confirming GT1's geological modelling and drill targeting. This result represents an excellent start to the Phase 1 drilling program and delivers immediate potential for growth in the existing Seymour Mineral Resource estimate of 4.8 Mt @ 1.25% Li<sub>2</sub>O.

The Phase 1 program at Seymour, consisting of a planned 11 holes for approximately 3,500m, is designed to evaluate potential along-strike and down-dip extensions of the North Aubry deposit that are currently open and untested. The Phase 1 drilling is seeking to aggressively expand the existing Seymour Mineral Resource estimate, with the program expected to be completed during March 2022.

Drilling at Seymour has now recommenced for 2022 with the second drill hole of the Phase 1 program in progress. A second diamond drill rig has also arrived onsite and is expected to enter operation in the next week, delivering accelerated dual-cycled drilling progress.

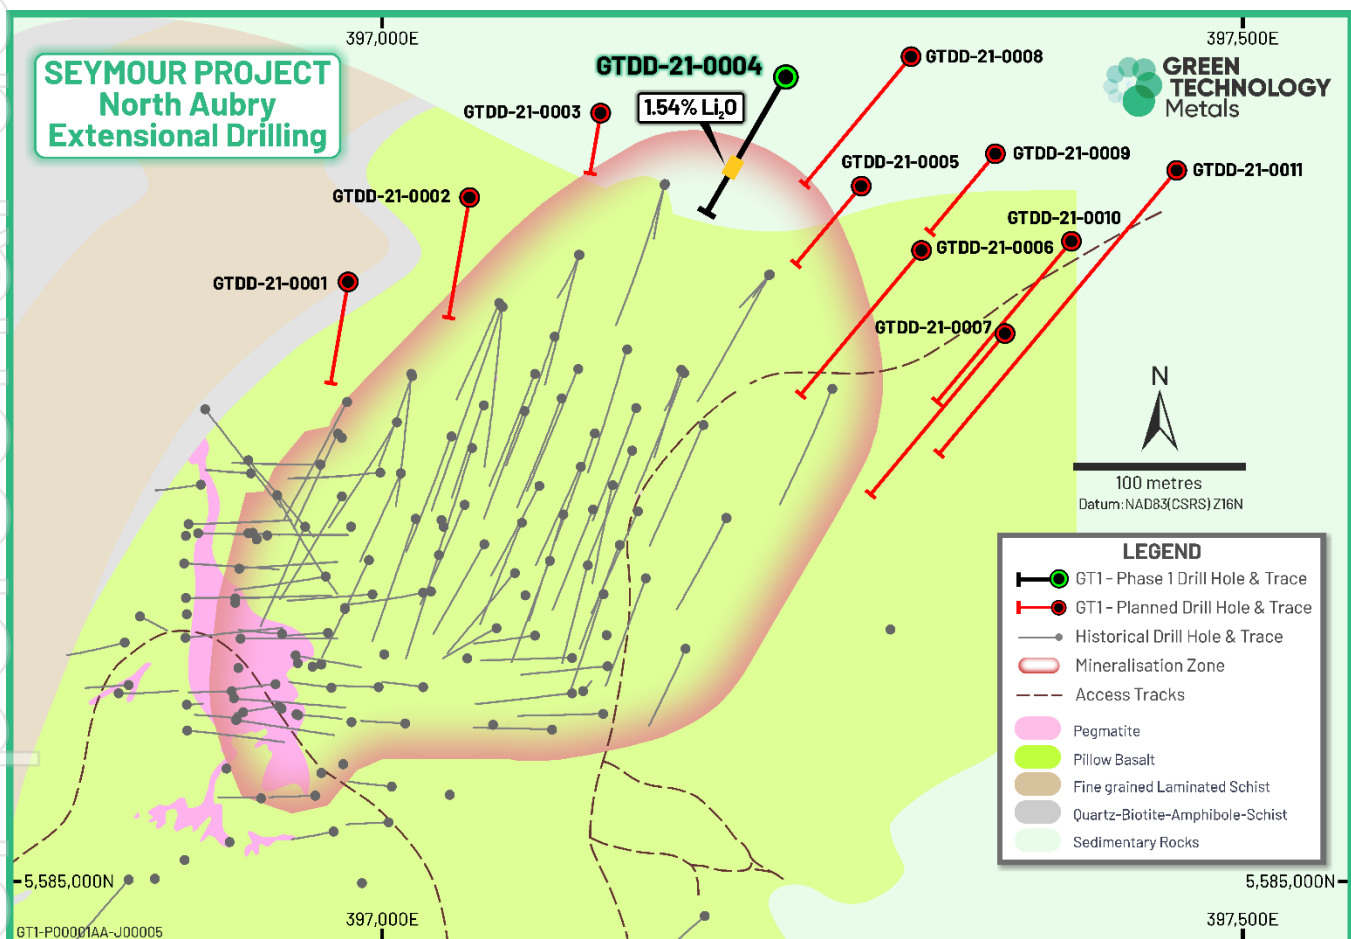

*"The results returned from our maiden hole at Seymour represent an excellent start to the Phase 1 diamond program. This first hole was located on the north-east extremity of the currently delineated mineralised envelope at Seymour. By intersecting 40 metres thick lithium bearing pegmatite in this area, at such a good grade, the result presents strong evidence of the latent high-grade extensional potential of the North Aubry, and broader Seymour, system. Such sustained thickness down-dip also significantly enhances the potential mining economics at Seymour."*

