
SUCCESSFUL MAIDEN DRILLING CONFIRMS DISCOVERY AT THOR ISR URANIUM PROJECT

Highlights:

- Maiden ~15,000m drill program completed on schedule and within budget.
- Drilling has so far discovered 17,640 feet of mineralised roll fronts within the Thor project with 80% of GTI's total land holding in the Great Divide Basin still to be drill tested.
- Mineralisation demonstrates characteristics conducive to ISR recovery.
- Drilling discovered at least 3 separate roll fronts present in the main host sand.
- 35 holes met or exceeded the target uranium cutoff grade.
- 23 holes drilled recording better than the minimum targeted economic Grade Thickness (GT) cutoff of 0.2GT¹ with an average of 0.57 GT.
- Follow-up drilling planned at Thor will focus on the eastern portion of the claim block and the Wyoming State mineral leases to the north-east.
- Drilling also planned at GTI's Odin Project, ~10kms north, alongside Thor follow-up drilling.
- GTR is actively pursuing its strategy in Wyoming to aggressively capitalise on supportive conditions for US domestic uranium supply.

GTI Resources Ltd (**GTI** or **Company**), has successfully completed its maiden 100-drill hole exploration program at the Thor ISR uranium project in Wyoming's Great Divide Basin (**GDB**) (**Figure 1**). Two mud rotary rigs completed 100 holes for 48,540ft (~15,000m) of drilling on time & within budget (**Figure 2**).

Doug Beahm of BRS Engineering, who managed the campaign, commented "the program at GTI's Thor ISR Project in Wyoming successfully identified mineralisation with economic potential based on widths, grades and depth of mineralisation¹. The drilling finished on time within budget & exceeded our expectations for the number of mineralised holes and the tenor of mineralisation encountered. The mineralisation shows potential for development with a well mineralised & consistent thickness of ISR amenable sands starting at around 100 feet below the water table. These results indicate follow on drilling is merited & so we have started work on planning & permitting a follow-up drill campaign at Thor plus first pass reconnaissance drilling at GTI's Odin Project located approximately 10kms to the north of Thor."

Executive Director Bruce Lane commented "results from the first 100 holes at Thor strongly justify follow on campaigns across our Wyoming ground this summer. The historical Kerr McGee drill maps, which were used to guide this drilling, proved to be instrumental in generating our high strike rate from the drilling. The nature of the mineralisation identified in the western & eastern sections of the project shows potential for development and we are sufficiently encouraged to continue to invest in further drilling including at the yet to be tested lease blocks in north-eastern section of the project area. I'm excited by the fact that this first, wide spaced, drill program covered less than 20% of GTI's total land holding in the Great Divide Basin with most of our ground still to be tested. We look forward to continuing exploration at a time when we think conditions for US domestic uranium supply, particularly in Wyoming, have seldom looked better."

¹ Typical economically viable ISR grade & GT cut-offs are: 0.02% (200ppm) U₃O₈ & 0.2GT i.e., 10 ft (3m) @ 0.02% (200ppm) U₃O₈

Figure 1. Thor Project Location & Drilling Map, Great Divide Basin, Wyoming USA.

Drilling Results Commentary

100 drill holes were completed at the Thor Project for a total of 48,540 feet (14,795 metres) (**Figures 1 & 2**). Results from the 100 holes (including those previously reported) were characterised by (**Table 1**) and included:

- 35 holes which met or exceeded the cutoff grade of 0.02% eU₃O₈ (200 ppm).
- 23 holes drilled to date met both grade and GT cutoff with an average of 0.57GT; and
- Of 67 holes, 12 met grade cutoff but not GT, 29 had trace mineralisation & 36 were barren.

Note: Typical economically viable ISR grade & GT cut-offs are: 0.02% (200ppm) U₃O₈ and 0.2GT - i.e., 10 ft (3m) @ 0.02% (200ppm) U₃O₈.

These results are in line with or better than expectation and are viewed by the Company as indicative of high potential for economic ISR uranium mineralisation.

