

Widgie grows Mt Edwards Nickel Resource

Widgie Nickel Limited (ASX: WIN, "Widgie" or "the Company") is pleased to provide the following update with respect to its flagship Mt Edwards project.

Highlights

- Widgie adds well-positioned Inco-Boundary deposit to Mt Edwards' Mineral Resource
- Inco-Boundary contains an Inferred Resource of 464,000t at 1.2% Ni for 5,590t of contained Ni (@ 1% Ni cutoff)
- Total Mt Edwards Project Mineral Resources now stands at 10,684kt at 1.6% Ni for 168,150t of contained Ni

Widgie Nickel Managing Director Steve Norregaard said:

"It's very pleasing to see Widgie continue to bolster the Mineral Resource base of Mt Edwards.

"Critically, Inco-Boundary is located proximal to other resources in the heart of the Mt Edwards project, making it a highly promising addition to our flagship project, as we move towards being production ready.

"The significance of Inco Boundary may well come to the fore in the medium term given the substantial increase in endowment noted when considering a lower cut-off grade with the resource swelling in size to 2.79Mt @ 0.84% Ni at a 0.5% Ni cut-off, in excess of 23,000t of contained nickel. With the higher nickel price outlook and potential for downstream processing increasing payability cut- off grades on all of the Mt Edwards resources may well be able to be reduced."

Inco-Boundary Resource

Following an independent assessment of the Inco-Boundary deposit by Auralia Mining Consulting, this new body of nickel mineralisation has been added to the Mt Edwards resource base.

Modelling of historical reverse circulation (RC) and diamond drilling (DD) carried out at the deposit has resulted in an Inferred resource at the Inco-Boundary deposit of 464,000 tonnes, at a grade of 1.2% nickel, representing 5,590 tonnes of contained nickel.

This increases the Total Resource across Mt Edwards to 10,684,000 tonnes, at 1.6% Ni, for contained nickel of 168,150 tonnes, encompassing both indicated and inferred resources at a 1% cut-off.

The full resource table follows.

| | Indicated | | Inferr | Inferred | | TOTAL | |
|--------------------|------------|---------------|---------------|---------------|------------|---------------|------------------|

Table 1: Mt Edwards Project Mineral Resource Estimate

*Mineral Resource estimates have been rounded to nearest 1,000t, 0.1% Ni and 10t of metal

Location

The Inco-Boundary deposit is proximal to existing resources on mining leases M15/103 and M15/87 (Figure 1). Striking north-south it is situated 500 metres south of the historic Mt Edwards/26N underground nickel mine and 900m north of the Munda Resource (at surface).

Mining Lease M15/103 is held by Mincor Resources Ltd, with Widgie Nickel's wholly-owned subsidiary Mt Edwards Lithium Pty Ltd retaining nickel rights over the tenement. Mining Lease M15/87 is held by Widgie Gold Pty Ltd, a whollyowned subsidiary of Auric Mining Ltd, with Mt Edwards Lithium Pty Ltd retaining nickel and lithium rights over this tenement.

Figure 1 - Location of the Inco-Boundary deposit.

Exploration History

The Inco-Boundary deposit was discovered by Inco Limited in November 1967, following programs of airborne and ground electromagnetic surveys, Induced Polarisation (IP) surveys and soil sampling. Over the ensuing two years, eight separate nickel sulphide occurrences were identified in the area, of which 26N Mt Edwards was the most significant. Inco-Boundary, previously referred to as the 14N prospect, was one of the nickel sulphide occurrences identified.

Subsequent exploration was conducted by Western Mining Corporation (WMC), Titan Resources, Estrella Resources and Neometals Ltd.

Geology and Geological Interpretation

The Inco-Boundary deposit occurs on the western limb of the north plunging Mt Edwards anticline, at or near the base of a series of ultramafic flows which overlie a footwall basaltic sequence. The ultramafics range from high MgO to low MgO peridotite and consist of a series of 40-50m thick flows with interflow sediments up to 5m thick.

Drilling has defined a narrow, steep westerly dipping and NNW-plunging zone of nickel sulphide mineralisation. The mineralisation is generally of low grade (≤1 %Ni), although there are a number of higher grade intersections (≥3 %Ni).

