

## Intercept of 67.7m at 7.3 g/t gold confirms the Verde Zone as a continuous 1.5 kilometre zone of mineralisation

### Highlights

- Assays from the next series of Verde Zone drill holes which cover 1.5 kilometres strike return several significant intercepts confirming that the Verde Zone, at the Company's flagship Hualilan Gold Project, is a discovery of scale.
- Results include (refer Table 1):
  - 67.7m at 7.7 g/t AuEq<sup>2</sup> - 7.3 g/t Au, 5.7 g/t Ag, 0.6% Zn from 300.4m including 32.1m at 15.9 g/t AuEq<sup>2</sup> - 15.2 g/t Au, 10.9 g/t Ag, 1.2% Zn from 335.9m including; 0.5m at 834 g/t AuEq<sup>2</sup> - 833 g/t Au, 104 g/t Ag, from 335.9m and 1.4m at 24.4 g/t AuEq<sup>2</sup> - 21.0 g/t Au, 84.7 g/t Ag, 5.4% Zn from 362.9m (GNDD-458);
  - 51.0m at 1.5 g/t AuEq<sup>2</sup> - 0.9 g/t Au, 15.2 g/t Ag, 0.9% Zn from 141.0m including 4.6m at 14.3 g/t AuEq<sup>2</sup> - 8.3 g/t Au, 162.7 g/t Ag, 9.0% Zn from 187.4m and; 23.6m at 0.7 g/t AuEq<sup>2</sup> - 0.7 g/t Au, 0.9 g/t Ag, from 209.4m (GNDD-376);
  - 37.8m at 1.0 g/t AuEq<sup>2</sup> - 0.9 g/t Au, 2.0 g/t Ag, 0.2% Zn from 94.0m including 9.0m at 3.2 g/t AuEq<sup>2</sup> - 2.9 g/t Au, 4.9 g/t Ag, 0.5% Zn from 106.0 and; 26.0m at 0.6 g/t AuEq<sup>2</sup> - 0.6 g/t Au, 1.0 g/t Ag, 0.1% Zn from 50.0m (GNDD-439);
  - 26.6m at 2.2 g/t AuEq<sup>2</sup> - 2.2 g/t Au, 0.8 g/t Ag from 348.5m including; 4.2m at 12.7 g/t AuEq<sup>2</sup> - 12.6 g/t Au, 2.7 g/t Ag, from 356.8 (GNDD-437).
- The intercept of 67.7 metres at 7.7 g/t AuEq was from a 200 metre strike section of undrilled Verde Zone. Follow-up holes targeting strike and dip extensions are underway.
- In addition to wide zones of Verde style mineralisation drilling intercepted significant zones of high-grade mineralisation at depth with mineralisation remaining open at depth.
- Many holes continued to encounter multiple stacked zones of mineralisation and intersections of steeper and shallower dipping mineralised zones.

**Commenting on the results, CEL Managing Director, Mr Kris Knauer, said**

*"The results from the next series of Verde Zone drill holes have again significantly exceeded our expectations. The intercept of 67.7 metres at 7.3 g/t gold, 5.7 g/t silver and 0.6% zinc is world class. Especially given it comes from the middle of the undrilled section of the Verde Zone. We now have 2 of the 9 drill rigs on site following up this hole.*

*Additionally, as we drill deeper the results are confirming the presence of stacked zones of mineralisation at Verde and that we are intercepting higher-grade mineralisation at depth."*

**Challenger Exploration (ASX: CEL)** ("CEL" the "Company") is pleased to announce the results from 64 holes and three drill hole extensions from its Verde Zone extension drill program at the Company's flagship Hualilan Gold Project, in San Juan Argentina. A total of 65 of the 67 drill holes (97%) intersected significant gold mineralisation with 51 of 69 holes (74%) intersecting at least 10 grams x metres of AuEq mineralisation. This infill and extension drill program is ongoing with 4 of 9 drill rigs currently turning on the Verde Zone.

The results from the current drilling has again exceeded the Company's expectations and confirms:

- Verde is one continuous zone of mineralisation at least 1.5 kilometres long which is yet to be closed off at depth or along strike;
- multiple stacked zones and intersections of steeper and shallower dipping of mineralised zones in the majority of the Verde Zone holes;
- strong mineralisation in the final 200 metres of the 1.5 kilometres strike to be drilled with GNDD-458 intersecting **67.7m at 7.7 g/t AuEq**. The best hole drilled on the Verde Zone;
- Several zones of higher-grade mineralisation including **6.7m at 6.0 g/t AuEq** (GNDD-359) **4.8m at 8.8g/t AuEq** and **2.0m at 9.4 g/t AuEq** (GNDD-361), and **26.6m at 2.2 g/t AuEq** (GNDD-437).
- The deeper zones of higher-grade mineralisation will become increasingly important as Verde continues to extend at depth beyond the limits of what may be amenable within an open pit.

## THE VERDE ZONE

The Verde Zone is a recent discovery targeted using surface magnetics and IP (Induced Polarization) at the Hualilan Gold Project. The discovery hole (ASX release 2/3/21) returned 125.5 metres at 1.1 g/t AuEq including 71.0 metres at 1.8 g/t AuEq (GNDD-169). The Verde Zone covers 1.5 kilometres strike between the Magnata and Sanchez Faults and mineralisation remains open along strike and at depth.

Mineralisation in the Verde Zone is oriented north-south, is 50 to 100 metres wide, and is hosted by bedding parallel fault-fracture zones in sediments and steeply dipping fracture zones in intrusives. A lower grade halo of mineralisation extends into the overlying sedimentary rocks which have been locally brecciated by the hydrothermal fluids during mineralisation. The overlying mineralisation in the sedimentary rocks dips to the west at 30-50° and is up to 50 metres thick. This overlying halo of lower grade mineralisation is a useful exploration guide to vector to the deeper intrusion-hosted mineralisation.

## ONGOING VERDE ZONE DRILL PROGRAM

The infill and extension drilling at the Verde and Gap Zones is designed as a series of fences of holes at 40 to 80 metres spacing along strike. Holes on each fence were collared to target the mineralisation 40 to 80 metres below the previous hole.

The Company intends to drill the entire 1.5 kilometre Verde Zone down to 300 metres vertically on 40 metre spacing fences of drilling . This drilling has been designed to provide confidence to estimate Mineral Resources to indicated category.