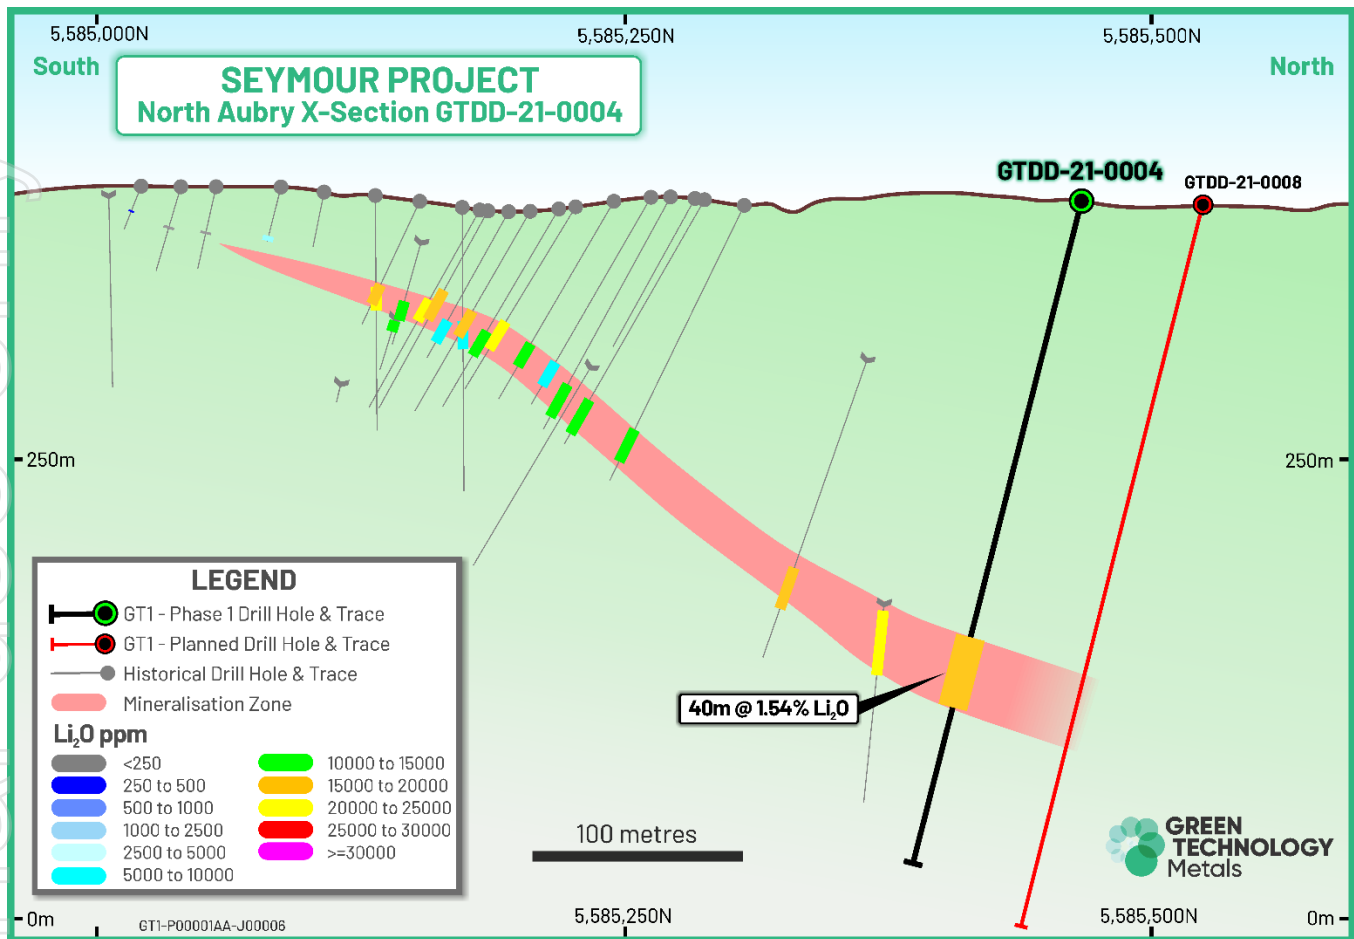

Chief Executive Officer, Luke Cox

- 1 See ASX:ADV announcement dated 6 March 2019, *Substantial Increase in Mineral Resources at Seymour Lake*.
- 2 The information in this release that relates to Exploration Results and Mineral Resources for the Ontario Lithium Projects was released in the Company's prospectus (see ASX:GT1 release dated 8 November 2021). The Company confirms that it is not aware of any new information or data that materially affects the information in that release and that the material assumptions and technical parameters underpinning these estimates continue to apply and have not materially changed.

## Green Technology Metals (ASX:GT1)

Green Technology Metals is a North American focussed lithium exploration and development business. The Company's Ontario Lithium Projects comprise three high-grade, hard-rock spodumene assets (Seymour, Root and Wisa) covering 95km<sup>2</sup> of highly prospective tenure north-west of Thunder Bay in Ontario, Canada.

All sites are proximate to excellent existing infrastructure (including hydro power generation and transmission facilities), readily accessible by road, and with nearby rail delivering transport optionality.

Seymour has an existing Mineral Resource estimate of 4.8 Mt @ 1.25% Li<sub>2</sub>O (comprised of 2.1 Mt at 1.29% Li<sub>2</sub>O Indicated and 2.7 Mt at 1.24% Li<sub>2</sub>O Inferred). Accelerated, targeted exploration across all three projects delivers outstanding potential to grow resources rapidly and substantially.