Modelling

Geological modelling was completed using Micromine with block modelling and grade estimation completed using Vulcan.

Mineralised domains were modelled based on elevated nickel grades and proximity to the basal surface at the mafic/ultramafic contact. A nominal cut-off grade of 0.4% Ni was used to model the shapes. This was based on the natural nickel cut-off grade determined from the cumulative log-normal distribution graph.

The mineralisation wireframes were supplied by Widgie Nickel and Auralia was responsible for grade interpolation into these shapes. Auralia constructed a lithological contact surface to represent the mafic/ultramafic contact, based on historic geological mapping and drill logs.

Mineralisation is modelled to extend over an 800m strike length to a depth based on current drilling of 400m. Only sulphide mineralisation has been included in the reported mineral resource.

Figure 2 and 3 illustrate the geological interpretation in long section and cross section.

Figure 3: Cross-section showing mineralisation domains- 6,514,800mN

The interpretation was based on a nominal nickel grade only. It was not possible to further define the interpretation into massive, matrix and disseminated sulphides.

Top of fresh rock surface was modelled from the logging codes in drillholes and topographic surface was generated from drillhole collar locations.

Grade Estimation

Nickel was estimated in 3 passes using ordinary kriging. Pass 1 was based on the ranges from the variogram model. In pass 2 the search extents were based on the twice the range indicated in the variogram model and for pass 3 the range was four times the variogram model. Search ellipsoids are oriented parallel to mineralisation.

Model Validation

Table 1 compares the block model grades with the mean composite grades. The mean composite grade is the mean of all the drill composites within the domain and the block grade is the average block model grade within the domain with no cut-off grade applied. The block grade is for all blocks in the domain regardless of if they are in fresh, transitional or oxides areas.

Table 2: Block model and composite grades

| | Domain 98 | Domain 99 |
|------------------------|--------------|--------------|
| Composite count | 212 | 779 |
| Composite grade | 0.61 | 0.79 |
| Block Grade | 0.79 | 0.79 |
| Blocks:composite ratio | 129% | 100% |

Includes oxide/transitional and mined areas

In addition to ordinary kriging, nickel was also estimated with inverse distance squared (ID²). A comparison between these two estimation methods reported at a cut-off of 1% and 0.5% Ni is shown in Table 3. Results are shown with no rounding of numbers. There is a very good correlation between the different modelling techniques.

Table 3: Comparison between ordinary kriged and inverse distance estimation

| | Inverse distance squared | | | Ordir | ary krige | ł |
|-----------------|--------------------------|-------|--------|-----------|-----------|--------|
| 1% Ni cut-off | Tonnes | Grade | Ni t | Tonnes | Grade | Nit |
| Fresh | 453,370 | 1.30 | 5,912 | 464,144 | 1.20 | 5,588 |
| 0.5% Ni cut-off | Tonnes | Grade | Ni t | Tonnes | Grade | Ni t |
| Fresh | 2,790,040 | 0.84 | 23,492 | 2,785,654 | 0.83 | 23,037 |

The swath plot analysis in the following figures indicates that the model represents the underlying composite data. In the graphs in Figure 4 the model grade is represented by the brown line and the composite data by the blue line.

Bulk Density

There are no density measurements from the Inco-Boundary deposit. Based on measurement from nearby nickel sulphide deposits the following densities have been applied.

| Tabl | e 3: | Bu | lk D |)ens | ity |
|------|------|----|------|------|-----|
| | | | | | |

| Lithology | Density |
|--------------------------------|---------------------|
| Fresh Ultramafic Waste | 2.9t/m ³ |
| Fresh Mafic Waste | 2.7t/m³ |
| Fresh Mineralisation | 3.0t/m³ |
| Oxide waste and mineralisation | 2.0t/m ³ |

Mineral Resource Classification

The Inco-Boundary Mineral Resource has been classified as Inferred. The historic nature of the drilling and the lack of QAQC data and bulk density measurements mean that a higher classification cannot be applied. Mineralisation above the top of fresh rock boundary has not been classified. Until mineralogical and metallurgical test-work has been completed and the viability of processing this material is confirmed it will not be included in the resource estimate.

