ASX ANNOUNCEMENT | 2 June 2022 | ASX: BSX

Ta Khoa Drilling Update

- **Portable XRF records up to 20% Ni at New Massive Sulfide Discovery**
- **Resource drilling at Ban Chang and King Snake continues to deliver impressive results**

Blackstone Minerals Limited ("Blackstone" or the "Company") is pleased to provide an update on drilling at the Company's flagship Ta Khoa Nickel Project (TKNP) in northern Vietnam.

New Massive Nickel Sulfide Targets

Blackstone drilling targeting new opportunities within the Ta Khoa district has identified Massive Sulfide Vein (MSV), Semi-Massive Sulfide Vein (SMSV) and Net-textured Sulfide (NTS) mineralisation.

- At the **Suoi Phang** prospect (refer Figures 2, 3), drill hole SP22-01 has intersected 2.95m of sulfide (including MSV, SMSV and NTS) with Portable XRF readings indicating the presence of **up to 20% Ni** (refer Table 1, Table 3, Table 4 and Appendix 1)

- At the **Suoi Chanh** prospect (refer Figure 4), the second drill hole **SC22-02 has intersected SMSV** consistent with the Blackstone Electromagnetic (EM) targeting.

Resource Drilling

Blackstone has continued to drill its most advanced MSV deposits (Ban Chang & King Snake), primarily focusing on upgrading the current resources (refer ASX announcement 23 December 2021) into a higher confidence category. At King Snake, the most recent drilling indicates potential for the deposit to continue to plunge further west and at depth (refer Image 1, Figure 7, Figure 8 & Table 2).

Highlights from infill drilling at Ban Chang include:

Scott Williamson, Blackstone's Managing Director, said:

"It is an exciting phase of exploration for the Company as we start to look at massive sulfide opportunities in addition to Blackstone's established resources at Ban Chang and King Snake. Suoi Chanh is yet another example of our in-house geophysics teams proven track record, with success being achieved from the second drill hole. We look forward to continuing to systematically assess the massive sulfide potential at Ta Khoa."

Suoi Phang

The Suoi Phang prospect is located at the far western end of the Ta Khoa license area and is hosted within Devonian metasediments of the Ban Mong Formation (see Figure 1). Massive sulfide was exposed in a historical adit, and two gossans were exposed in historical trenching (assays up to 5.9% Ni). The northern gossan measures 120m in strike length and the south part of the gossan is 100m long (see Figure 2).

Blackstone's exploration program at Suoi Phang is following up targets generated from surface EM surveying, with the most recent drillhole (SP22-01) intersecting massive sulfide close to surface, and with Portable XRF readings indicating the presence of up to 20% Ni.

*In relation to the disclosure of visual mineralisation, the Company cautions that visual estimates of sulfide mineral abundance should never be considered a proxy or substitute for a laboratory analysis. Assay results are required to determine the widths and grade of the visible mineralisation reported in preliminary geological logging. The Company will update the market when laboratory analytical results become available.

Suoi Chanh

The Suoi Chanh prospect is located at the eastern end of the Ta Khoa license area and is hosted within Devonian metasediments (refer Figure 1). The area is charactered by a high density of mafic – ultramafic dykes. There are some dykes that are strongly differentiated with coarse grained particles in the lower part and grading to fine grains across the dyke. This feature suggests the existence of magma sulfide zones located at the bottom of the dyke. Drillhole SC22-02 has intersected a mafic-ultramafic dyke of 2.55m thickness with 0.1 m semi-massive sulfide. This indicates the potential to find massive sulfide veins common within the Ta Khoa district.