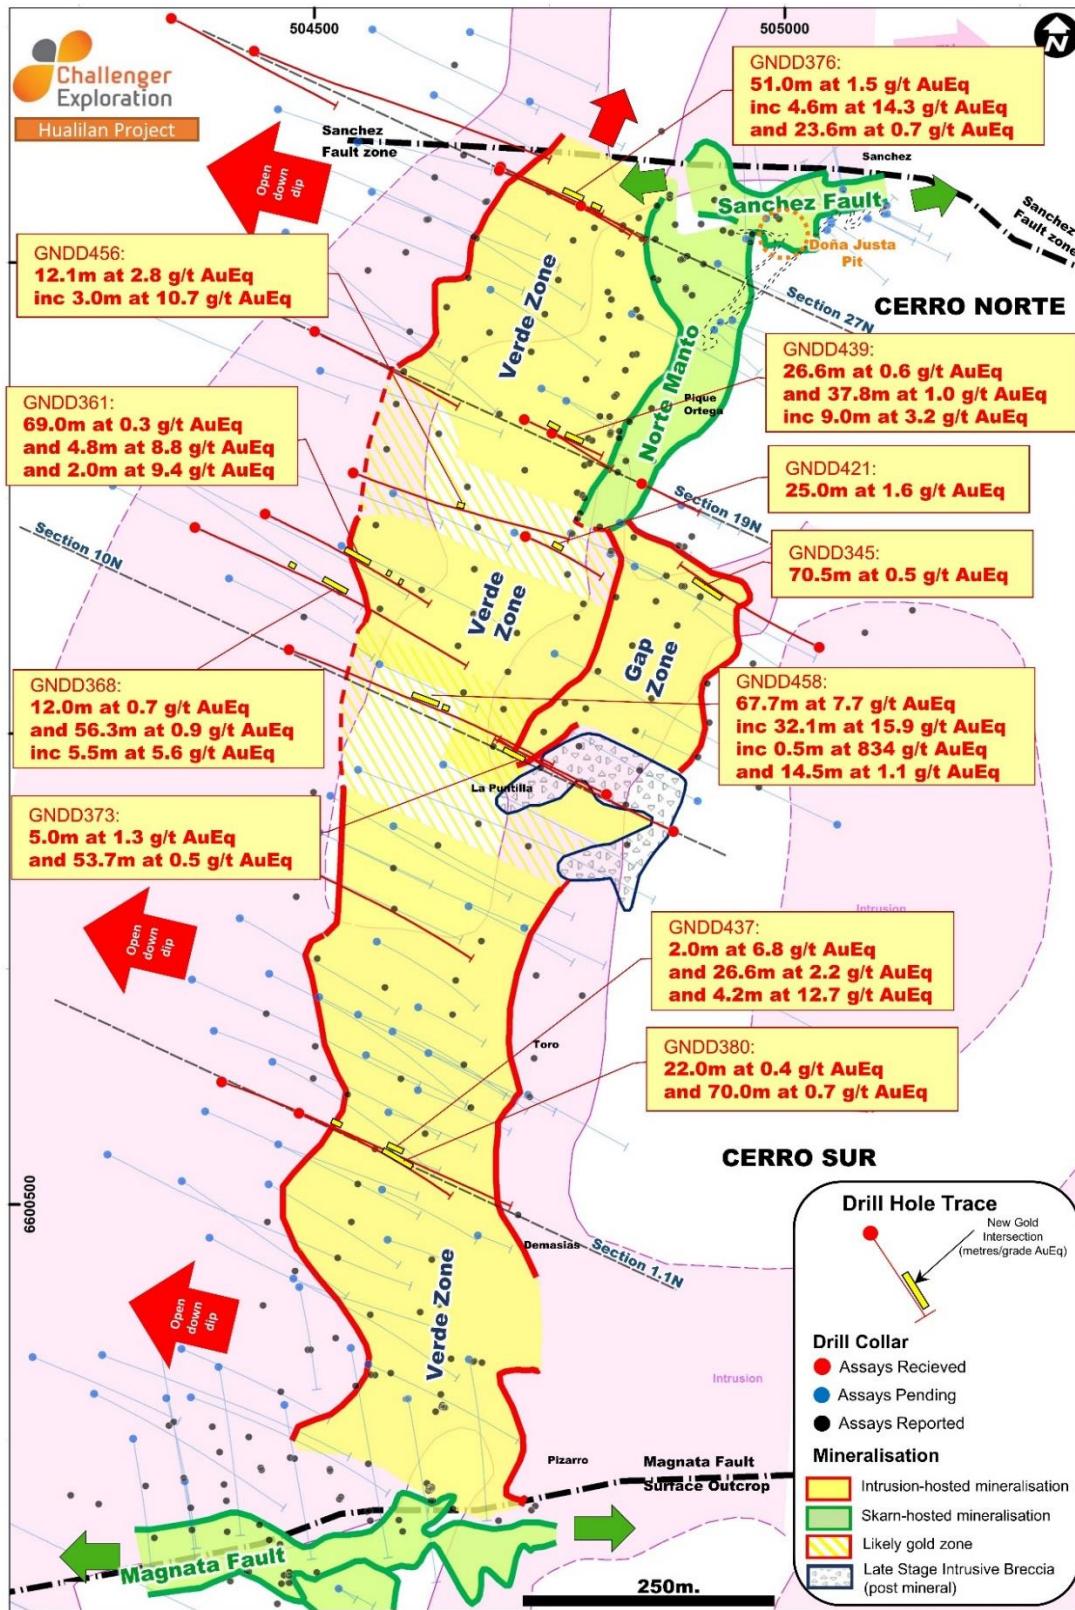

Figure 1 - Plan view showing Verde Zone Mineralisation (currently reported holes in red)

## DISCUSSION OF RESULTS

### Undrilled 200 metre section of the Verde Zone (GNDD-458, GNDD-426, GNDD-373, GNDD-381)

GNDD-458 and GNDD-426 were both collared in the undrilled portion of the Verde Zone between GNDD-308 in the south and GNDD-337 in the north. This 200 metres strike from GNDD-308 to the north is affected by a post mineral intrusive breccia believed to have diluted the mineralisation. Hence this 200 metre section of the Verde Zone was the last section to be drilled with the exception of GNDD-322. GNDD-322 was drilled at the reverse angle targeting the Gap Zone mineralisation and intersected 8.9 metres at 2.0 g/t AuEq near the end of the hole. This was interpreted as GNDD-322 drilling across the Gap Zone into another zone of mineralisation.

#### **GNDD458**

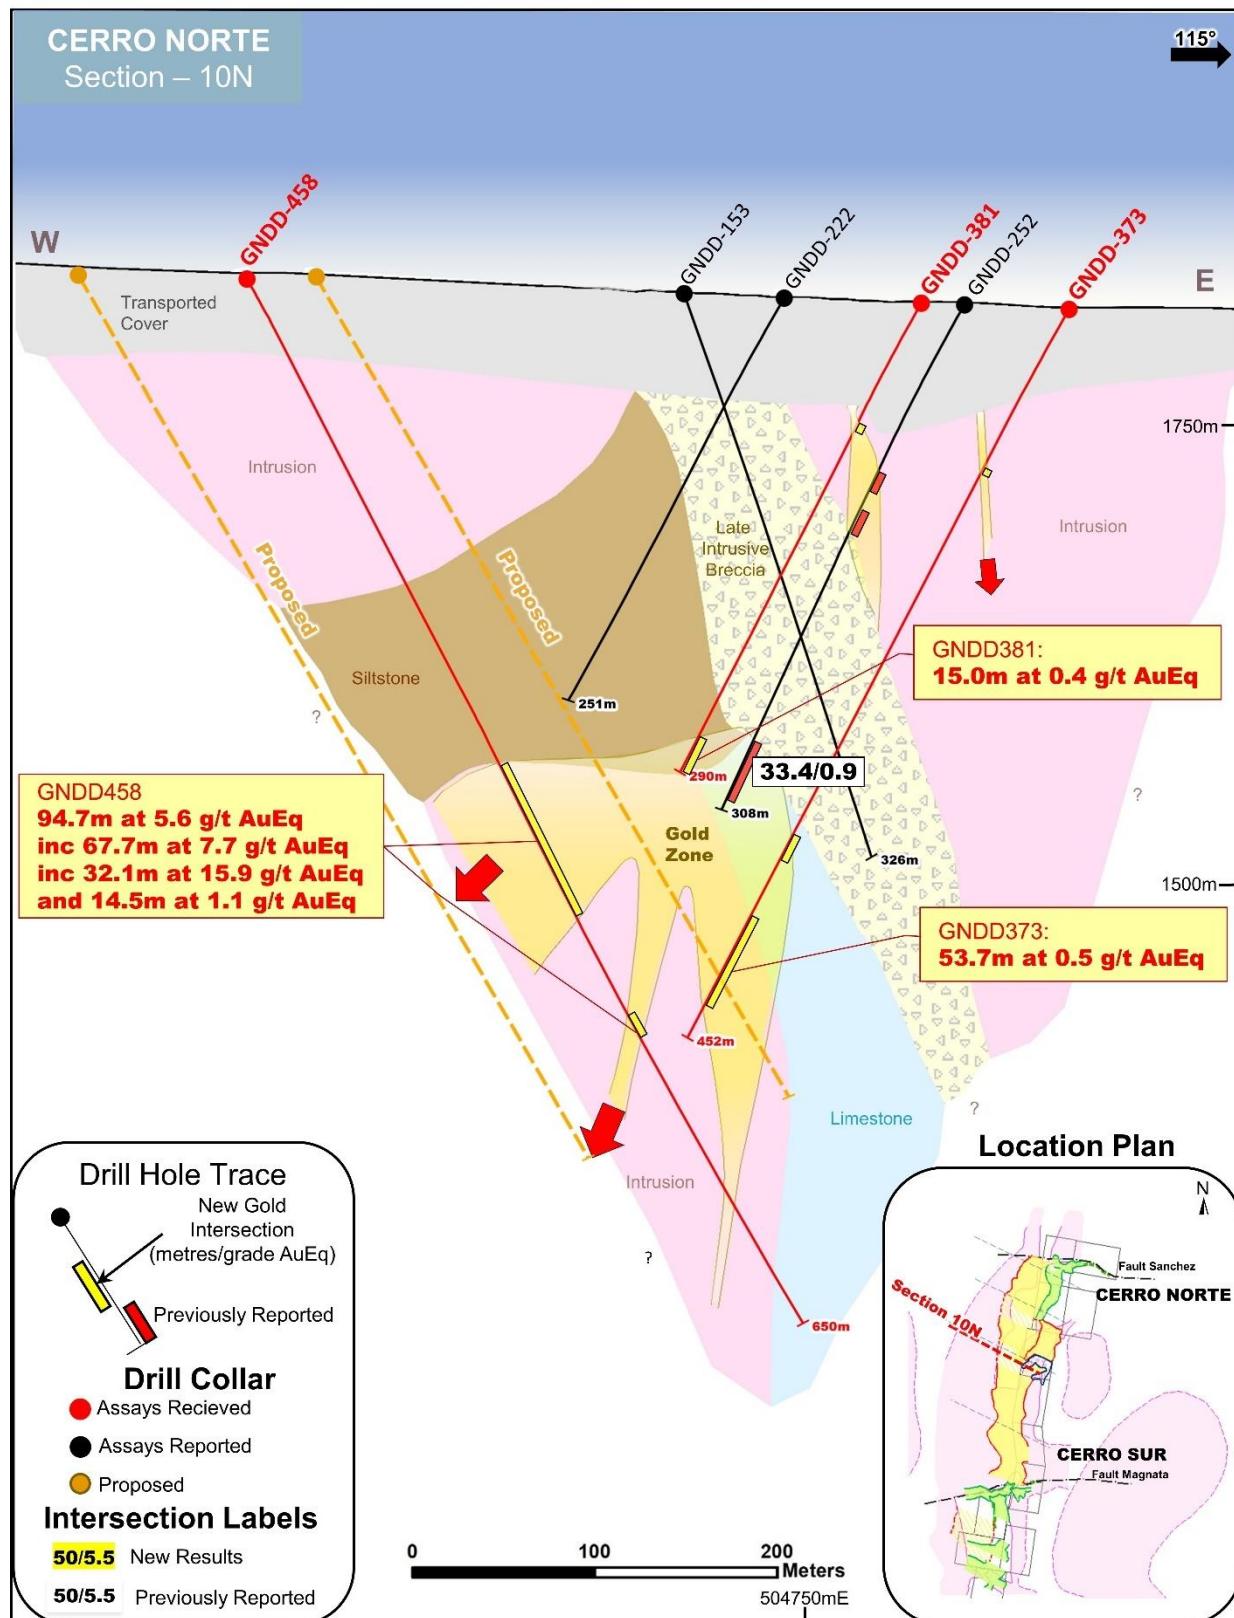

GNDD-458 was collared 40 metres south of GNDD-337 (13.0m at 2.4 g/t AuEq and 34.0m at 0.3 g/t AuEq) the previous southernmost hole drilled before the 200 metre zone. GNDD-458 intersected several stacked zones of mineralisation typical of the Verde Zone. This included the best intersection recorded in the Verde Zone of **67.7 metres at 7.7 g/t AuEq (7.3 g/t Au, 5.7 g/t Ag, 0.6% Zn)** from 300.4m including **32.1 metres at 15.9 g/t AuEq (15.2 g/t Au, 10.9 g/t Ag, 1.2% Zn)**. This included the highest individual sample gold assay recorded at the Hualilan Gold Project with **0.5 metres at 833 g/t Au and 104 g/t Ag**, from 335.9m and a second high-grade zone of **1.4 metres at 24.4 g/t AuEq (21.0 g/t Au, 84.7 g/t Ag, 5.4% Zn)** within the 67.7 metre intercept. GNDD-458 then intersected **14.45 metres at 1.1 g/t AuEq (0.94 g/t gold, 2.5 g/t silver, 1.1% zinc)** 12.5 metres below the main zone. Including the intervening 12.5 metres of internal dilution the two zones composite to **94.7 metres at 5.6 g/t AuEq**.