This is consistent with other recently reported Mineral Resource Estimates in the Widgie Nickel tenements at Widgiemooltha.

Grade-Tonnage Curve

The reported Mineral Resource metrics are highly sensitive to cut-off grade, as illustrated in Figure 5. Reduction of the cut-off grade to 0.8% Ni more than doubles the contained nickel compared to the reported Mineral Resource. Furthermore, at a cut-ff grade of 0.5% Ni, the contained nickel increases more than fourfold.

It is worth noting that the Inco-Boundary deposit is in close proximity to an existing historical underground mine at Mt Edwards 26N (which is less than 400 metres to the northeast) and is less than 900 metres from the existing Mineral Resource at Munda, located to the southwest.

Furthermore, the geometry and thickness of the mineralisation is potentially amendable to a large bulk-tonnage style underground operation.

With further upside in the nickel price, Inco-Boundary represents a medium term opportunity to mine at relatively low capital and operating cost should higher payability or sustained high prices prevail.

Figure 5 – Grade-Tonnage curve for the Inco-Boundary deposit

Resource drilling update

In tandem with Inco-Boundary, Widgie continues to positively progress other initiatives in its inaugural drilling campaign, including extending and infilling mineralisation at the Gillett Resource, and developing the new Gillett West basal contact, which was identified as an additional target for nickel mineralisation.

Initial assays remain on track to be received by the end of the current quarter.

Competent Person Statements

The information in this announcement that relates to exploration results and sampling techniques is based on and fairly represents information and supporting documentation compiled by Mr Don Huntly, who is a full-time employee of Widgie Nickel Limited. Mr Huntly is a Competent Person and a member of the Australian Institute of Geoscientists. Mr Huntly has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Huntly consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to the Inco Boundary Mineral Resource is based on, and fairly represents, information and supporting documentation compiled by Richard Maddocks; MSc in Mineral Economics, BAppSc in Applied Geology and Grad Dip in Applied Finance and Investment. Mr Maddocks is a consultant to Auralia Mining Consulting and is a Fellow of the Australasian Institute of Mining and Metallurgy (member no. 111714) with over 30 years of experience. Mr. Maddocks has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the JORC Code. Mr. Maddocks consents to the inclusion in this report of the matters based on his information in the form and content in which it appears.

Appendix 1: JORC Table 1

| Criteria | JORC Code Explanation | Commentary |
|-----------------------|--|---|
| Sampling techniques | Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc).These examples should not be taken as limiting the broad meaning of samplingInclude reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. | Drilling is all historic in nature. Sampling techniques are not known for this drilling as it has not been documented. |
| | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. | |
| Drilling Techniques | Drill type (eg core, reverse circulation, open- hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc). | The Inco-Boundary Mineral Resource is based on diamond core and RC drilling techniques. A total of 270 drill holes totalling 32,209m have been drilled into the deposit area. 95 diamond core holes (23,176m) have been drilled. Some hole types are not known, based on the depths of these holes they have been assumed to be RC. Of the 270 holes, only 7 have been drilled in the past 20 years. Most (229) were drilled in the 1960's and 1970's and there are few details of this drilling documented. WMC drilled 33 holes in the mid-1990's with few documented details. No RAB, Auger or aircore holes have been used in the Mineral Resource estimation. |
| Drill Sample Recovery | Method of recording and assessing core and chip sample recoveries and results assessed. | Sample recovery of drilling was no recorded. |

|---------------------------|---|---|
| Criteria | JORC Code Explanation | Commentary |
| Database integrity | Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. Data validation procedures used. | The database is an accumulation of exploration results by several companies. Data was inspected for errors. No obvious errors were found. Drillhole locations, downhole surveys, geology and assays al corresponded to expected locations. |
| Site visits | Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. | The competent person has visited the site. Ar inspection of the site was conducted on 17 March 2020. |
| Geological interpretation | Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect, if any, of alternative interpretations on Mineral Resource estimation. The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology. | There are sufficient drill intersections through the mineralisation and geology to be confident of the geological interpretation. These types of nickel deposits have been mined in the Kambalda/Widgiemooltha region for many years and the geology is well documented. The basal contact of the ultramafic overlying mafics has been accurately located through many drill hole intersections. The nicke enriched base of the ultramafics, and enriched zones in the hanging wall of the ultramafic has been accurately determined through dril intersections. The basal contact corresponds closely with the higher-grade nickel mineralisation. |
| | The extent and variability of the Mineral Resource expressed as length (along | The modelled deposit has a strike extent of 800m. The deepest part of the mineralised |

