

# INTERIM SEYMOUR MINERAL RESOURCE DOUBLES TO 9.9MT

## HIGHLIGHTS

- Total Mineral Resource tonnage up 105% to 9.9 Mt @ 1.04% Li<sub>2</sub>O.
- Indicated Category Mineral Resource increased 2.5x to 5.2 Mt @ 1.29% Li<sub>2</sub>O
- Approximately 53% of total Seymour Mineral Resource classified as Indicated.
- North Aubry deposit remains open along strike and at depth.
- Further step-out drilling of North Aubry set to continue over H2 2022.
- Very low discovery cost for new resources circa \$1.30 tonne.

Green Technology Metals Limited (ASX: GT1) (GT1 or the Company) is pleased to advise of an interim Mineral Resource Estimate update for its Seymour Lithium Project in northwest Ontario, Canada.

**Table 1: Global Seymour (Aubry) Mineral Resource Estimate**

Deposit	Interim 2022 MRE (0.2% Li <sub>2</sub> O cut-off)			2019 MRE (no cut-off)		
	Tonnes (Mt)	Li <sub>2</sub> O (%)	Ta <sub>2</sub> O <sub>5</sub> (ppm)	Tonnes (Mt)	Li <sub>2</sub> O (%)	Ta <sub>2</sub> O <sub>5</sub> (ppm)
<b>North Aubry</b>						
Indicated	5.2	1.29	161	2.1	1.29	210
Inferred	2.6	0.90	120	1.7	1.50	189
<i>North Aubry total</i>	<i>7.8</i>	<i>1.17</i>	<i>148</i>	<i>3.8</i>	<i>1.38</i>	<i>200</i>
<b>South Aubry</b>						
Inferred	2.1	0.5	90	1.0	0.80	186
<i>South Aubry total</i>	<i>2.1</i>	<i>0.5</i>	<i>90</i>	<i>1.0</i>	<i>0.80</i>	<i>186</i>
<b>Global Seymour total</b>	<b>9.9</b>	<b>1.04</b>	<b>137</b>	<b>4.8</b>	<b>1.25</b>	<b>186</b>