The mineralisation encountered meets and or exceeds expectations for economic ISR uranium recovery. Drilling has confirmed that the historic Kerr McGee data is an excellent guide for drilling. Drilling showed that the geological and hydrogeological setting of the mineralisation appears to be conducive to ISR recovery with the main host sand appearing to be continuous in the area and the water table being over 100 feet above the main host sand.

Drilling has shown that there are at least 3 separate roll fronts present in the main host sand with additional sands positioned above and below the main sand unit showing at least trace mineralisation.

GTI's exploration objective for this drill program was to identify REDOX boundaries and potential host sands in addition to defining the depth, thickness, grade and width of mineralisation across the REDOX front. The Company is targeting mineralisation 50 feet (15 metres) or more below the water table.

Ultimately the Company is focused on defining mineralisation similar to that discovered and mined at the nearby Lost Creek deposit and that otherwise meets typical economic cutoff criteria for sandstone hosted ISR uranium projects in Wyoming's Great Divide Basin e.g.:

- Grade greater than 0.02% (200 ppm) U₃O₈
- Grade x Thickness (GT) greater than 0.2 (10 ft @ 0.02 - 3 metres @ 200ppm U₃O₈)
- Width of mineralisation above cutoff nominal 50 feet (15 metres) and nominal GT of 0.4

UR Energy's Lost Creek ISR uranium deposit (**Figure 1**) is reported to contain a remaining 18Mlbs at cutoff Grade Thickness (GT) of 0.2 and made up of 11.9Mlbs of U₃O₈ at average grade of 0.046% eU₃O₈ (Measured and Indicated) and 6.6Mlbs of U₃O₈ at average grade of 0.044% eU₃O₈ (Inferred).³

This has been a successful first drill program in Wyoming and indicates that follow-up drilling is warranted. Planning and permitting is underway for a follow-on summer drill campaign at Thor in addition to first pass reconnaissance drilling at GTI's Odin Project. The Odin Project is located approximately 10kms to the north of Thor and proximate to URE's Lost Soldier deposit and UEC's Antelope & Twin Buttes projects.

Further details of the impending summer drilling campaign in Wyoming will be provided in due course.

Vesting of Performance Rights

The Company advises that 9.25 million Class B Performance Rights have vested following the achievement of two performance conditions as set out below ⁴.

1. 29 March 2022 (4.625M rights) - Exploration including drilling of at least 10,000m of new drill holes.
2. 26 November 2021 [inclusive] (4.625M rights) - The VWAP of GTI's shares over 20 consecutive trading days on ASX being equal to or more than a 100% premium to the previous capital raising share price of 1.5¢.

Competent Persons Statement

The information in this announcement that relates to the Exploration Results is based on information compiled and fairly represents the exploration status of the project. Doug Beahm has reviewed the information and has approved the scientific and technical matters of this disclosure. Mr. Beahm is a Principal Engineer with BRS Engineering Inc. with over 45 years of experience in mineral exploration and project evaluation. Mr. Beahm is a Registered Member of the Society of Mining, Metallurgy and Exploration, and is a Professional Engineer (Wyoming, Utah, and Oregon) and a Professional Geologist (Wyoming). Mr Beahm has worked in uranium exploration, mining, and mine land reclamation in the Western US since 1975 and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and has reviewed the activity which has been undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of exploration results, Mineral Resources and Ore Reserves. Mr Beahm provides his consent to the information provided.

GTI RESOURCES LTD SUMMARY OF PROJECTS

GREAT DIVIDE BASIN ISR URANIUM, WYOMING, US

GTI resources has acquired 100% of ~22,000 acres (~8,900 hectares) across several groups of strategically located and underexplored mineral lode claims (**Claims**) and 2 state leases (**Leases**), prospective for sandstone hosted uranium that is amenable to low cost, low environmental impact ISR mining. The properties are located in the Great Divide Basin (**GDB**), Wyoming, USA & the Uravan Belt, Colorado, USA (the **Properties**). The Wyoming Properties, being GTI's priority for exploration, are located in proximity to UR Energy's (**URE**) Lost Creek ISR Facility & Rio Tinto's (**RIO**) Sweetwater/Kennecott Mill and the GDB roll front REDOX boundary.