Lower levels of nickel mineralisation we generally not included however sometimes f continuity of domain modelling lower gra- intersections were included. The mineral resource was estimated usi Vulcan 2020.4. |
| | previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. The assumptions made regarding recovery of by-products. Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation). In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed. Any assumptions behind modelling of selective mining units. Any assumptions about correlation between variables. | Composites were modelled at 1m intervals reflect the dominant sample intervals in t database. The block size was 5mX, 10m 5mZ. A sub-block size of 1.25mX, 1.25m 1.25mZ was used to accurately model t narrow mineralisation horizon. The pare block size was used in grade estimation. The search directions were based on t orientation of the mineralised horizon Search dimensions were based on the moo variogram ranges. With dimension twice t model ranges to ensure all blocks within t domains were estimated. No assumptions were made on correlation variables. A top cut of 3% nickel was appli to composite data. |
| | Description of how the geological interpretation was used to control the resource estimates. Discussion of basis for using or not using grade cutting or capping. The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. | |
| Moisture | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. | Estimates are on a dry tonne basis |

| | 3 Estimation and Reporting of N The basis of the adopted cut-off grade(s) | The cut-off grade of 1% Ni used for reporting | | | | |
|---|---|--|--|--|--|--|
| Cut-off parameters | or quality parameters applied. | corresponds to a potential mining cut-of grade appropriate for anticipated mining methods. | | | | |
| Mining factors or assumptions | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. | No mining factors have been implicitly used the model. | | | | |
| Metallurgical factors or assumptions | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. | No metallurgical factors have been assume however the oxide and transitional zone require additional mineralogical ar metallurgical test-work to establish the natu and occurrence of nickel mineral species. F this reason only fresh mineralisation has bee included in the reported Mineral Resource. | | | | |
| Environmental factors or assumptions | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | No environmental factors or assumptions we used in the modelling. | | | | |
| Bulk density | Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, | Bulk density within the deposit was assum- based on other deposits in the Widgiemoolth region Transitional/oxide material was assigned density of 2.0. Fresh Mafic waste 2.7 and ultramafic waste 2.9. Mineralised fre material was assigned 3.0t/m ³ . | | | | |

| | Section | 3 Estimation and Reporting of N | Aineral Resources |
|---------------|-----------------------|--|--|
| | | <i>between rock and alteration zones within the deposit.</i> | |
| | | <i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i> | |
| \bigcirc | | <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i> | The Mt Edwards Mineral Resource has been classified as Inferred. Oxide and transition material was not classified. The main criteria |
| Classificatio | n | Whether appropriate account has been taken of all relevant factors (i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data. | used for classifying inferred material was lack of data for drill type, QAQC data and bulk density. This classification reflects the Competent Person's view of the deposit. |
| | | Whether the result appropriately reflects the Competent Person's view of the deposit. | |
| Audits or rev | views | The results of any audits or reviews of Mineral Resource estimates | Auralia Mining Consulting are independent of Widgie Nickel. |
| Discussion o | of relative accuracy/ | Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. | This Mineral Resource Estimate represents a global estimate of Mineral Resources at Inco- Boundary. The stated tonnages and grade reflect the geological interpretation and the categorisation of the mineral resource estimate reflects the relative confidence and accuracy. |
| | | The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. | |
| | | These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. | |

APPENDIX 3: SIGNIFICANT DRILL INTERSECTIONS

This is a table of all drilling intersections within the modelled domains. Low grade intersections have been included where continuity of the mineralised shape necessitated it.

| Hole | Length (m) | From (m) | To (m) | Domain | Ni % |