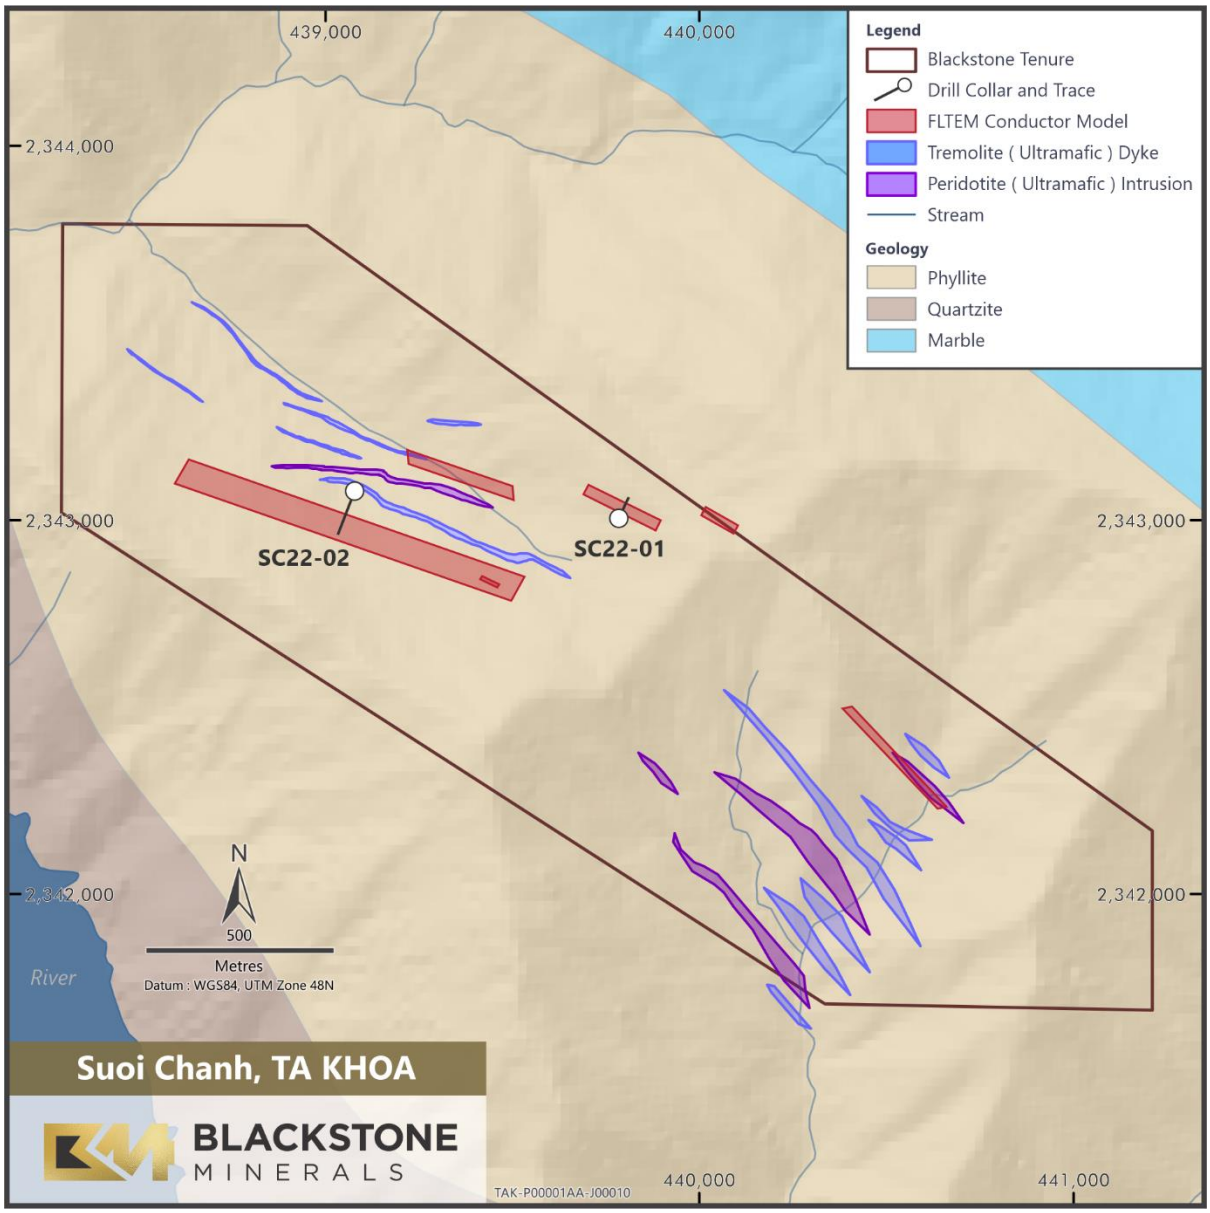

Figure 4. Suoi Chanh Overview Map

Ban Chang

The Ban Chang prospect is located 2.5 km east of the Ban Phuc deposit adjacent to the Chim Van – Co Muong fault system (refer Figure 1). The prospect geology consists of a tremolitic dyke swarm within phyllites, sericite schists and sandstones of the Sap Viet Horizon. The MSV mineralisation consists of two west-east striking, steeply south dipping veins, which are 580m apart along strike. The eastern vein consists of a vein of massive sulfide which has a disseminated ultramafic outer domain encapsulating the MSV. The western vein consists of a single massive sulfide vein. The MSV contains high grade PGEs when compared to the previously mined Ban Phuc MSV deposit which may indicate sulfide segregation in a PGE bearing dyke before formation.