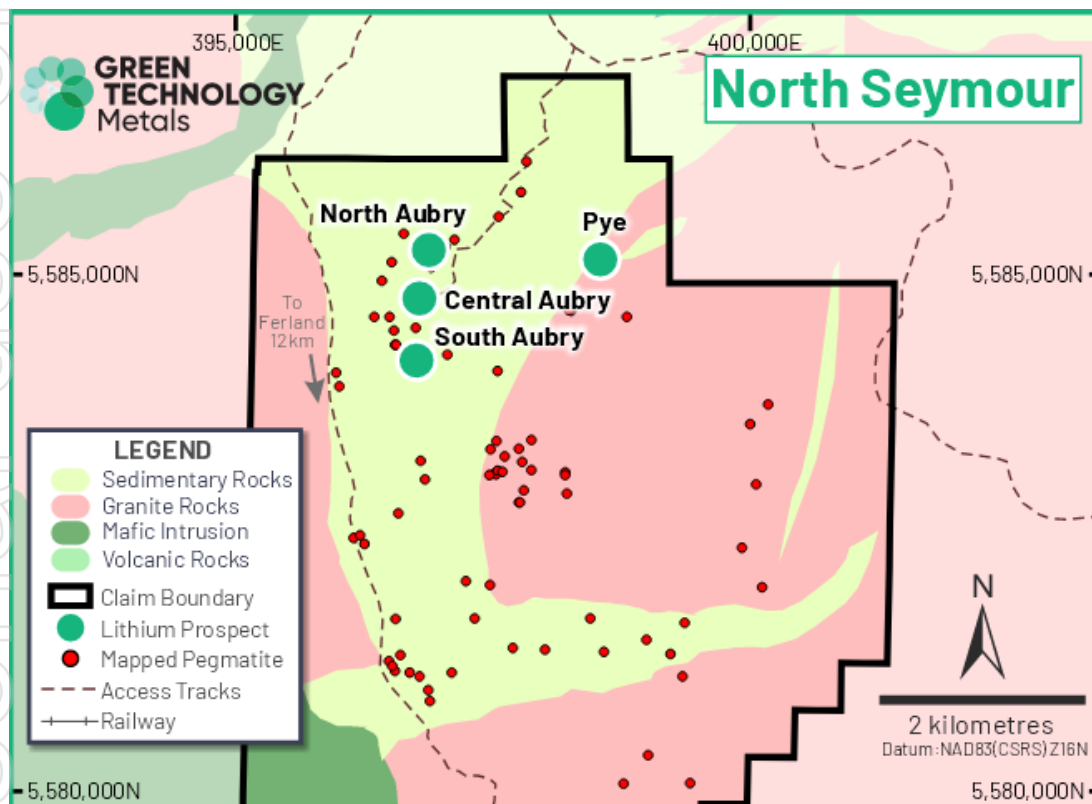

1. MRE produced in accordance with the 2012 Edition of the Australasian Code for Reporting of Mineral Resources and Ore Reserves.
2. Figures constrained to US\$4,000/t SC6 open pit shell and reported above a 0.2% Li<sub>2</sub>O cut-off; numbers have been rounded.

**"We are very pleased with the outcomes from the interim Mineral Resource update at Seymour following completion of the successful Phase 1 drilling program at North Aubry earlier this year. The result is a demonstration of the clear potential that exists at our flagship Seymour asset, and we remain focussed on delivering further high-grade resource growth over the second half of 2022."** CEO, Luke Cox

## Seymour Project interim Mineral Resource Estimate update snapshot

The updated Mineral Resource Estimate (**MRE**) for the Seymour Lithium Project builds on and extends the MRE undertaken by Mr Phillip Jones in 2019 on behalf of Arden Limited. It incorporates all historic drilling plus the recent Phase 1 drilling undertaken at North Aubry by GT1. This comprises a total of 199 diamond holes (predominantly NQ core diameter), of which 23 were from the GT1 Phase 1 campaign, for a total of 26,244 metres.

**Figure 1: Location map of northern area of the Seymour Project showing North and South Aubry deposits, Central Aubry zone and Pye prospect**