Additionally the hole intersected 17 metres of lower grade mineralisation in intrusives from 219.0m, a deeper zone of 11 metres of mineralised Intrusives from 458.0m, plus two deeper 1-2 metre zones of mineralisation. GNDD-458 extended the mineralisation intersected in GYDD-337 and GYDD-369, the previous southernmost holes drilled before the 200 metre undrilled zone, 40 metres south.

Additionally, as Figure 2 shows, the mineralisation intersected in GNDD-458 also correlates with near end of hole intersections in three holes drilled in the reverse orientation to test the Gap Zone mineralisation. The deeper intersection in earlier hole GNDD-252 (33.4 metres at 0.9 g/t AuEq including 2.9 metres at 5.8 g/t AuEq) is now interpreted as the upper part of the Verde Zone. As are the intersections near the end of the hole in GNDD-373 and GNDD-381. GNDD-373 intersected **53.7 metres at 0.5 g/t AuEq (0.5 g/t Au, 1.8 g/t Ag, 0.1% Zn)** from 376.0m hosted in intrusives. GNDD-381 intersected **14.0m at 0.4 g/t AuEq (0.3 g/t Au, 4.7 g/t Ag)** in sediments which is typical of the lower grade halo mineralisation seen above the main intrusion hosted Verde Zone.

#### **GNDD-426 and GNDD-364**

GNDD-426 was collared at the opposite end of the 200 metre undrilled hole section of the Verde Zone 40 metres north of GNDD-308 (36.8m at 0.6 g/t AuEq and 45.0m at 0.4 g/t AuEq) and GNDD-333 (21.0m at 0.6 g/t AuEq and 10.3 metres at 0.5 g/t AuEq and 13.0 metres at 0.4 g/t AuEq). GNDD-426 intersected **28.0 metres at 0.2 g/t AuEq** with the top 450 metres of GNDD-426 intersecting significant widths of the post mineral intrusive breccia. GNDD-364, collared 40 metres further south to test near

**Figure 2 - Cross Section showing GNDD-458 in the previously undrilled section of the Verde Zone**

surface up-dip of GNDD-308 and GNDD-333, was also completed in this round of drilling. The hole intersected **29 metres at 0.5 g/t AuEq (0.5 g/t gold, 0.4 g/t silver, 0.1% zinc)** from 83.0m including **2.0 metres at 2.4 g/t AuEq (2.4 g/t gold, 0.2 g/t silver)**, below 20 metres of the post mineral breccia and 63 metres of unconsolidated cover.

Given the results of GNDD-458, which demonstrate that the Verde Zone mineralisation appears to thicken, and the grade increase significantly, south into this 200 metre zone of no drilling the decision has been made to extend the resource drill out south across this 200 metre gap to GNDD-308. This drilling will be conducted on 40 metres spaced lines of drilling with deeper holes also planned to test down dip of GNDD-458 and GNDD-308.

### **Southern Verde Zone Drilling**

#### **GNDD-380, GNDD-437 GNDD-474**

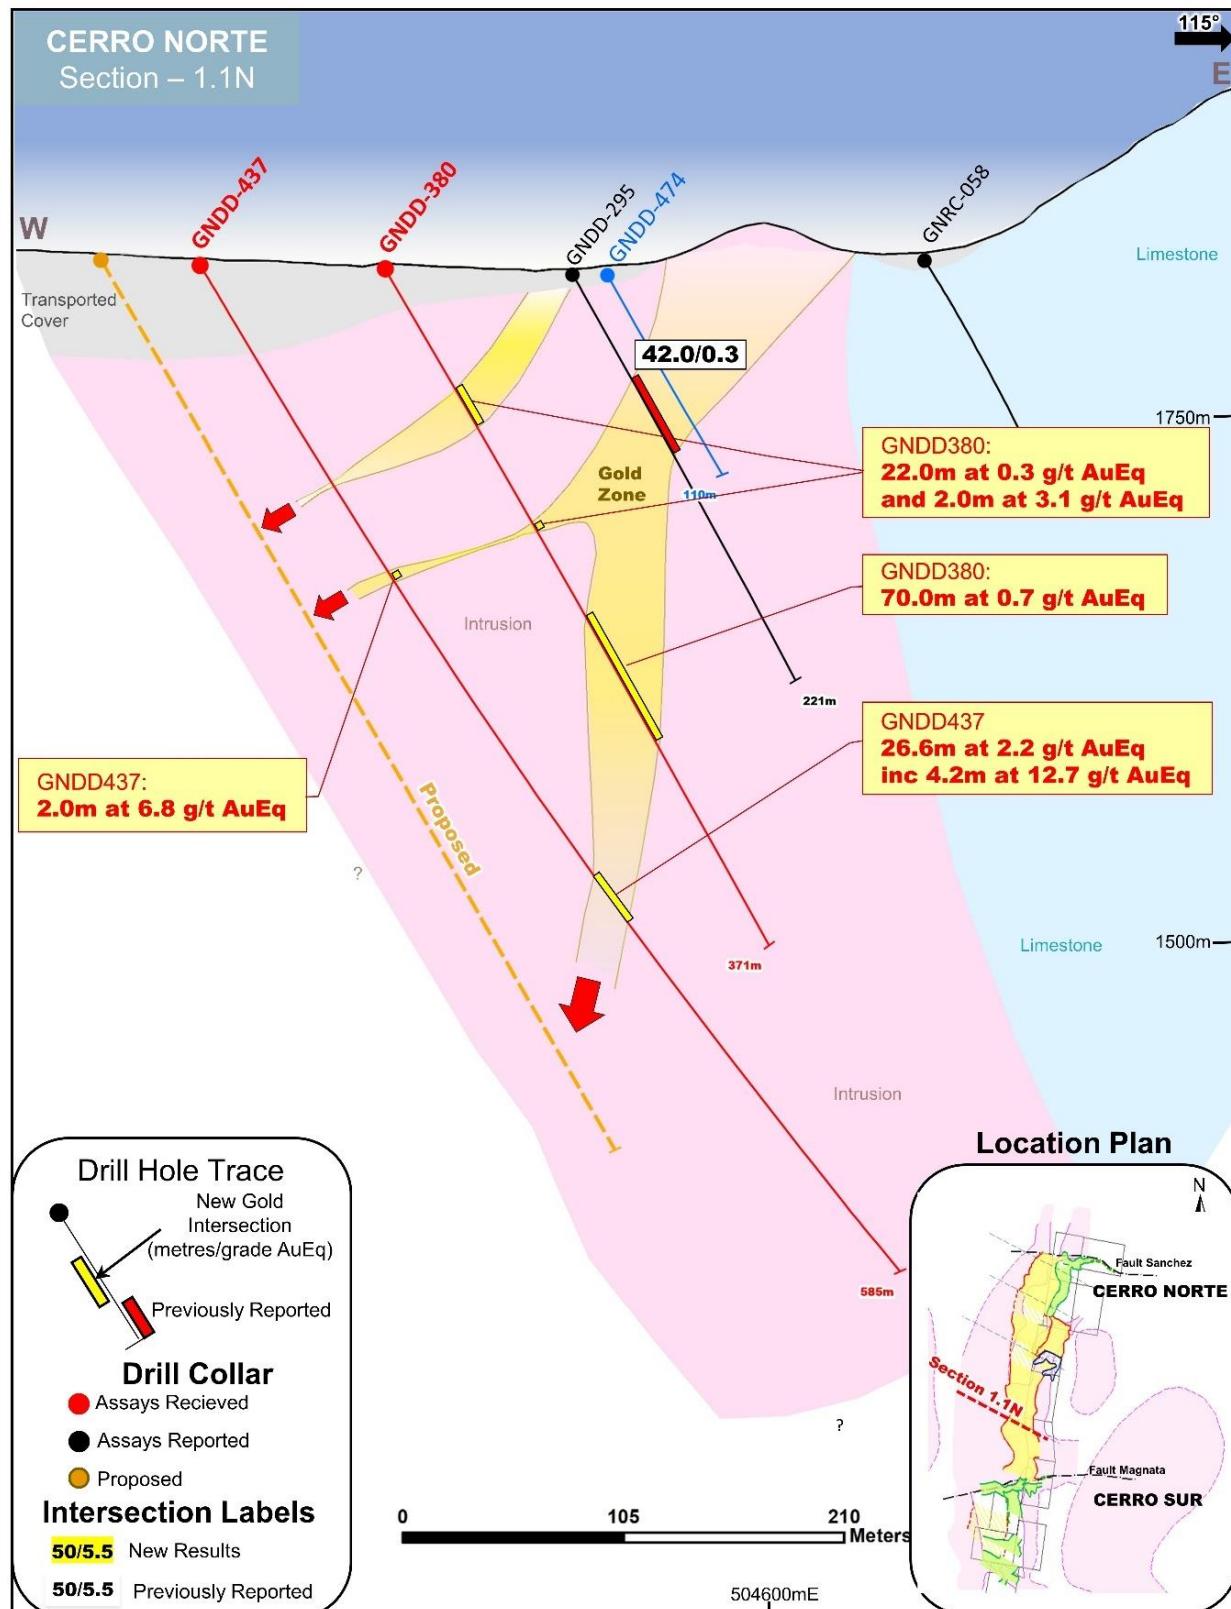

Figure 3 is a Cross Section showing drill holes GNDD-380, GNDD-437, and GNDD-476 (assays pending) from the southern end of the Verde Zone. These were a series of holes collared to test downdip and up-dip of GNDD-295 (42.0m at 0.3 g/t AuEq).

GNDD-380, collared to test 80 metres downdip of GNDD-295, intersected three zones of Verde mineralisation all hosted in intrusives including **22 metres at 0.4 g/t AuEq (0.3 g/t gold, 1.7 g/t silver, 0.1% zinc)** from 67.0m and **70 metres at 0.7 g/t AuEq (0.6 g/t gold, 1.0 g/t silver)** from 192.0m. This intercept included several higher grade zones such as **0.7 metres at 17.7 g/t AuEq (17.5 g/t gold, 17.6 g/t silver)** from 194.0m, **1.4 metres at 9.6 g/t AuEq (9.6 g/t gold, 3.5 g/t silver)** from 214.5m, and **2.0 metres at 4.5 g/t AuEq (4.5 g/t gold, 0.4 g/t silver)** from 257.0m. . A drill hole between GNDD-295 and GND-380 is being planned to target the intersection of the steeper and shallow dipping mineralized structures where, analogous to GNDD-458, higher grades are expected..