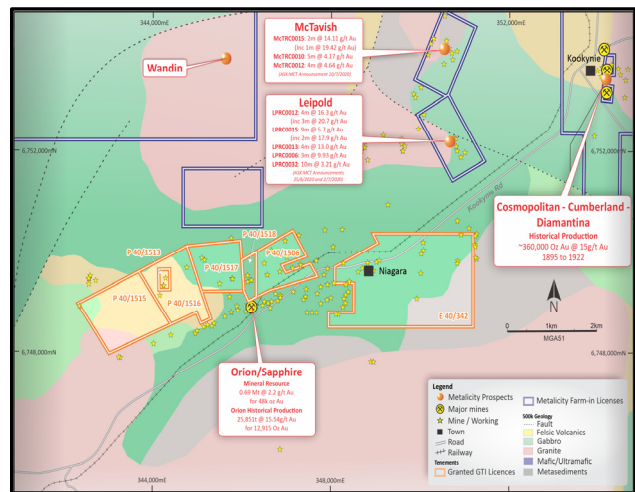

HENRY MOUNTAINS URANIUM/VANADIUM, UTAH, US

The Company has ~1,500 hectares of land holdings in the Henry Mountains region of Utah, within Garfield & Wayne Counties. Exploration has focused on approximately 5kms of mineralised trend that extends between the Rat Nest & Jeffrey claim groups & includes the Section 36 state lease block. Uranium & vanadium mineralisation in this location is generally shallow at 20-30m average depth. The region forms part of the prolific Colorado Plateau uranium province which historically provided significant uranium resources in the USA. Sandstone hosted ores have been mined in the region since 1904 and the mining region has historically produced in excess of **17.5Mt @ 2,400ppm U₃O₈ (92Mlbs U₃O₈) and 12,500 ppm V₂O₅ (482Mlbs V₂O₅)⁵.**

NIAGARA (KOOKYNIE) GOLD, WESTERN AUSTRALIA⁶

The Niagara project is located ~6 km southwest of Kookynie in the central goldfields of Western Australia. The project comprises one granted exploration licence, and eight prospecting licences. Access to the project is provided via Goldfields Highway from the town of Menzies and the sealed Kookynie Road. The project is located within the central part of the Norseman-Wiluna greenstone belt. Historical mine records, from WAMEX reports, show that historical workings produced **5,100oz Au** at a grade of **25.8 g/t** between 1898 & 1914.⁷ **On 03/02/2022, GTI advised ASX of the execution of a binding Tenement Sale & Purchase Agreement for the sale of the Niagara Gold Project to Regener8 Resources NL via an IPO on the ASX⁸.**

1. JORC CODE, 2012 EDITION – TABLE 1 REPORT TEMPLATE

1.1 Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity & the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> Downhole instruments were utilized to measure natural gamma emission from the rock formation. Natural gamma data from a calibrated sonde was utilized to calculate eU₃O₈ grades. Geophysical logging was completed by Hawkins CBM Logging of Wyoming, utilising a recently calibrated gamma ray sonde for measurement of naturally occurring radioactivity (total gamma). Prior to deployment in the field, the sonde was calibrated at the U.S. Department of Energy uranium logging Test pits located in Casper, Wyoming, for the known range and uranium grades present at the Great divide Basin project.
Drilling techniques	<ul style="list-style-type: none"> Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> 100 rotary drill holes have been completed to date. The drill program is continuing. All holes were vertical and 5 inches in diameter.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<ul style="list-style-type: none"> Where practical rotary samples were collected for possible assay Samples were taken at 5-foot increments for lithological logging and have been preserved for future reference.