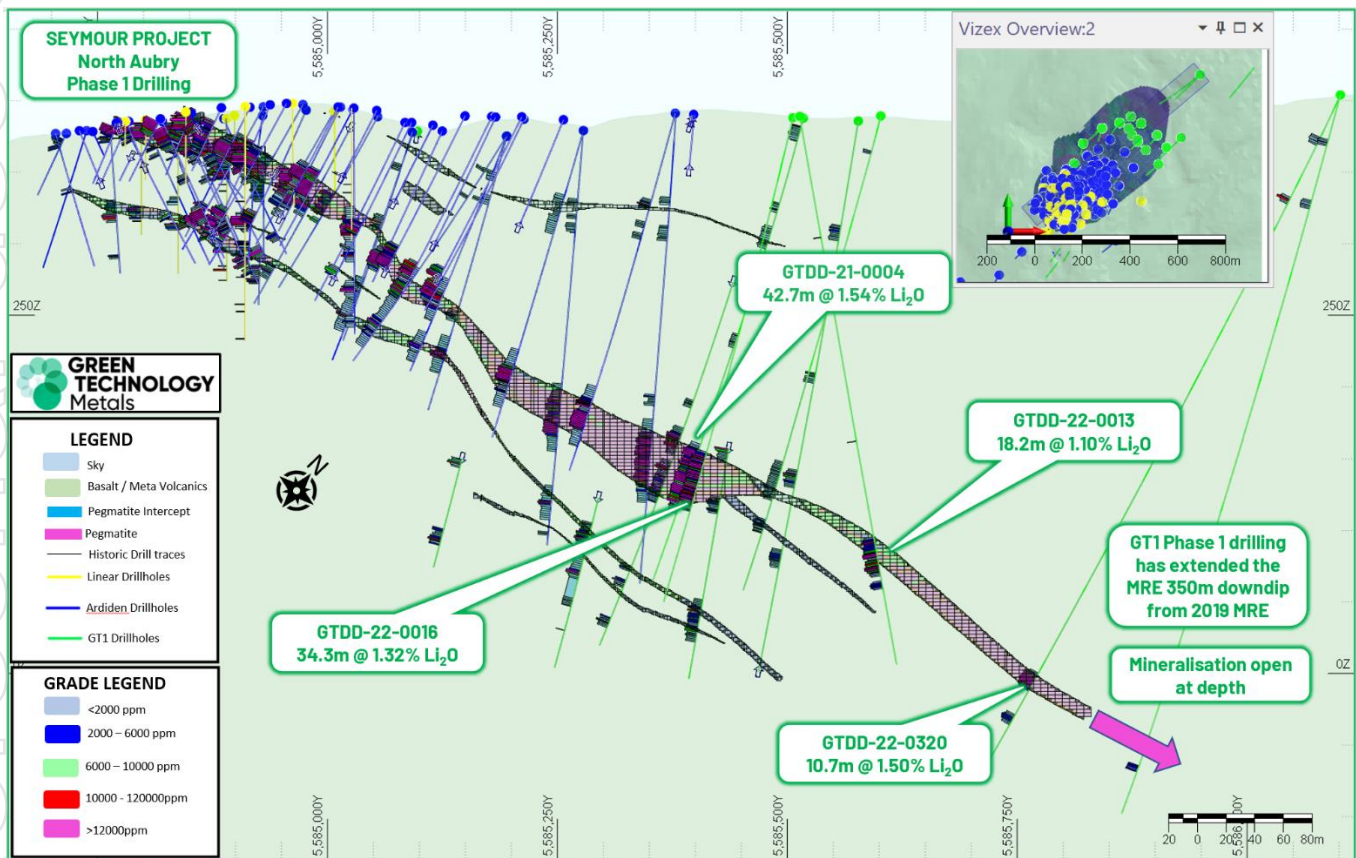

The updated MRE comprises two deposits within the Aubry complex at Seymour, North and South Aubry. It has been constrained to pit shells generated through the Micromine Pit Optimiser module. Pegmatite tonnes and grade are reported above a 0.2% Li<sub>2</sub>O cut-off within the pit shell on a dry basis.

**Table 2: Seymour 2022 MRE Grade-Tonnage Data**

Interim 2022 MRE		
Grade cut-off (% Li <sub>2</sub> O)	Tonnes (Mt)	Li <sub>2</sub> O (%)
0.0	10.2	1.01
<b>0.2</b>	<b>9.9</b>	<b>1.04</b>
0.4	8.6	1.15
0.6	7.3	1.27

The North and South Aubry deposits trend NE and N-NW respectively with approximately 400m separation towards 220 azimuth between them (an area known as the Central Aubry zone). Drilling in the southern half of the Central Aubry zone has yet to find any pegmatites that may link the two deposits. The northern half of the Central Aubry zone is yet to be extensively tested.

The North Aubry deposit has 8 stacked pegmatites interpreted of varying thicknesses and grades, with the North Upper (containing the North Upper HG – high grade domain) being the thickest, and most well-endowed with spodumene, of the 8 pegmatites. One of these pegmatites is poorly mineralised and has not been included in the MRE.

**Figure 2: Cross section showing the impact of the Phase 1 drilling campaign - oblique section along 045 A-B**

The North Aubry pegmatites have been interpreted to extend down dip up to 800m at shallow-to-moderate angles to the northeast with potential for further expansion down dip and to the north. GT1 drilling has already extended the North Aubry deposit over 350m from the deepest previous drill holes in this area.

### Comparison with 2019 MRE

The previous Seymour MRE (**2019 MRE**) was undertaken by independent consultant, Mr Phillip Jones, on behalf of Ardiden Limited in 2019.

Subsequently, GT1 has undertaken its Phase 1 drilling campaign at Seymour from late 2021 into Q2 2022. This program of 23 holes has informed the 2022 MRE by extending the known mineralisation dimensions at North Aubry down dip and along strike, as well as improving confidence in some areas of mineralisation.