GNDD-437 extended the mineralisation another 80 metres downdip with an intersection of **26.6 metres at 2.2 g/t AuEq (2.2 g/t gold, 0.8 g/t silver)** from 348.5m and including higher grade intersections of **4.2 metres at 12.7 g/t AuEq (12.6 g/t gold, 2.0 g/t silver)** from 356.8m and **2.0 metres at 1.7 g/t AuEq (1.7 g/t gold, 0.4 g/t silver)** from 373.0m. In both GNDD-380 and 437 the higher grade zones were encountered at the top and bottom contacts of the mineralisation indicating these higher grade zones are likely to be structurally continuous between holes.

GNDD-437 also intersected two zones of mineralisation above the main Verde Zone (**1.7 metres at 1.8 g/t AuEq from 52.5m and 2.0 metres at 6.8 g/t AuEq from 173.0m**) which correlates with, and appears continuous with, the two shallower zones intersected in GNDD-380 80 metres up-dip.

A deeper hole is planned to test 80 metres downdip of GNDD-437 and GNDD-474 (assays pending) has been drilled up-dip of GNDD-295. GNDD-474 has been logged as intersecting 47.0 metres of altered intrusives from 36.0 metres containing disseminated pyrite and sphalerite which is typical of the bulk Verde Zone mineralisation intersected in nearby holes. Additionally, altered intrusives are mapped at surface in the southern end of the Verde Zone so it is likely the Verde Zone mineralisation extends to surface in the southern portion of the Verde Zone.

**Figure 3 - Cross Section showing GNDD-380 and GNDD-437 southern Verde Zone**

### **GNDD-412 and GNDD-453**

Other southern Verde Zone drill holes in this program included GNDD-412 and GNDD-453 on the next line of drilling 40 metres south of GNDD-380 and GNDD437. These two holes were drilled down-dip of GNDD-287 which intersected 126.0 metres at 0.5 g/t AuEq from near surface. Both holes intersected three zones of mineralisation as was intersected in GNDD-380 and GNDD-437 on the next fence of drilling. Results included **28 metres at 0.6 g/t AuEq (0.5 g/t gold, 6.0 g/t silver, 0.1% zinc)** from 132.0m and **27.5 metres at 0.4 g/t AuEq (0.3 g/t gold, 1.0 g/t silver)** from 256.5m in GNDD-412 and **8.7 metres at 1.2 g/t AuEq (1.0 g/t gold, 3.5 g/t silver, 0.4% zinc)** from 283.6m in GNDD-453.

### **Northern Verde Zone Drilling**

#### **GNDD-347, GNDD-355, GNDD-435 and GNDD-439**

Figure 4 shows drill holes GNDD347, GNDD-355, GNDD-435 and GNDD-439 from the current round of Verde Zone drilling. The section is typical of the northern Verde and Gap Zones showing the bedding parallel mineralisation dipping to the west and the Gap Zone dipping more steeply to the east.

GNDD-439 intersected **26 metres at 0.6 g/t AuEq (0.6 g/t gold, 1.0 g/t silver, 0.1% zinc)** from 50.5m and **37.8 metres at 1.0 g/t AuEq (0.9 g/t gold, 2.0 g/t silver, 0.2% zinc)** from 94.0m including **9.0 metres at 3.2 g/t AuEq (2.9 g/t gold, 4.9 g/t silver, 0.5% zinc)**. This extended the Verde Zone mineralisation to near surface (below transported cover) in this location. GNDD-347, collared to test approximately 200 metres down-dip, successfully extended the Verde Zone mineralisation to 250 metres intersecting **25.0 metres at 0.8 g/t AuEq (0.8 g/t gold, 0.4 g/t silver)** from 235.0m and a second zone of mineralisation from 277.0m downhole.

The drilling on this section successfully extended the Verde Zone mineralisation up-dip and down dip of earlier drill holes GNDD-173 (60m at 0.6 g/t AuEq) and GNDD-236 (52.0m at 1.2 g.t AuEq). Mineralisation on this section has now been defined from near surface, below transported cover, to 250 metres and remains open at depth. An infill hole is programmed between GNDD-236 and GNDD-173 with GNDD-490 (assays pending) collared to test another 80 metres down-dip of GNDD-347. Exploration is following the mineralisation down dip in search of the same structural setting encountered in GNDD-458. The intersection with steeper dipping zones feeding into the shallow dipping zone already intersected which generates zones of high-grade mineralisation.

### **GNDD-368**

GNDD-368, and subsequent extension GNDD-368e, was drilled as a downdip-test of GNDD-285 which intersected several stacked zones of mineralisation including 11.3 metres at 3.7 g/t AuEq and GNDD-280 which intersected 15.1 metres at 4.5 g/t AuEq. GNDD-368 intersected strong Verde Zone mineralisation 160 metres downdip from GNDD-285 with the hole intersecting four zones of mineralisation. Intercepts included **56.3metres at 0.9 g/t AuEq (0.8 g/t gold, 2.2 g/t silver, 0.1% zinc)** from 313.8m including **5.5 metres at 5.6 g/t AuEq (5.1 g/t gold, 13.7 g/t silver, 0.9% zinc)**.

An infill hole between GNDD-368 and GNDD-285 is planned as part of the current Verde Zone resource drilling and an exploration hole GNDD-487 (assays pending) has been drilled to test 80 metres downdip of GNDD-368.

**Figure 4 - Cross Section showing GNDD-439 and GNDD-347 (Northern Verde Zone)**

### **GNDD-350 and GNDD-361**

GNDD-361 and GNDD-350 were collared 40 metres north of GNDD-368 to infill this relatively lightly drilled section of the Verde Zone. The only other drilling on this section was GNDD-182 collared 200 metres east which intersected 4.3 metres at 36.6 g/t AuEq in a remnant section of skarn mineralisation within limestone.

GNDD-350 intersected **0.6 metres at 4.9 g/t AuEq (4.3 g/t gold, 8.7 g/t silver, 1.2% zinc)** from 273.0m while GNDD-361 downdip intersected almost 100 gram x metres of mineralisation in 6 stacked zones. This included an upper zone of **69.0 metres at 0.3 g/t AuEq (0.3 g/t gold, 0.7 g/t silver, 0.1% zinc)** from 207.0m including **1.0 metre at 4.2 g/t AuEq (3.7 g/t gold, 2.8 g/t silver, 1.2% zinc)** hosted in sediments, typical of the lower-grade halo mineralisation at the top of the Verde Zone. The hole then intersected several zones of higher-grade mineralisation hosted in interbedded limestones and intrusives. Intercepts included **4.8 metres at 8.8 g/t AuEq (7.2 g/t gold, 16.5 g/t silver, 3.2% zinc)** from 330.2m including **1.6 metres at 26.0 g/t AuEq (21.5 g/t gold, 42.9 g/t silver, 9.2% zinc)** and **2.0 metres at 9.4 g/t AuEq (7.3 g/t gold, 19.7 g/t silver, 4.4% zinc)** from 366.5m and **0.9 metres at 10.8 g/t AuEq (10.4 g/t gold, 14.7 g/t silver, 0.4% zinc)** from 379.4m.

Additional drilling between GNDD-182 and GNDD-350 will be required to determine if the two zones of high-grade mineralisation correlate. GNDD-482 (assays pending) has been collared as a deeper test 80 metres down-dip of GNDD-361.