Level 5, 600 Murray Street, West Perth, Western Australia 6005 | PO Box 1175, West Perth WA 6872

The dyke swarms are located along a zone of approximately 1,500 m long and varies between 5 m and 60 m wide. The dykes and massive sulfides are interpreted to be hosted within a splay (and subsidiary structures) off the major regional Chim Van – Co Muong fault system.

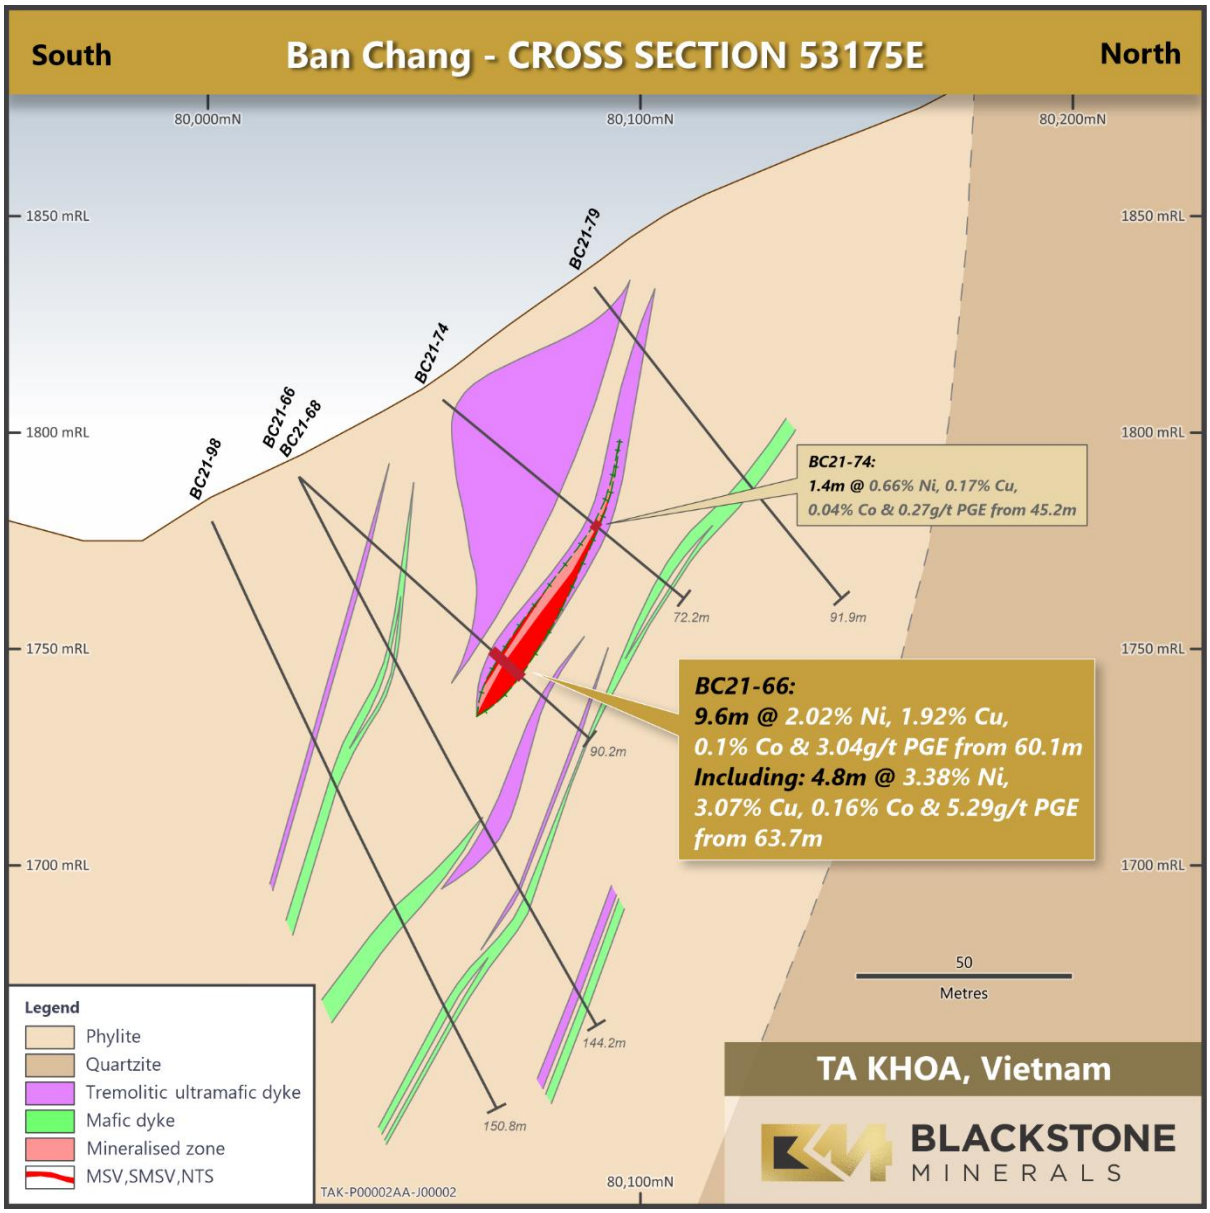

Figure 5. Ban Chang Cross Section 53175E

The current inferred mineral resource for Ban Chang is 0.70 Mt at 1.2% Ni (2.0% NiEQ) and was based on information up to and including drill hole BC21-34 (Oct 2021). The latest round of assays included in this report are from infill drilling programs designed to improve the resource confidence classification.