The information in this release that relates to Exploration Results, Mineral Resources and Exploration Targets for the Ontario Lithium Projects was released in the Company's prospectus (see GT1 ASX release dated 8 November 2021). The Company confirms that it is not aware of any new information or data that materially affects the information in that release and that the material assumptions and technical parameters underpinning these estimates continue to apply and have not materially changed.

The Exploration Target potential quantities and grades are conceptual in nature and there has been insufficient exploration to estimate a Mineral Resource. It is uncertain if further exploration will result in the estimation of a Mineral Resource. The Exploration Target is not being reported as part of any Mineral Resource.

The Company currently holds a 51% interest in the Projects under a joint venture with Ardiden Limited (ASX: 'ADV'). GT1 can acquire 80% interest in the Projects for the following consideration: A\$3.5 million cash and/or GT1 shares, 12-months post ASX listing. Please refer to the Company's Prospectus dated 16 September 2021 for further details.

## **Appendix A:**

### **Competent Person's Statements**

The information in this release that relates to Exploration Results and Exploration Targets at Seymour is based on activities carried out by Mr Luke Cox (Fellow AusIMM). Mr Cox has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and the activity they are undertaking to qualify as Competent Persons as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code 2012). Mr Cox consents to the inclusion in this release of the matters based on the information in the form and context in which it appears in this release. Mr Cox is the Chief Executive Officer of the Company and holds securities in the Company.