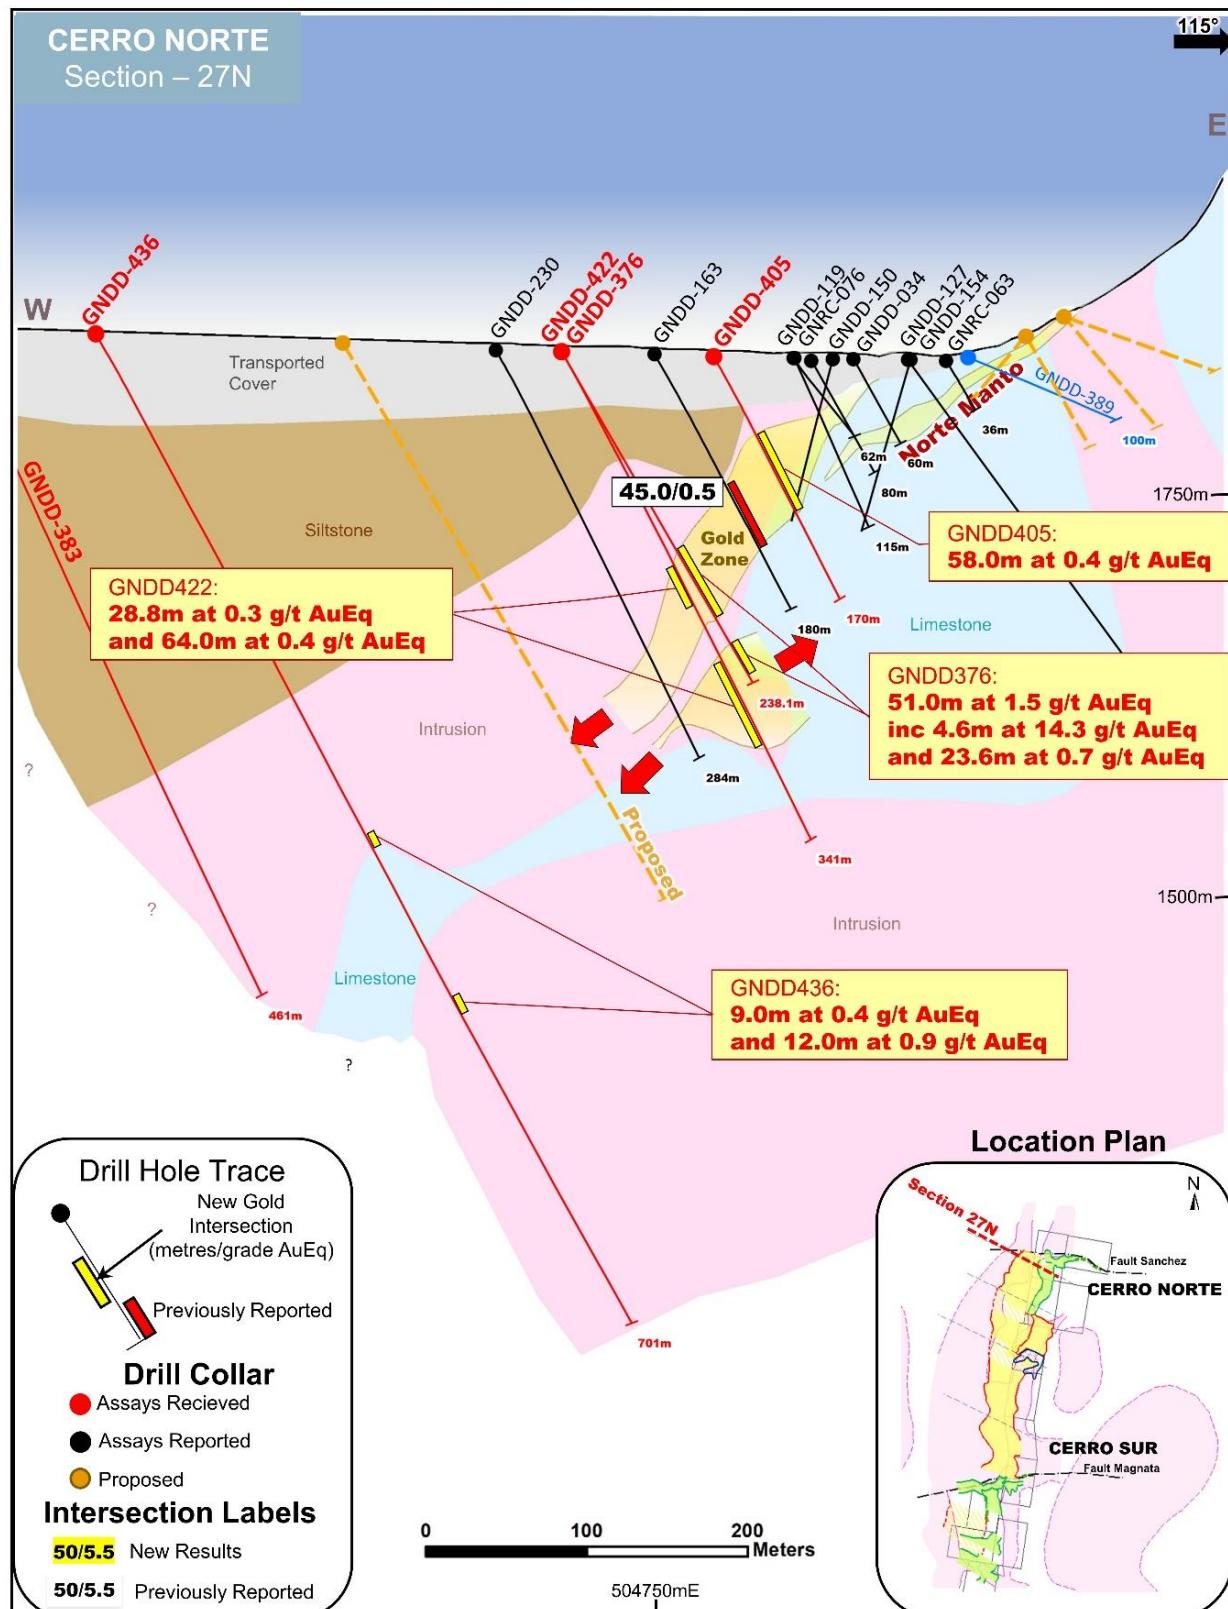

### **GNDD-376, GNDD-405, GNDD-422, GNDD-436**

Figure 5 is a cross section showing drillholes GNDD-376, GNDD-405 and GNDD-422. The holes were designed to test up-dip and downdip of drill hole GNDD-163 (45.0m at 0.5 g/t AuEq) which was one of the three Verde Zone discovery holes.

GNDD-376, collared to test between GNDD-230 and GNDD-163, intersected two broad zones of mineralisation with intercepts of **51.0 metres at 1.5 g/t AuEq (0.9 g/t gold, 15.2 g/t silver, 0.9% zinc)** from 141.0m including **4.6 metres at 14.3 g/t AuEq (8.3 g/t gold, 162.7 g/t silver, 9.0% zinc)** and **23.6 metres at 0.7 g/t AuEq (0.7 g/t gold, 0.9 g/t silver)** from 209.4. GNDD-405 was collared to extend the mineralisation 40 metres up-dip of GNDD-163 successfully extending the mineralisation to near surface intersecting **58.0 metres at 0.4 g/t AuEq (0.2 g/t gold, 2.9 g/t silver, 0.3% zinc)** from 58.0m.

GNDD-422 was designed to intersect the Verde zone 20 metres downdip of GNDD-376 after GNDD-376 was terminated before its targeted depth due to drilling problems. In addition to extending the two zones of mineralisation intersected in GNDD-376 and confirming mineralisation extended below GNDD-376 with intersections of **28.8 metres at 0.3 g/t AuEq** from 149.4m and **64.0 metres at 0.4 g/t AuEq** from 213.0m GNDD-422 also intersected a third zone of shallower mineralisation intersecting **8.5 metres at 0.5 g/t AuEq** from 122.0m.

The holes confirmed the presence of Verde Zone mineralisation from near surface to a depth of 400 metres. An additional hole is planned to test 40 metres down dip of GNDD-230 with any deeper drilling contingent on the results.

**Figure 5 - Cross Section showing northern Verde Zone drilling**

Drill hole GNDD-436 was drilled to test a feature on one of the lines of surface IP (Induced Polarisation) acquired by CEL. GNDD-436 intersected **9 metres at 0.4 g/t AuEq (0.2 g/t gold, 1.1 g/t silver, 0.4% zinc)** from 354.0m and **12 metres at 0.9 g/t AuEq (0.9 g/t gold, 0.3 g/t silver, 0.3% zinc)**. This is the downdip extension of the mineralisation intersected in GNDD-376, GNDD-424 and GNDD-405.

### **GNDD-372**

GNDD-372 collared on the next section south of GNDD-376 and GNDD-405 was a down dip test of GNDD-237 (59.0m at 1.0 g/t AuEq including 2.0 metres at 17.5 g/t AuEq). GNDD-372 confirmed the extension of higher-grade mineralisation another 80 metres down-dip intersecting **6.5 metres at 3.0 g/t AuEq (2.4 g/t gold, 3.5 g/t silver, 1.1% zinc)** from 290.5m including **1.5 metres at 11.2 g/t AuEq (9.0 g/t gold, 13.5 g/t silver, 4.7% zinc)**.

### **GNDD-366**

GNDD-366 was drilled as a down-dip test of GNDD-298 (21.0m at 0.8 g/t AuEq and 9.0m at 0.8 g/t AuEq) in a relatively lightly drilled section of the northern Verde Zone. GNDD-366 intersected **23.0 metres at 0.8 g/t AuEq (0.7 g/t gold, 0.6 g/t silver, 0.1% zinc)** from 290.5m including **2.0 metres at 3.0 g/t AuEq (3.0 g/t gold, 0.4 g/t silver)** and **5.7 metres at 3.7 g/t AuEq (3.6 g/t gold, 3.3 g/t silver)** from 335.4. GNDD-366 confirmed the presence of higher-grade mineralisation at depth in this area of the Verde Zone with GNDD-504 (assays pending) drilled to test 80 metres downdip of GNDD-366.

### **Extension of Verde Zone Mineralisation to near surface**

In addition to the up-dip drill holes detailed earlier in this ASX Release several drill holes successfully extended the Verde Zone mineralisation up-dip of earlier drilling to near surface. Notable holes are listed in the table below (*holes not included in earlier commentary in bold*). In the context of a potential open-pit exploitation scenario these significant widths of near surface mineralisation should significantly improve project economics.

Drill Hole (#)	From (m)	To (m)	Interval (m)	Gold (g/t)	Ag (g/t)	Zn (%)	AuEq (g/t)	Comments	Total (Gram)

Note - See Page 21 after Table 4 for information regarding AuEq's reported under the JORC Code.

### Zones of High Grade Mineralisation at depth

Several of the deeper drill holes at the Verde Zone intersected high-grade mineralisation at depths greater than 200 metres downhole. Notable holes are listed in the table below (*holes not included in earlier commentary in bold*).

Drill Hole (#)	From (m)	To (m)	Interval (m)	Gold (g/t)	Ag (g/t)	Zn (%)	AuEq (g/t)	Comments	Total (Gram)

**Table 3 - Summary of near surface intercepts reported**

Note - See Page 21 after Table 4 for information regarding AuEq's reported under the JORC Code.

Several of these holes intersected high-grade mineralisation down dip of earlier drilling that produced predominantly wide lower-grade intercepts. For example GNDD-437 intercepted **26.6m at 2.2 g/t AuEq** from 348.5m including **4.2 metres at 12.7 g/t AuEq** down-dip of GNDD-380 (70 metres at 0.7 g/t AuEq from 192.0m). GNDD-456 intercepted **12.4 metres at 2.8 g/t AuEq (1.6 g/t gold, 26.7 g/t silver, 2.1% zinc)** from 252.0m including **3.0 metres at 10.7 g/t AuEq (5.7 g/t gold, 108.2 g/t silver, 8.3% zinc)** downdip of GNDD-369 (also reported in this release) which intercepted 18.5 metres at 0.8 g/t AuEq from 226.0m including 5.4 metres at 1.7 g/t AuEq.

This transition into narrower zones of higher-grade mineralisation, often with a similar total **gram x metre** value to the lower grade mineralisation up-dip, is important as drilling on much of Verde approaches a depth of 300 metres vertically. At this depth exploitation via open pit mining may give way to a switch to underground mining at a higher-grade cut-off grade. Hence it is more likely that mineralisation at depth will need to be higher grade to form part of a Mineral Resource estimate.

Note - cut off of 1.0 g/t AuEq used unless otherwise stated

See below for information regarding AuEq's reported under the JORC Code.