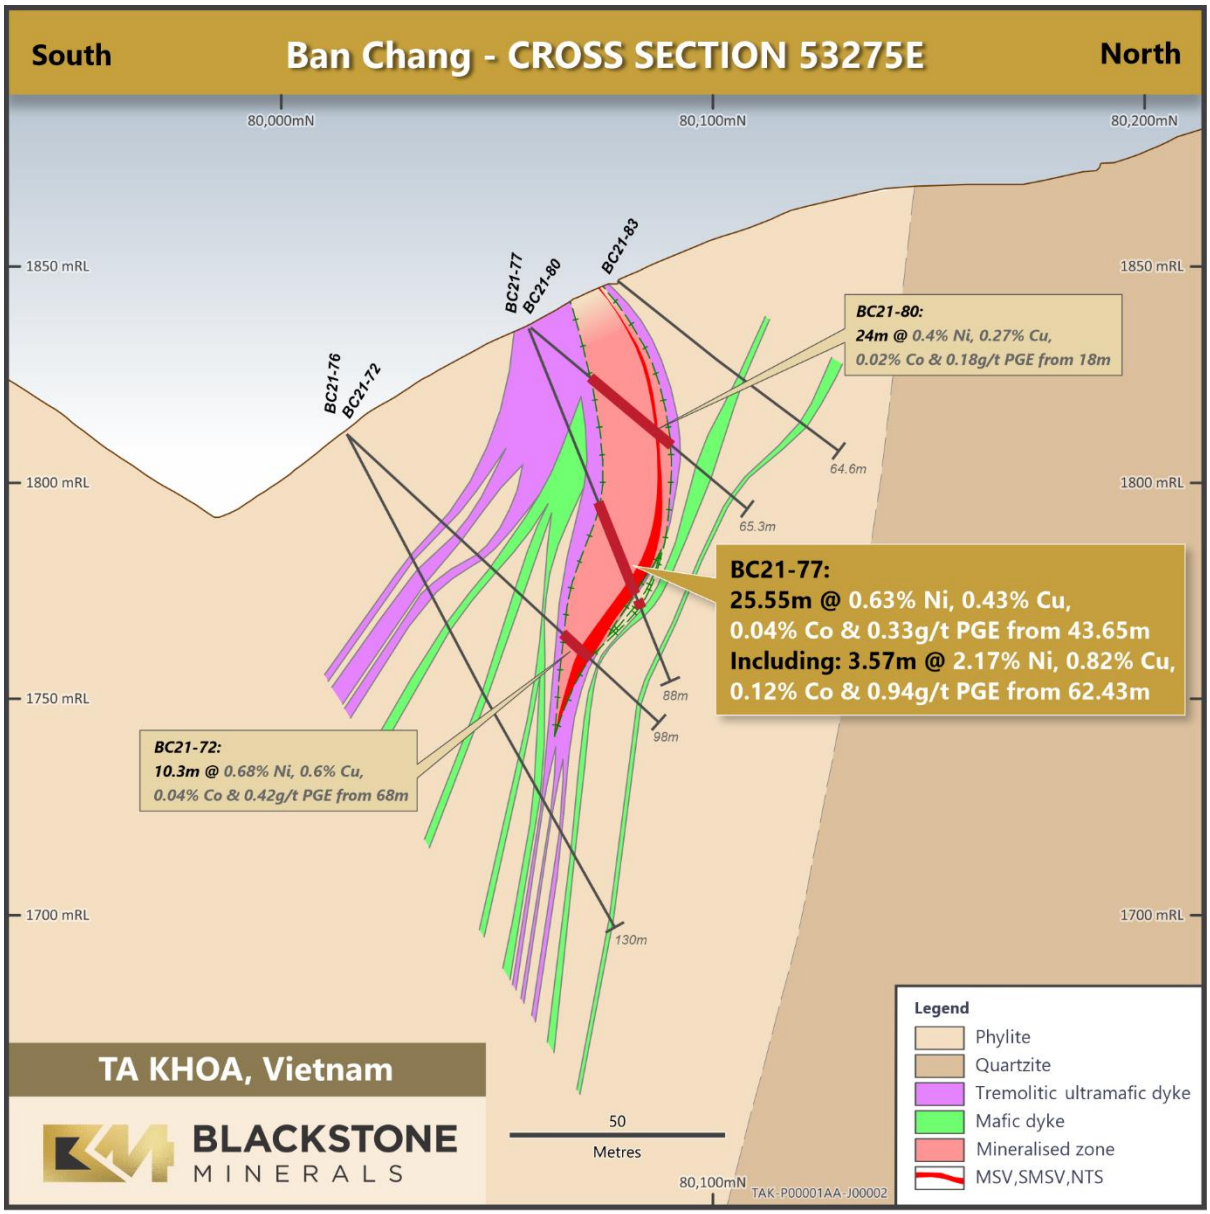

Figure 6. Ban Chang Cross Section 53275E

King Snake

King Snake is located approximately 1 km north of the Ban Phuc disseminated nickel sulfide deposit (refer Figure 1). The King Snake prospect is a typical magmatic MSV of high-grade brecciated Ni-Cu-Co-PGE minerals associated with tremolite-altered mafic-ultramafic dykes developed along a shear zone within the calcareous sediments and quartz-mica schists of the Ban Phuc Horizon.

Similar to Ban Chang, King Snake contains high grade PGEs compared to the previously mined Ban Phuc MSV deposit which indicates that mineralisation was likely formed by sulfide segregation from PGE bearing magma in an active feed dyke.

T +61 8 9425 5217 | **F** +61 8 6500 9982 **| E** admin@blackstoneminerals.com.au | **blackstoneminerals.com.au**

Blackstone's drilling at King Snake has been focussed on EM targets which extend down plunge to the west of historic drilling. Assay results indicate greater thicknesses of sulfide mineralisation down plunge of historic drilling. The higher power surface EM targeting has accurately guided the down plunge drilling hundreds of meters from the historic surface showings. In addition, downhole EM (DHEM) has further directed investigations to wider higher-grade zones throughout this consistent, high grade and tabular massive sulfide vein (refer Figure 7).