### **Forward Looking Statements**

Certain information in this document refers to the intentions of Green Technology Metals Limited (ASX: GT1), however these are not intended to be forecasts, forward looking statements or statements about the future matters for the purposes of the Corporations Act or any other applicable law. Statements regarding plans with respect to GT1's projects are forward looking statements and can generally be identified by the use of words such as 'project', 'foresee', 'plan', 'expect', 'aim', 'intend', 'anticipate', 'believe', 'estimate', 'may', 'should', 'will' or similar expressions. There can be no assurance that the GT1's plans for its projects will proceed as expected and there can be no assurance of future events which are subject to risk, uncertainties and other actions that may cause GT1's actual results, performance or achievements to differ from those referred to in this document. While the information contained in this document has been prepared in good faith, there can be given no assurance or guarantee that the occurrence of these events referred to in the document will occur as contemplated. Accordingly, to the maximum extent permitted by law, GT1 and any of its affiliates and their directors, officers, employees, agents and advisors disclaim any liability whether direct or indirect, express or limited, contractual, tortuous, statutory or otherwise, in respect of, the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and do not make any representation or warranty, express or implied, as to the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and disclaim all responsibility and liability for these forward-looking statements (including, without limitation, liability for negligence).

## Appendix B: JORC Code, 2012 Edition – Table 1 report

### Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul>	<b>Diamond Drilling</b> <ul style="list-style-type: none"> <li>Diamond drilling was used to obtain nominally 1m downhole samples of core.</li> <li>54 core samples were ½ cored using a diamond saw with ½ the core placed in numbered sample bags for assaying and the other half retained in sequence in the core tray.</li> <li>½ core samples were approximately 2.5kg in weight with a minimum weight of 500grams.</li> <li>Core was cut down the apex of the core and the same downhole side of the core selected for assaying to reduce potential sampling bias.</li> </ul>
<b>Drilling techniques</b>	<ul style="list-style-type: none"> <li>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</li> </ul>	<ul style="list-style-type: none"> <li>Tri-cone drilling was undertaken through the thin overburden prior to NQ2 diamond drilling through the primary rock.</li> </ul>
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<ul style="list-style-type: none"> <li>No core was recovered through the overburden tri-coned section of the hole (top 5m of the hole)</li> <li>Core recovery through the primary rock and mineralised pegmatite zones was over 98% and considered satisfactory.</li> <li>Recovery was determined by measuring the recovered metres in the core trays against the drillers core block depths for each run.</li> </ul>
<b>Logging</b>	<ul style="list-style-type: none"> <li>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</li> <li>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</li> <li>The total length and percentage of the relevant intersections logged.</li> </ul>	<ul style="list-style-type: none"> <li>Each sample was logged for lithology, minerals, grain size and texture as well as alteration, sulphide content, and any structures.</li> <li>Logging is qualitative in nature.</li> <li>Samples are representative of an interval or length.</li> <li>Sampling was undertaken for the entire cross strike length of the intersected pegmatite unit at nominal 1m intervals with breaks at geological contacts. Sampling extended into the country mafic rock.</li> </ul>
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>If core, whether cut or sawn and whether quarter, half or all core taken.</li> <li>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</li> <li>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</li> <li>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> <li>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field</li> </ul>	<ul style="list-style-type: none"> <li>Each ½ core sample was dried, crushed to entirety to 90% - 10 mesh, riffle split (up to 5 kg) and then pulverized with hardened steel (250 g sample to 95% -150 mesh) (includes cleaner sand).</li> <li>Blanks and Certified Reference samples were inserted in each batch submitted to the laboratory at a rate of approximately 1:20.</li> <li>Field duplicates were taken at a rate of 1:20 taken immediately adjacent to the original sample.</li> <li>The sample preparation process is considered representative of the whole core sample.</li> </ul>