#### **<sup>2</sup> Gold Equivalent (AuEq) values - Requirements under the JORC Code**

- Assumed commodity prices for the calculation of AuEq is Au US\$1780 Oz, Ag US\$24 Oz, Zn US\$2,800 /t
- Metallurgical recoveries for Au, Ag and Zn are estimated to be 89%, 84% and 79% respectively (see **JORC Table 1 Section 3 Metallurgical assumptions**) based on metallurgical test work.
- The formula used: AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1780) x (0.84/0.89)] + [Zn (%) x (28.00\*31.1/1780) x (0.79/0.89)]
- **CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.**

## About Challenger Exploration

### About Challenger Exploration

Challenger Exploration Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America. The strategy for the 100% owned Hualilan Gold project is for it to provide a high-grade low capex operation in the near term. This underpins CEL with a low risk, high margin source of cashflow while it prepares for a much larger bulk gold operation at both Hualilan and El Guaybo in Ecuador.

The Company is fully funded for the next 2 years with cash at bank of \$27.5 million and it has committed to a 9-rig 120,000 metre drill program at its Flagship Hualilan Gold project.

1. **Hualilan Gold Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive historical drilling with over 150 drill-holes and a non-JORC historical resource <sup>(1)</sup> of 627,000 Oz @ 13.7 g/t gold which remains open in most directions. The project was locked up in a dispute for the past 15 years and as a consequence had seen no modern exploration until CEL acquired the project in 2019. In the past 2 years CEL has completed 495 drill holes for more than 130,000 metres of drilling. Results have included **6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 6.7m @ 14.3 g/t Au, 140 g/t Ag, 7.3% Zn and 10.3m @ 10.4 g/t Au, 28 g/t Ag, 4.6% Zn**. This drilling intersected high-grade gold over almost 2 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including **209.0m at 1.0 g/t Au, 1.4 g/t Ag, 0.1% Zn and 110.5m at 2.5 g/t Au, 7.4 g/t Au, 0.90% Zn** in intrusives. CEL's current program which is fully funded will take metres drilled by CEL to 204,000 metres, and include metallurgical test work of key ore types, and an initial JORC Compliant Resource and PFS.
2. **El Guayabo Gold/Copper Project** covers 35 sq kms in southern Ecuador and was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling has demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including **156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t Ag** which have never been followed up. The Project has multiple targets including breccia hosted mineralisation, an extensive flat lying late-stage vein system and an underlying porphyry system target neither of which has been drill tested. CEL's first results confirm the discovery of large-scale gold system with over 250 metres of bulk gold mineralisation encountered in drill hole ZK-02 which contains a significant high-grade core of 134m at 1.0 g/t gold and 4.1 g/t silver including 63m at 1.6 g/t gold and 5.1 g/t silver. .

## Foreign Resource Estimate Hualilan Project

^ Source: La Mancha Resources Toronto Stock Exchange Release dated 14 May 2003 -Independent Report on Gold Resource Estimate.  
Rounding errors may be present. Troy ounces (oz) tabled here

#1 For details of the foreign non-JORC compliant resource and to ensure compliance with LR 5.12 please refer to the Company's ASX Release dated 25 February 2019. These estimates are foreign estimates and not reported in accordance with the JORC Code. A competent person has not done sufficient work to clarify the foreign estimates as a mineral resource in accordance with the JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimate will be able to be reported as a mineral resource. The company is not in possession of any new information or data relating to the foreign estimates that materially impact on the reliability of the estimates that materially impacts on the reliability of the estimates or CEL's ability to verify the foreign estimates estimate as minimal resources in accordance with Appendix 5A (JORC Code). The company confirms that the supporting information provided in the initial market announcement on February 25, 2019 continues to apply and is not materially changed.

### Competent Person Statement – Exploration results

The information that relates to sampling techniques and data, exploration results and geological interpretation has been compiled Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

### Competent Person Statement – Foreign Resource Estimate

The information in this release provided under ASX Listing Rules 5.12.2 to 5.12.7 is an accurate representation of the available data and studies for the material mining project. The information that relates to Mineral Resources has been compiled by Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration to qualify as Competent Person as defined in the 2012 Edition of the JORC Code for Reporting of, Mineral Resources and Ore Reserves. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

## JORC Code, 2012 Edition – Table 1 report template

### Section 1 Sampling Techniques and Data -Hualilan Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
<b>Sampling techniques</b>	<ul style="list-style-type: none"><li>- <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></li><li>- <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i></li><li>- <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i></li><li>- <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></li></ul>	<p>For historic exploration data, there is little information provided by previous explorers to detail sampling techniques. Drill core was cut with a diamond saw longitudinally and one half submitted for assay. Assay was generally done for Au. In some drill campaigns, Ag and Zn were also analysed. There is limited multielement data available. No information is available for RC drill techniques and sampling.</p> <p>For CEL drilling, diamond core (HQ3) was cut longitudinally on site using a diamond saw. Samples lengths are from 0.5m to 2.0m in length (average 1m), taken according to lithology, alteration, and mineralization contacts.</p> <p>For CEL reverse circulation (RC) drilling, 2-4 kg sub-samples from each 1m drilled are collected from a face sample recovery cyclone mounted on the drill machine.</p> <p>CEL channel samples are cut into underground or surface outcrop using a hand-held diamond edged cutting tool. Parallel saw cuts 3-5cm apart are cut 2-4cm deep into the rock which allows for the extraction of a representative sample using hammer and chisel. The sample is collected onto a plastic mat and collected into a sample bag.</p> <p>Core and channel samples were crushed to approximately 85% passing 2mm. A 500g or a 1 kg sub-sample was taken and pulverized to 85% passing 75µm. A 50g charge was analysed for Au by fire assay with AA determination. Where the fire assay grade is &gt; 10 g/t gold, a 50g charge was analysed for Au by Fire assay with gravimetric determination.</p> <p>A 10g charge was analysed for at least 48 elements by 4-acid digest and ICP-MS determination. Elements determined were Ag, As, Ba, Be, Bi, Ca, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr.</p> <p>Ag &gt; 100 g/t, Zn, Pb and Cu &gt; 10,000 ppm and S &gt; 10% were re-analysed by the same method using a different calibration.</p> <p>Sample intervals were selected according to geological boundaries. There was no coarse or visible gold observed in any of the core or channel samples.</p>

CEL drilling of HQ3 core (triple tube) was done using various truck and track mounted drill machines that are operated by various Argentinian drilling companies based in Mendoza and San Juan. The core has not been oriented as the rock is commonly too broken to allow accurate core orientation.

CEL drilling of reverse circulation (RC) drill holes was done using a track-mounted LM650 universal drill rig set up for reverse circulation drilling. Drilling is being done using a 5.25 inch hammer bit.

Collar details for DD drill holes and RC drill holes completed by CEL are shown below in WGS84, zone 19s projection. Collar locations for drill holes are surveyed using DGPS. Interim collar locations are surveyed with a handheld GPS to be followed up with DGPS when the hole is completed.

Hole_id	East (m)	North (m)	Elevation (m)	Dip (°)	Azimuth (°)	Depth (m)

Criteria	JORC Code explanation	Commentary						
<b>Drill sample recovery</b>	<ul style="list-style-type: none"> <li>- Method of recording and assessing core and chip sample recoveries and results assessed.</li> <li>- Measures taken to maximise sample recovery and ensure representative nature of the samples.</li> <li>- Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</li> </ul>	<p>Drill core is placed into wooden boxes by the drillers and depth marks are indicated on wooden blocks at the end of each run. These depths are reconciled by CEL geologists when measuring core recovery.</p> <p>Triple tube drilling has been being done by CEL to maximise core recovery.</p> <p>RC sub-samples are collected from a rotary splitter mounted to the face sample recovery cyclone. A 2-4 kg sub-samples is collected for each metre of RC drilling. Duplicate samples are taken at the rate of 1 every 25-30 samples using a riffle splitter to split out a 2-4 kg sub-sample. The whole sample recovered is weighed to measure sample recovery and consistency in sampling.</p> <p>A possible relationship has been observed between historic sample recovery and Au Ag or Zn grade whereby low recoveries have resulted in underreporting of grade. Insufficient information is not yet available to more accurately quantify this. Core recovery is influenced by the intensity of natural fracturing in the rock. A positive correlation between recovery and RQD has been observed. The fracturing is generally post mineral and not directly associated with the mineralisation.</p>						
<b>Logging</b>	<ul style="list-style-type: none"> <li>- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation mining studies and metallurgical studies.</li> <li>- Whether logging is qualitative or quantitative in nature. Core (or costean channel etc) photography.</li> <li>- The total length and percentage of the relevant intersections logged.</li> </ul>	<p>Detailed logs are available for most of the historical drilling. Some logs have not been recovered. No core photographs from the historic drilling have been found. No drill core has survived due to poor storage and neglect. No RC sample chips have been found.</p> <p>For CEL drilling, all the core is logged for recovery, RQD, weathering, lithology, alteration, mineralization, and structure to a level that is suitable for geological modelling resource estimation and metallurgical test work. RC drill chips are logged for geology, alteration and mineralisation to a level that is suitable for geological modelling resource estimation and metallurgical test work. Where possible logging is quantitative. Geological logging is done in MS Excel in a format that can readily be transferred to a database which holds all drilling logging sample and assay data.</p>						
<b>Sub-sampling techniques and sample preparation</b>	<ul style="list-style-type: none"> <li>- If core whether cut or sawn and whether quarter half or all core taken.</li> <li>- If non-core whether riffled tube sampled rotary split etc and whether sampled wet or dry.</li> <li>- For all sample types the nature quality and appropriateness of the sample preparation technique.</li> <li>- Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</li> </ul>	<p>Competent drill core is cut longitudinally using a diamond saw for sampling of ½ the core. Soft core is split using a wide blade chisel or a manual core split press. The geologist logging the core indicates on the drill core where the saw cut is to be made to ensure half-core sample representivity.</p> <p>Sample intervals are selected based on lithology alteration and mineralization boundaries. Sample lengths average 1.38m. No second-half core samples have been submitted. The second half of the core samples has been retained in the core trays for future reference.</p> <p>From hole GNDD073, duplicate diamond core samples have been collected for every 25-30m drilled. The duplicate diamond core samples are ¼ core samples. Duplicate core sample results and correlation plots (log scale for Au, Ag and Zn) are shown below:</p> <table style="width: 100%; text-align: center;"> <tr> <td style="width: 15%;">n</td> <td style="width: 15%;">RSQ</td> <td style="width: 15%;">mean</td> <td style="width: 15%;">median</td> <td style="width: 15%;">variance</td> <td style="width: 15%;"></td> </tr> </table>	n	RSQ	mean	median	variance