The 2019 MRE interpreted 4 pegmatite units, 2 at North Aubry and another 2 at South Aubry. The 2022 MRE includes these 4 pegmatites, but also incorporates a further 4 minor pegmatites within the Mineral Resource area. The 2019 MRE has four domains that did not attempt to capture these minor pegmatites as they were previously considered uneconomic due to the depressed SC6 values around that time.

The 2022 MRE uses Ordinary Kriging to interpret pegmatite units whereas the 2019 MRE used an Inverse Distance Cubed methodology. The 2022 MRE incorporates a higher-grade envelope (0.3% Li<sub>2</sub>O) within the principal pegmatite unit to better define the well mineralised areas from less mineralised areas within the pegmatite.

Bulk density values in the 2022 MRE are unchanged from the 2019 MRE (following review by GT1). However, the 2022 MRE has adopted a cut-off grade of 0.2% Li<sub>2</sub>O and been constrained within pit shells, whereas the 2019 MRE had no cut-off grade or pit shell constraints applied.

As outlined in Table 1, North Aubry 2022 MRE tonnage more than doubled (to 7.8Mt) due to deposit extensions demonstrated by the recent Phase 1 drilling campaign, with the drop in average lithium grade attributable to the Inferred component (which was a function of due to the inclusion of lower grade adjacent pegmatites). Indicated 2022 MRE tonnage at North Aubry increased approximately 2.5 times (to 5.2 Mt) at the same average grade (1.29% Li<sub>2</sub>O) as the Indicated 2019 MRE.

South Aubry MRE tonnage also increased significantly due to the reinterpretation and extension of the South Upper pegmatite. This is a lower grade pegmatite, and the additional tonnes here were responsible for the drop in average grade at South Aubry.

### **Further resource growth potential**

The **Exploration Target** of 22 – 26 Mt @ 0.8-1.5% Li<sub>2</sub>O which sits within the Aubry Complex still remains current with further drilling planned. Previous field mapping completed between 2016 and 2018 highlighted numerous pegmatites across the Aubry Complex and Seymour project (Figure 1). Now the snow has receded GT1 Geologists will return to the mapped pegmatites with the added advantage of field sampling via our pXRF loaded with LCT libraries and the Bravo Raman enabling us to determine if the pegmatites are LCT (Spodumene) or Barren. Once mapped and tested the pegmatites will be ranked and assigned a drill date.

*The potential quantity and grade of Exploration Targets is conceptual in nature, there has been insufficient exploration to estimate a Mineral Resource in these areas and it is uncertain if further exploration will result in the estimation of a Mineral Resource in these areas.*

The **North Aubry deposit** remains open to the north and down dip of the current MRE. Follow up extensional drilling has already commenced with significant initial success (see GT1 ASX release dated 19 May 2022) and is expected to continue through coming months.

The northern half of the **Central Aubry zone** is yet to be extensively tested. This area is also planned to be drilled in the next few months (further Phase 2 drilling).

**Figure 3: North and South Aubry Mineral Resource “complex” - Coloured by Resource classification**

Substantial further resource growth potential exists across the Aubry complex and the broader Seymour Project. Specific step-out and exploration drilling targets set to be tested in H2 2022 are outlined and tabled below.

Holes	Priority					Total	Meterage Priority					Total

**Table 3. Seymour drill target priority and meterage**

Scheduling and prioritising of the exploration drilling targets will also be informed by current field exploration activities as the geologists methodically validate and rank targets.