Criteria	JORC Code explanation	Commentary
	<p>duplicate/second-half sampling.</p> <ul style="list-style-type: none"> <li>Whether sample sizes are appropriate to the grain size of the material being sampled.</li> </ul>	
<b>Quality of assay data and laboratory tests</b>	<ul style="list-style-type: none"> <li>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</li> <li>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</li> <li>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</li> </ul>	<ul style="list-style-type: none"> <li>Actlabs inserted internal standards, blanks and pulp duplicates within each sample batch as part of their own internal monitoring of quality control.</li> <li>All and blanks and certified reference samples returned acceptable results.</li> <li>The major element oxides and trace elements including Rb, Cs, Nb, Ta and Be were analyzed by FUS-ICP and FUS-MS (4Litho-Pegmatite Special) analytical codes which uses a lithium metaborate tetraborate fusion with analysis by ICP and ICPMS.</li> <li>Historic specific gravity testwork was determined for every 10th sample by RX17-GP analytical code measured on the pulp by a gas pycnometer.</li> </ul>
<b>Verification of sampling and assaying</b>	<ul style="list-style-type: none"> <li>The verification of significant intersections by either independent or alternative company personnel.</li> <li>The use of twinned holes.</li> <li>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</li> <li>Discuss any adjustment to assay data.</li> </ul>	<ul style="list-style-type: none"> <li>NA</li> </ul>
<b>Location of data points</b>	<ul style="list-style-type: none"> <li>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>	<ul style="list-style-type: none"> <li>A GPS reading was taken for each sample location using UTM NAD83 Zone16 (for Seymour); waypoint averaging or dGPS was performed when possible.</li> <li>Ardiden undertook a Lidar survey of the Seymour area in 2018 (+/- 0.15m) which underpins the local topographic surface.</li> <li>Downhole survey data used a Digital Electronic Multi-shot (DEMS) camera for establishing hole orientation.</li> </ul>
<b>Data spacing and distribution</b>	<ul style="list-style-type: none"> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>Whether sample compositing has been applied.</li> </ul>	<ul style="list-style-type: none"> <li>The Seymour North Aubry pegmatites have variable drill spacing from 20Ex20Nm in the shallower areas (&lt;150m) of the deposit to 50mEx50mN at lower depths (150-250m)</li> <li>1m compositing was applied to the historic Seymour Mineral Resource.</li> </ul>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</li> <li>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</li> </ul>	<ul style="list-style-type: none"> <li>Drill samples were drilled close to perpendicular to the strike of the pegmatite unit and sampled the entire length of the pegmatite as well including several metres into the mafic country rock either side of the pegmatite.</li> </ul>
<b>Sample security</b>	<ul style="list-style-type: none"> <li>The measures taken to ensure sample security.</li> </ul>	<ul style="list-style-type: none"> <li>All core was supervised and secured in a locked vehicle, warehouse, or container until delivered to Actlabs in Thunder Bay for cutting, preparation and analysis.</li> </ul>

## Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites,</li> </ul>	<ul style="list-style-type: none"> <li>Joint Venture between Green Technology Metals (ASX:GT1) 51% and Ardiden Ltd (ASX:ADV) 49%.</li> <li>GT1 has the option to acquire 80% of the Ardiden Lithium Assets for consideration of \$3.5M in cash and/or GT1</li> </ul>

Criteria	JORC Code explanation	Commentary
	<p>wilderness or national park and environmental settings.</p> <ul style="list-style-type: none"> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<p>shares</p> <ul style="list-style-type: none"> <li>Seymour Lithium Asset consists of 265 Cell Claims (Exploration Licences) with a total claim area of 5,205 ha.</li> <li>All Cell Claims are in good standing</li> <li>An Active Exploration Permit exists over the Seymour Lithium Assets and is due for renewal February 2022</li> <li>Renewal is a simple on-line application process</li> <li>An Early Exploration Agreement is current with the Whitesand First Nation who are supportive of GT1 exploration activities.</li> </ul>
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>Regional exploration for lithium deposits commenced in the 1950's. In 1957, local prospector, Mr Nelson Aubry, discovered the North Aubry and the South Aubry pegmatites.</li> <li>Geological mapping by the Ontario Department of Mines commenced in 1959 and was completed in 1962 (Pye, 1968), with the publication of "Map 2100 Crescent Lake Area" in 1965.</li> <li>From the late 1950's to 2002, exploration by the Ontario Department of Mines was generally restricted to geological mapping and surface sampling, although some minor drilling was completed to test the North Aubry pegmatite in late 1957 (Rees, 2011).</li> <li>In 2001, Linear Resources Inc. ("Linear Resources") obtained the Seymour Lake Project with an initial focus on the project's tantalum potential. In 2002, a 23-diamond drill-hole campaign was completed at North Aubry, and a further 8 diamond drill-holes at South Aubry.</li> <li>In 2008, Linear Resources completed a regional soil-sampling program which resulted in the identification of a number soil geochemical anomalies. Based on these anomalies, another drilling campaign (completed in 2009), with 12 diamond drill-holes at North Aubry, 2 diamond drill-holes at South Aubry, and further 5 diamond drill-holes peripheral to the Aubry prospects designed to test the main 2008 soil geochemical anomalies.</li> <li>Little work was undertaken between 2010 and 2016 until Ardiffen acquired the project from Linear Resources in 2016. Further drilling was carried out by Ardiffen between 2017 and 2018 resulting in the completion of an updated mineral resource estimate of the Aubry pegmatites in 2018. Ground Penetrating Radar (GPR) was also undertaken by Ardiffen in 2018 to test any further exploration potential beyond the current Aubry pegmatite delineating numerous targets.</li> </ul>
<b>Geology</b>	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li><b>Regional Geology:</b> The general geological setting of the Seymour Lithium Asset consists of the Precambrian Canadian Shield that underlies approximately 60% of Ontario. The Shield can be divided into three major geological and physiographic regions, from the oldest in the northwest to the youngest in the southeast.</li> <li><b>Local Geology:</b> The Seymour Lithium Asset is located within the eastern part of the Wabigoon Subprovince, near the boundary with the English River Subprovince to the north. These subprovinces are part of the Superior Craton, comprised mainly of Archaean rocks but also containing some Mesoproterozoic rocks such as the Nipigon Diabase.</li> <li><b>Bedrock Geology:</b> The bedrock is best exposed along the flanks of steep-sided valleys scoured by glaciers during the recent ice ages. The exposed bedrock is commonly metamorphosed basaltic rock, of which some varieties have well-preserved pillows that have been intensely flattened in areas of high tectonic strain. Intercalated between layers of basalt are lesser amounts of schists derived from sedimentary rocks and lesser rocks having felsic volcanic protoliths. These rocks are typical of the</li> </ul>