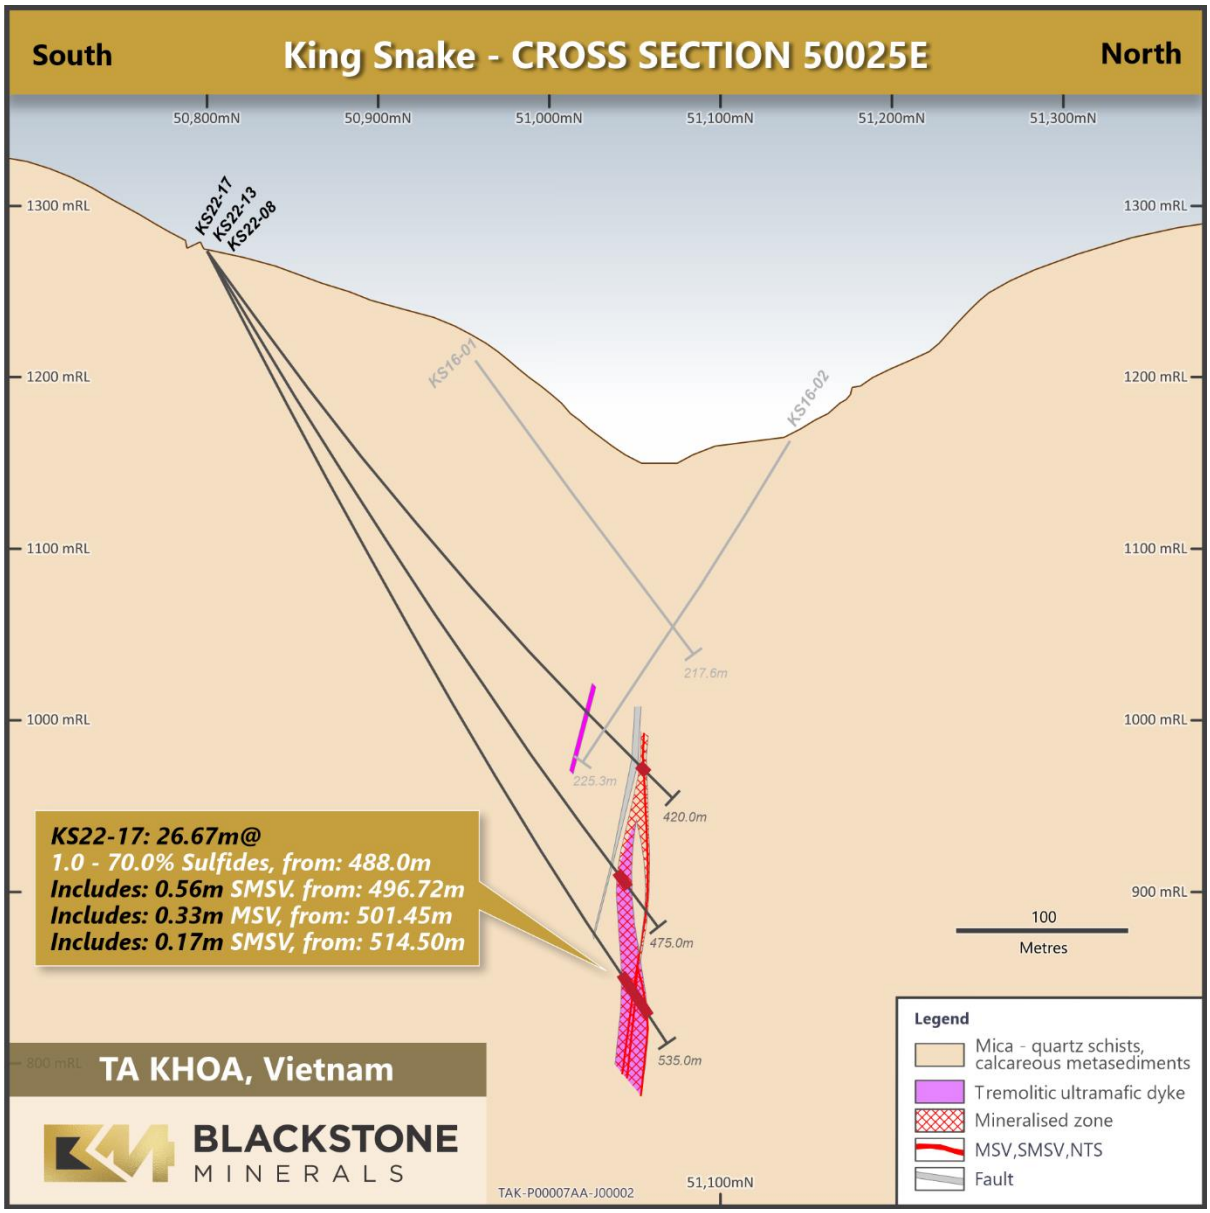

Figure 8. King Snake Cross Section 50025E

The current mineral resource for King Snake is 0.43 Mt at 1.3% Ni (2.4% NiEQ) and was based on information up to and including drill hole KS21-26 (Oct 2021). Recent drilling by Blackstone at King Snake has primarily been infill, however success at KS22-17 (refer Figure 8), suggests potential for mineralisation at King Snake to continue to plunge at depth to the west. Downhole EM survey is being planned at KS22-17.