Criteria	JORC Code explanation	Commentary
		(CRM) with known values for Au Ag Pb Cu and Zn have been submitted with samples of drill core to test the precision and accuracy of the analytic procedures and determination of the MSA laboratory in Canada. Two of the standards were only used 4 times each and the third . 26 reference analyses were analysed in the samples submitted in 2019. For CRM 1 one sample returned an Au value > 2 standard deviations (SD) above the certified value. For CRM 2 one sample returned an Au value < 2SD below the certified value. For CRM 3 (graphs below) one sample returned a Cu value > 2SD above the certified value. All other analyses are within 2SD of the expected value. The standards demonstrate suitable precision and accuracy of the analytic process. No systematic bias is observed.
		For drill holes from GNDD011 and unsampled intervals from the 2019 drilling, 18 different Certified Standard Reference pulp samples (CRM) with known values for Au Ag Fe S Pb Cu and Zn and 7 different CRM's with known values for Au only have been submitted with samples of drill core to test the precision and accuracy of the analytic procedures of the MSA and ALS laboratories. In the results received to date there has been no observed bias in results of the CRM. The standards demonstrate suitable precision and accuracy of the analytic process. No systematic bias is observed. A summary of the standard deviations from the expected values for CRM's used is summarised below. Generally, an average of standard deviations close to zero indicates a high degree of accuracy and a low range of standard deviations with a low fail count indicates a high degree of precision.
		37 standard (CRM) sample assays submitted with the channel samples have been finalised. The results are consistent with CRM submitted with drill core samples.

Criteria	JORC Code explanation	Commentary
<b>Location of data points</b>	<ul style="list-style-type: none"> <li>- Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys) trenches mine workings and other locations used in Mineral Resource estimation.</li> <li>- Specification of the grid system used.</li> <li>- Quality and adequacy of topographic control.</li> </ul>	<p>Assay results summarised in the context of this report have been rounded appropriately to 2 significant figures. No assay data have been otherwise adjusted.</p> <p>Following completion of drilling collars are surveyed using a differential GPS (DGPS) relative into the Argentinian SGM survey. The locations have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.</p> <p>Following completion of the channel sampling, the location of the channel samples taken underground is surveyed from a survey mark at the entrance to the underground which is located using differential GPS. The locations have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.</p> <p>The drill machine is set-up on the drill pad using hand-held equipment according to the proposed hole design.</p> <p>Diamond core drill holes are surveyed at 30-40m intervals down hole using a Reflex tool. RC drill holes are surveyed down hole every 10 metres using a gyroscope to avoid magnetic influence from the drill rods.</p> <p>All current and previous drill collar sites, Minas corner pegs and strategic surface points have been surveyed using DGPS to provide topographic control for the Project.</p>
<b>Data spacing and distribution</b>	<ul style="list-style-type: none"> <li>- Data spacing for reporting of Exploration Results.</li> <li>- Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</li> <li>- Whether sample compositing has been applied.</li> </ul>	<p>No regular drill hole spacing has been applied across the Project, although a nominal 40m x 40m drill spacing is being applied to infill and extension drilling where appropriate. The current drilling is designed to check previous exploration, extend mineralisation along strike, and provide some information to establish controls on mineralization and exploration potential. No Mineral Resource Estimate to JORC 2012 reporting standards has been made at this time.</p> <p>Samples have not been composited.</p>
<b>Orientation of data in relation to geological structure</b>	<ul style="list-style-type: none"> <li>- Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known considering the deposit type.</li> <li>- If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias this</li> </ul>	<p>As far as is currently understood and where practicable, the orientation of sampling achieves unbiased sampling of structures and geology controlling the mineralisation.</p> <p>For underground channel sampling, the orientation of the sample is determined by the orientation of the workings. Where the sampling is parallel with the strike of the mineralisation, plans showing the location of the sampling relative to the orientation of the mineralisation, weighted average grades and estimates of true thickness are provided to provide a balanced report of the mineralisation that has been sampled.</p> <p>Drilling has been designed to provide an unbiased sample of the geology and mineralisation targeted.</p>

Criteria	JORC Code explanation	Commentary																																																																																				
		<ul style="list-style-type: none"> <li>- 2003 – 2005 – La Mancha (TSE Listed) undertook 7447m of DDH core drilling (HD-01 to HD-48)</li> <li>- Detailed resource estimation studies were undertaken by EPROM Ltda. (EPROM) in 1996 and CMEC (1999 revised 2000) both of which were written to professional standards and La Mancha 2003 and 2006.</li> <li>- The collection of all exploration data by the various operators was of a high standard and had appropriate sampling techniques intervals and custody procedures were used.</li> </ul>																																																																																				
<b>Geology</b>	<ul style="list-style-type: none"> <li>- Deposit type geological setting and style of mineralisation.</li> </ul>	<p>Mineralisation occurs in all rock types where it preferentially replaces limestone, shale and sandstone and occurs in fault zones and in fracture networks within dacitic intrusions.</p> <p>The mineralisation has previously been classified as a Zn-Cu distal skarn (or manto-style skarn) with vein-hosted Au-Ag mineralisation. It has been divided into three phases – prograde skarn retrograde skarn and a late quartz-galena event the evolution of the hydrothermal system and mineral paragenesis is the subject of more detailed geometallurgical work.</p> <p>Gold occurs in native form and as inclusions with sulphide and pyroxene. The mineralisation also commonly contains pyrite, chalcopyrite sphalerite and galena with rare arsenopyrite, pyrrhotite and magnetite.</p> <p>Mineralisation is either parallel to bedding in bedding-parallel faults, in veins or breccia matrix within fractured dacitic intrusions, at lithology contacts or in east-west striking steeply dipping siliceous faults that cross the bedding at a high angle. The faults have thicknesses of 1–4 m and contain abundant sulphides. The intersection between the bedding-parallel mineralisation and east-striking cross veins seems to be important in localising the mineralisation.</p>																																																																																				
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</li> <li>- easting and northing of the drill hole collar</li> <li>- elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</li> <li>- dip and azimuth of the hole</li> <li>- down hole length and interception depth</li> <li>- hole length.</li> <li>- If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the</li> </ul>	<p>The following significant intersections have been reported by previous explorers. A cut-off grade of 1 g/t Au equivalent has been used with up to 2m of internal dilution or a cut-off grade of 0.2 g/t Au equivalent and up to 4m of internal dilution has been allowed. No metallurgical or recovery factors have been used. 		(1) cut off 10 g/t Au equivalent (2) cut off 0.2 g/t Au equivalent									
		NSI: no significant intersection									
<b>Data aggregation methods</b>	<ul style="list-style-type: none"> <li>- In reporting Exploration Results weighting averaging techniques maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</li> <li>- Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>- The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul>	<p>Weighted average significant intercepts are reported to a gold grade equivalent (AuEq). Results are reported to cut-off grade of a 1.0 g/t Au equivalent and 10 g/t Au equivalent allowing for up to 2m of internal dilution between samples above the cut-off grade and 0.2 g/t Au equivalent allowing up to 10m of internal dilution between samples above the cut-off grade. The following metals and metal prices have been used to report gold grade equivalent: Au US\$ 1780 / oz Ag US\$24 /oz and Zn US\$ 2800 /t.</p> <p>Metallurgical recoveries for Au, Ag and Zn have been estimated from metallurgical test work completed by SGS Metallurgical Operations in Lakefield, Ontario using a combination of gravity and flotation of a combined metallurgical sample from 5 drill holes. Using data from the test results, and for the purposes of the AuEq calculation gold recovery is estimated at 89%, silver at 84% and zinc at 79%. Accordingly, the formula used is AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1780) x (0.84/0.89)] + [Zn (%) x (28.00*31.1/1780) x (0.79/0.89)]. Metallurgical test work and geological and petrographic descriptions suggest all the elements included in the metal equivalents calculation have a reasonable potential of eventual economic recovery. While Cu and Pb are reported in the table above, these metals are not used in the Au equivalent calculation at this early stage of the Project.</p> <p>No top cuts have been applied to the reported grades.</p>									
<b>Relationship between mineralisation widths and intercept lengths</b>	<ul style="list-style-type: none"> <li>- These relationships are particularly important in the reporting of Exploration Results.</li> <li>- If the geometry of the mineralisation with respect to the drill hole angle is known its nature should be reported.</li> <li>- If it is not known and only the down hole lengths are reported there should be a clear statement to this effect (eg 'down hole length true width not known').</li> </ul>	<p>The mineralisation is moderately or steeply dipping and strikes NNE and ENE. For some drill holes, there is insufficient information to confidently establish the true width of the mineralized intersections at this stage of the exploration program.</p> <p>Apparent widths may be thicker in the case where bedding-parallel mineralisation may intersect ENE-striking cross faults and veins.</p> <p>Representative cross section interpretations have been provided with release of significant intersections to allow estimation of true widths from individual drill intercepts.</p>

### Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<b>Database integrity</b>	<ul style="list-style-type: none"> <li>- Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection and its use for Mineral Resource estimation purposes.</li> <li>- Data validation procedures used.</li> </ul>	<p>Geological logging completed by previous explorers was done on paper copies and transcribed into the drill hole database. The data was checked for errors. Checks can be made against the original logs and core photographs.</p> <p>Assay data is received in digital format. Backup copies are kept and the data is copied into the drill hole database.</p> <p>The drill hole data is backed up and is updated periodically by a Company GIS and data team.</p>
<b>Site visits</b>	<ul style="list-style-type: none"> <li>- Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</li> <li>- If no site visits have been undertaken indicate why this is the case.</li> </ul>	<p>Site visits have been undertaken from 3 to 16 October 2019 15 to 30 November 2019 and 1-19 February 2020. The performance of the drilling program collection of data and sampling procedures were initiated during these visits.</p>
<b>Geological interpretation</b>	<ul style="list-style-type: none"> <li>- Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit.</li> <li>- Nature of the data used and of any assumptions made.</li> <li>- The effect if any of alternative interpretations on Mineral Resource estimation.</li> <li>- The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>- The factors affecting continuity both of grade and geology.</li> </ul>	<p>The interpretation is considered appropriate given the stage of the project and the nature of activities that have been conducted. The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the findings from the initial underground sampling activities.</p> <p>The most recent resource calculation (2006 and 2003 – La Mancha) used all core drilling at the time and detailed underground channel sampling collected by EPROM CMEC and La Mancha. Overlying assumptions included a reduction of the calculated grade in each resource block by a factor of 10% to account for possible errors in the analyses and samples. An arbitrary reduction factor was applied to the 2006 resource whereby the net reported tonnage was reduced by 25% for indicated resource blocks 50% for inferred resource blocks and 75% of potential mineral resource blocks. The reason for the application of these tonnage reduction factors was not outlined in the resource report. It is noted that at the time of this report La Mancha was in a legal dispute concerning the project with its joint venture partner and given the acquisition of a 200000 Oz per annum producing portfolio the project was likely no longer a core asset for La Mancha at that time. Additionally, under the original acquisition agreement La Mancha had to issue additional acquisition shares based on resource targets.</p> <p>The effect of removing the assumptions relating to application of the arbitrary tonnage reduction factors applied increases the overall resource tonnage by in excess of 50%. Removing these correction factors would bring the overall tonnage and grade close the earlier (2003 1999 and 1996) tonnage and grade estimates albeit in different categories (lower confidence) which are considered more appropriate.</p> <p>The mineralisation is defined to the skarn and vein bodies detailed cross section and plan maps were prepared for these bodies with their shapes used in controlling the resource estimate.</p>

Criteria	JORC Code explanation	Commentary
		The structure of the area is complex and a detailed structural interpretation is recommended as this may provide a better understanding of the continuity of mineralisation and possible extensions to it. The deposit contains bonanza gold values and while very limited twinning has indicated acceptable repeatability a rigorous study of grade continuity needs to be undertaken as part of future resource calculations.
<b>Dimensions</b>	<ul style="list-style-type: none"> <li>- <i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise) plan width and depth below surface to the upper and lower limits of the Mineral Resource.</i></li> </ul>	For the historic resource no reliable information has been provided to the owner however through further ongoing investigation is being conducted by the owner to address this information gap.
<b>Estimation and modelling techniques</b>	<ul style="list-style-type: none"> <li>- <i>The nature and appropriateness of the estimation technique(s) applied and key assumptions including treatment of extreme grade values domaining interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i></li> <li>- <i>The availability of check estimates previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i></li> <li>- <i>The assumptions made regarding recovery of by-products.</i></li> <li>- <i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i></li> <li>- <i>In the case of block model interpolation the block size in relation to the average sample spacing and the search employed.</i></li> <li>- <i>Any assumptions behind modelling of selective mining units.</i></li> <li>- <i>Any assumptions about correlation between variables.</i></li> </ul>	<p>The historic resource estimation techniques are considered appropriate. The 2003 and 2006 resources used a longitudinal section polygonal method was used for estimating resources with individual blocs representing weighted averages of sampled underground and/or areas of diamond drill pierce points with zones of influence halfway to adjacent holes. The area of the block was calculated in AutoCad directly from the longitudinal sections.</p> <p>Check assaying by PG Consulting returned values in the check assay sample which were 3.4% and 13% greater for Au and Ag than the original assays. A number pf previous resource estimates were available to check the 2006 resource estimate when the arbitrary tonnage reduction factors are removed brings the overall tonnage and grade close the earlier (2003 1999 and 1996) tonnage and grade estimates albeit indifferent categories which are considered more appropriate.</p> <p>It was assumed only gold silver and zinc would be recovered and that no other by products would be recovered. This is viewed as conservative given metallurgical data pointing to the production of a saleable zinc concentrate.</p> <p>Based on the preliminary metallurgy estimation of deleterious elements or other non-grade variables of economic significance was not required.</p> <p>The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.</p> <p>No assumptions were made regarding correlation between variables.</p> <p>The mineralisation is defined within skarn and associated vein deposits. Detailed cross section and plan maps were prepared for these domains with their shapes used in controlling the resource estimate. Long sections of the veins and skarn were taken and sampling was plotted and the blocks outlined considering this.</p>

Criteria	JORC Code explanation	Commentary
	<p><i>this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.</i></p>	<ul style="list-style-type: none"> <li>- Knelson concentrate tests with floatation of tailings were also completed. Applying a joint process Knelson concentrator and floatation of the tailings of the concentrator it is found that the global recovery is approximately 80% for gold.</li> <li>- While the testwork was focused predominantly on gold recovery some rougher flotation testwork was undertaken targeting Zn recovery producing up to 85% recoveries. In sulphide samples this produced a Zn concentrate containing 42% Zn with grades in excess of 50% Zn in concentrate expected with additional floatation stages.</li> <li>- The report concluded that it was possible to produce a commercial Au-Ag concentrate and a Zn concentrate.</li> <li>- Extraction of gold and silver by cyanidation was tested on 3/8 and ¼ inch (9.525mm and 19.05mm) crush sizes that are designed to test a heap leach processing scenario. Bottle roll of these crush size resulted in 41-39% gold recovery and 31-32% silver recovery with high cyanide consumption. No tests have been done on material at a finer grind size.</li> </ul> <p>More recently, CEL has completed initial metallurgical test work on a 147 kg composite sample of mineralised limestone drill core from GMDD039, GMDD040, GMDD041, GNDD043, GNDD003 and GNDD018 and a 55 kg composite sample of mineralised intrusion (dacite) drill core from GNDD113, GNDD113A, GNDD155 and GNDD157. The of skarn mineralisation in limestone that has a weighted average grade of 10.4 g/t Au, 31.7 g/t Ag, 3.2 % Zn, 0.15 % Cu and 0.46 % Pb. The sample of mineralised dacite has a weighted average grade of 1.1 g/t Au, 7.0 g/t Ag and 0.1 % Zn. Separate tests on 2 kg sub-samples were done with differing grinding times, Knelson and Mosley table gravity separation techniques and floatation techniques to provide a series of gravity and floatation concentrates. Key results are:</p> <ul style="list-style-type: none"> <li>- Combined gravity and floatation concentration process resulted in recoveries 85-95% for Au, 82-87% for silver and 77-80% for zinc. Cu had similar recoveries to Ag and Pb had similar recoveries to Zn.</li> <li>- A simple gravity separation followed by a sulfide floatation process when re-combined produced a single product with a median grade of 47 g/t Au, 120 g/t Ag and 13% Zn with a recovered weight of 24-33% of the sample weight.</li> <li>- Tailings fragment analysis indicates a grind of (<math>p_{80}</math>) 72-106 µm. Generally, a coarser grind resulted in a higher % weight recovered to the concentrate with a corresponding lower grade without significantly impacting recovery.</li> <li>- QEMSCAN analysis of the sample indicates much of the Zn not recovered is due to the presence of Zn oxide (franklinite) and silicates (hemimorphite).</li> <li>- Sulphides present are dominated by pyrite and sphalerite. Also present are chalcopyrite, pyrrhotite, chalcocite, bornite and galena.</li> <li>- Further test work is planned.</li> </ul>

Criteria	JORC Code explanation	Commentary
<b>Environmental factors or assumptions</b>	<ul style="list-style-type: none"> <li>- Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</li> </ul>	<p>It is considered that there are no significant environmental factors which would prevent the eventual extraction of gold from the project. Environmental surveys and assessments will form a part of future pre-feasibility.</p>
<b>Bulk density</b>	<ul style="list-style-type: none"> <li>- Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples.</li> <li>- The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit.</li> <li>- Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</li> </ul>	<p>Densities of 2.7 t/m<sup>3</sup> were used for mineralised veins and 2.6 t/m<sup>3</sup> for wall rock.</p> <p>No data of how densities were determined is available.</p> <p>The bulk densities used in the evaluation process are viewed as appropriate at this stage of the Project.</p> <p>CEL is collecting specific gravity measurements from drill core, which it is expected will be able to be used to estimate the block and bulk densities in future resource estimates.</p> <p>For RC drilling, the weights of material recovered from the drill hole is also able to be used as a measure of the bulk density.</p>
<b>Classification</b>	<ul style="list-style-type: none"> <li>- The basis for the classification of the Mineral Resources into varying confidence categories.</li> <li>- Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity and distribution of the data).</li> </ul>	<p>The Mineral Resource Estimate has both Indicated and Inferred Mineral Resource classifications under the National Instrument 43-101 code and is considered foreign. These classifications are considered appropriate given the confidence that can be gained from the existing data and results from drilling.</p> <p>The reliability of input data for the 2003 and 2006 resources is acceptable as is the confidence in continuity of geology and metal values quality quantity and distribution of the data. Appropriate account has been taken of all relevant factors with the exception of studies into the appropriateness of the application of a top cut.</p>

		Inferred	213,952	11.7	46.6	2.3
<b>Audits or reviews</b>	- <i>The results of any audits or reviews of Mineral Resource estimates.</i>	<p>The historic resource estimate has not been audited.</p> <p>The earlier (1996 and 2000) Mineral Resource Estimates were audited and re-stated in a 2003 resource report. This independent report was done to NI-43-101 standard and the results of this report were released to the TSX. This report concluded that "Detailed resource calculations made by three different groups are seen to be realistic.</p>				
<b>Discussion of relative accuracy/confidence</b>	<ul style="list-style-type: none"> <li>- <i>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</i></li> <li>- <i>The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</i></li> <li>- <i>These statements of relative accuracy and confidence of the estimate should be compared with production data where available.</i></li> </ul>	<p>There is sufficient confidence in the data quality drilling methods and analytical results that they can be relied upon. The available geology and assay data correlate well. The approach or procedure are deemed appropriate given the confidence limits. The main two factors which could affect relative accuracy is grade continuity and top cut.</p> <p>Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date and closer spaced drilling is required to improve the understanding of the grade continuity in both strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha are encouraging in terms of grade repeatability.</p> <p>The deposit contains very high grades and there is a potential need for the use of a top cut. It is noted that an arbitrary grade reduction factor of 10% has already been applied to the resource as reported.</p> <p>No production data is available for comparison</p>