Criteria	JORC Code explanation	Commentary														
		<p>Wabigoon Subprovince, host to most of the pegmatites in the region.</p> <ul style="list-style-type: none"><li><b>Ore Geology:</b> Pegmatites are reasonably common in the region intruding the enclosing host rocks after metamorphism, evident from the manner in which the pegmatites cut across the well developed foliation within the metamorphosed host rocks. This post-dating relationship is supported by radiometric dating; an age of 2666 ± 6 Ma is given for the timing of intrusion of the pegmatites (Breaks, et al., 2006).</li></ul>														
<b>Drill hole Information</b>	<ul style="list-style-type: none"><li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:<ul style="list-style-type: none"><li>easting and northing of the drill hole collar</li><li>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li><li>dip and azimuth of the hole</li><li>down hole length and interception depth</li><li>hole length.</li></ul></li><li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li></ul>	<ul style="list-style-type: none"><li>The original MRE for the Seymour Lake Project area was undertaken by Ardiden in February 2019. Ardiden commissioned an independent consultant, Mr Phil Jones (MAusIMM [ #105653 ] / MAIG [ #1903 ]) to produce the MRE as a competent person as defined by the JORC Code (JORC., 2012).</li><li>Mr Phil Jones subsequently agreed to act as the Competent Person for the current MRE for the Seymour Lake Project under the 51% owner Green Technology Metals.</li><li>A total of 185 diamond holes, on a nominal 20m x 20m grid, have been drilled and used in the resource modelling at North Aubry and South Aubry. A total of 130 holes were drilled by Ardiden, with the previous owners Linear drilling 44 holes</li><li>The 2018 Ardiden drilling was completed by Rugged Aviation Inc. using BTW coring equipment producing 4.20 cm diameter core.</li><li>The earlier drill holes were either vertical or inclined towards the west. Once the pegmatite was determined to be dipping towards the north-east, the later drill holes were inclined towards the south-west</li><li>Hole GTDD-21-0004 was drilled by Green Technology Metals Ltd from 8-15 December 2021 with the following collar coordinates:</li></ul> <table><tr><th>Hole</th><th>Easting</th><th>Northing</th><th>RL</th><th>Depth</th><th>Dip</th><th>Azimuth</th></tr><tr><td>GTDD-21-0004</td><td>397,233</td><td>5,585,466</td><td>390</td><td>331</td><td>-76</td><td>210</td></tr></table> <p>Coordinates in NAD83 Zone 16 Grid format</p>	Hole	Easting	Northing	RL	Depth	Dip	Azimuth	GTDD-21-0004	397,233	5,585,466	390	331	-76	210