About Blackstone

Blackstone Minerals Ltd (ASX: BSX / OTCQX: BLSTF / FRA: B9S) is focused on building an integrated upstream and downstream battery metals processing business in Vietnam that produces NCM Precursor products for Asia's growing Lithium-ion battery industry.

The Company owns a 90% interest in the TKNP. The TKNP is located 160km west of Hanoi in the Son La Province of Vietnam (refer Figure 9) and includes an existing modern nickel mine built to Australian standards, which is currently being used to process nickel ore delivered by the underground bulk sample program. The Ban Phuc nickel mine successfully operated as a mechanised underground nickel mine from 2013 to 2016.

Blackstone's TKNP and Ta Khoa Refinery (TKR) are the two major cogs in Blackstone's vertically integrated development strategy (together - the Ta Khoa Project). The Company's development strategy is underpinned by Blackstone's ability to secure nickel concentrate and Ta Khoa is emerging as a nickel sulfide district of enviable scale with several exploration targets yet to be tested.

In February 2022, Blackstone completed a Pre-Feasibility Study for the TKNP, and presented this on an integrated basis with the proposed TKR development (refer ASX announcement 28 February 2022). The TKR is being designed to have a refining capacity of 400ktpa, with feedstock provided from a combination of concentrate from the TKNP and third-party feed sources (3PF). Pilot Plant testing and Definitive Feasibility Studies are underway and will continue to technically de-risk the Ta Khoa Project.

At both the mine (upstream) and refinery (downstream) level, Blackstone is focused on a partnership model and is collaborating with groups who are focused on sustainable mining, minimising carbon footprint and implementing a fully vertically integrated supply chain.

Table 4

Drill hole assays, preparation by SGS, Hai Phong, assays by ALS Geochemistry, Perth (see Appendix One for assay methods). Note: na denotes assay result not available (element was not determined), < - below the detection of the test performed.

Complete assay interval data is provided below for drill holes marked with "*" in Table 3.

Appendix One
JORC Code, 2012 Edition | 'Table 1' Report

Section 1 Sampling Techniques and Data
The notes compiled here specifically relate to the new (previously unannounced) drill holes and assays, namely BC21-43 to BC22-02, KS21-30 to KS21-44, TC21-04 to TC21-43 and SP21-01 to SP21-02, and drill holes KS22-01 to KS21-17, SP22-01 and SC22-02 for which assays are not yet available and visual sulfide abundances are presented in the above report. Previous drilling results are explained in previous ASX announcements.

Criteria	JORC Code explanation	Commentary
Sampling techniques	• Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. • Measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. • Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	• Assays are reported for 155 diamond core drill holes for a total of 27,470 m of drilling. • The drill core was cut by diamond core saw and continuous quarter (NQ & HQ) core sample taken for assay according to lithological criteria in intervals ranging from 0.3 m to 2.65 m with a mean of 1 m. • Sample weights for assay ranged from approx. 0.3 to 4.7 kg with a mean of c. 1.3 kg. • Drilling and sampling were both supervised by a suitably qualified geologist. • Visual sulfide abundances were estimated by suitably qualified Ban Phuc Nickel Mines geologist and the presence of Ni and Cu confirmed using a Niton portable XRF device. • For the Company's best understanding of previous owner's drilling please refer to previous Blackstone Minerals' announcements to the ASX and additionally available from http://blackstoneminerals.com.au.

The identified nickel and copper sulfide mineralisation within the project include disseminated, net texture and massive sulfide types. The disseminated and net textured mineralisation occurs within dunite adcumulate intrusions, while the massive sulfide veins typically occur in the

Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results. • If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. • If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	• All intervals reported in Table 3 are down hole. • Structural orientations determined from orientated drill core suggest that the reported intersections and intervals are >80% of the true thicknesses for Ban Chang and Ta Cuong. • The King Snake intersections range from c. 60 to >80% of true thickness. • Appropriate drill sections are included in the body of this release.