Criteria	JORC Code explanation	Commentary
Logging	<ul style="list-style-type: none"> • Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies & metallurgical studies. • Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. • The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> • Lithologic logging of all drill holes was completed by geologists under the direction of the CP. • Geophysical logging provided qualitative analyses of radiometric equivalent uranium thickness and grade. •
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • If core, whether cut or sawn & whether quarter, half or all core taken. • If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. • For all sample types, the nature, quality and appropriateness of the sample preparation technique. • Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. • Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. • Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> • No core was taken. Thus, no chemical assays are available. This is typical at this stage of exploration. Future drilling program will include coring to assess equilibrium conditions. • Rotary samples were collected for lithological identification. •
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. • For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. • Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> • The data was limited to eU₃O₈ calculations based on data supplied by a calibrated downhole gamma sonde. • Natural gamma data from a calibrated sonde was utilized to calculate eU₃O₈ grades. • Geophysical logging was completed by Hawkins CBM Logging of Wyoming, utilising a recently calibrated gamma ray sonde for measurement of naturally occurring radioactivity (total gamma). • Prior to deployment in the field, the sonde was calibrated at the U.S. Department of Energy uranium logging Test pits located in Casper, Wyoming. • eU₃O₈ grade is considered to be an equivalent assay value • Rotary samples were collected for lithological identification.
Verification of sampling and	<ul style="list-style-type: none"> • The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. 	<ul style="list-style-type: none"> • All data was reviewed by the CP. • No adjustments made to the raw gamma data, or to the calculated eU₃O₈ values outside of standard industry methods.

Criteria	JORC Code explanation	Commentary
assaying	<ul style="list-style-type: none"> Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> Existing drill holes were surveyed with a Trimble Geo XT GPS, with +/- 0.3m accuracy for northing and easting. Topographic Control (elevation) is from GPS. Accuracy +/- 0.5m Drill hole locations are shown on Figure 2 & Table 2. Location data was collected in latitude and longitude as well as State Plane coordinates.
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	<ul style="list-style-type: none"> Spatial distribution of drill holes was planned to identify the REDOX boundaries indicated by historical data. Downhole gamma logging data was interpreted on 6-inch (0.15m) intervals following standard uranium industry practice in the U.S.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> No bias was imparted on the downhole data collected. Mineralisation is generally flat-laying and completed drill holes were vertical.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> Geophysical logging data was provided electronically and was provided to GTI and is stored on BRS' local data server which has internal backup and offsite storage protocols in place.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> No audits or reviews have been undertaken on the downhole geophysical survey data. The calibration data & methods were reviewed & verified by the CP.

1.2 Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The Great divide Basin Project is located on unpatented mining lode claims. The Thor portion of the project is shown on Figure 2 & Table 2. The mining claims will remain valid so long as annual assessment and recordation payments are made.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> Exploration for uranium occurred until the late 1970s to early 1980s. Limited information and/or data is available from these activities.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> Uranium deposits associated with fluvial channels and reducing environments within fluvial sandstones. (sandstone-type roll-front uranium deposits)
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<ul style="list-style-type: none"> The location of all existing drill holes is presented in Figure 2 & Table 2. All drill holes are vertical, with measured thicknesses interpreted to equal true thicknesses. All drill holes were approximately 15 cm in diameter. Tables 1 provides the depth, thickness, and equivalent grade of uranium summarized by intercepts data 0.02% eU₃O₈ cut off. Radiometric data is available in the standard US one half foot (6 inches or 15 cm) thicknesses.
Data aggregation	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. 	<ul style="list-style-type: none"> eU₃O₈ grades were interpreted on 6-inch (15 cm) intervals following standard uranium industry practice in the U.S. No eU₃O₈ grade calculations were reported for gamma intercepts below 0.02% eU₃O₈.

Criteria	JORC Code explanation	Commentary
methods	<ul style="list-style-type: none"> Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	<ul style="list-style-type: none"> All drill holes were vertical. Mineralisation within the district is controlled in part by sedimentary bedding features within a relatively flat lying depositional unit. Downhole lengths (intercepts) are believed to accurately represent true widths.
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> Gamma logging results (eU₃O₈ grades) are discussed and reported in the text. eU₃O₈ grades are reported on Tables 1 with drill hole locations presented in Figure 2 & Table 2.
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> All available results have been reported
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> All available results have been reported
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> Further work will include continuation of the planned 100-hole program.