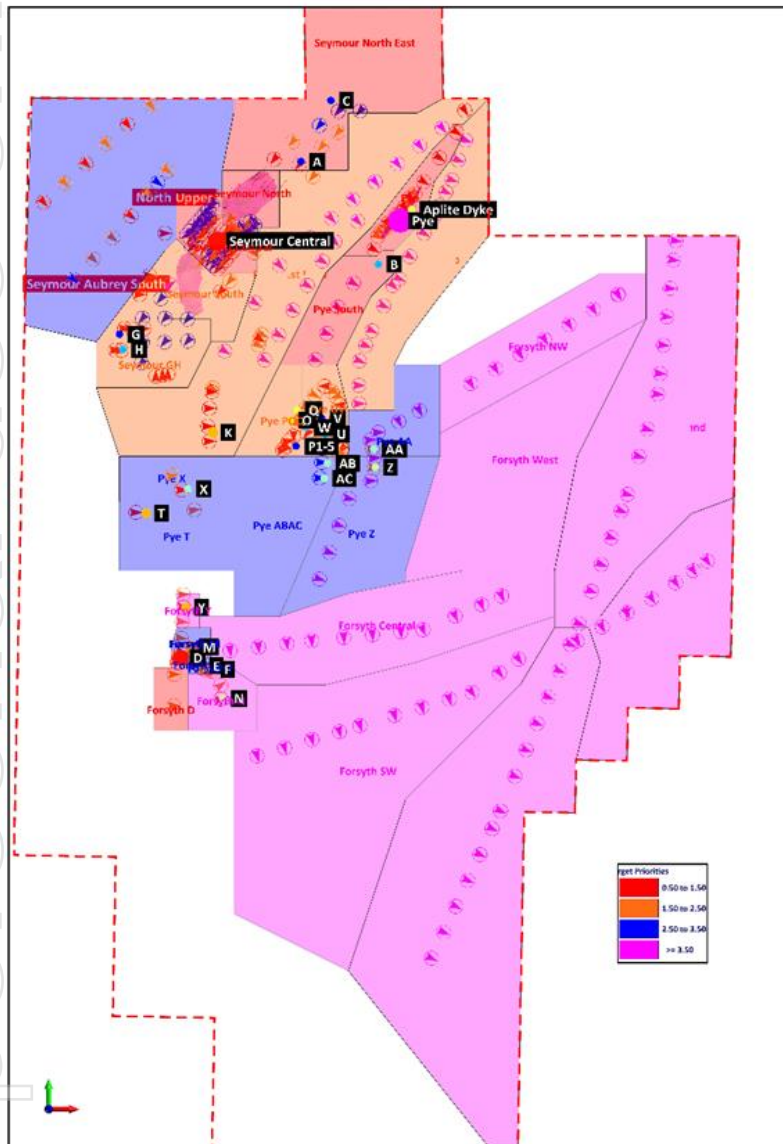

Figure 4. Preliminary drill collar (arrows) at Seymour, please note collars may move after site inspection.

Drilling at the **Pye prospect** (Phase 3 drilling) has also already commenced. Drilling through coming months here plans to test LCT-type pegmatites with geological continuity of over 250m identified in the initial few holes (see GT1 ASX release dated 19 May 2022) as well as an area up-strike (northeast) of the initial holes along the axial plane of a local synform.

## Seymour Mineral Resource Estimate details

### Regional Geology

The Seymour Lake Property occurs within the Superior Province of the Canadian Shield, proximal to the subprovincial boundary between the English River (north) and Wabigoon (south) subprovinces. Specifically, the Property is located within the Caribou Lake Greenstone Belt which trends east-northeast along the north shore of Lake Nipigon, extending eastward to the Onamon-Tashota Greenstone Belt (C. Jeffs 2018).

### Property Geology

Ontario government mapping shows the western part of the Property is underlain by mostly Willet Assemblage mafic volcanic-dominated rocks, with lesser units of Toronto Assemblage mafic volcanics, and minor Marshall Assemblage dacite tuffs and related sediments. The eastern part of the Property is underlain by a tonalite to granite to granodiorite pluton, thought to be the parental intrusion to the rare metal pegmatite dikes and sills exposed at the North and South Aubry showings. All Assemblages have been crosscut by felsic to mafic dikes of various ages and rock types, including the target pegmatite sills and dikes. The most volumetrically significant post-mineralization intrusive rocks are Proterozoic Nipigon mafic sills, which form the caps of the prominent “mesa-like” hills in the Lake Nipigon area (C. Jeffs 2018).

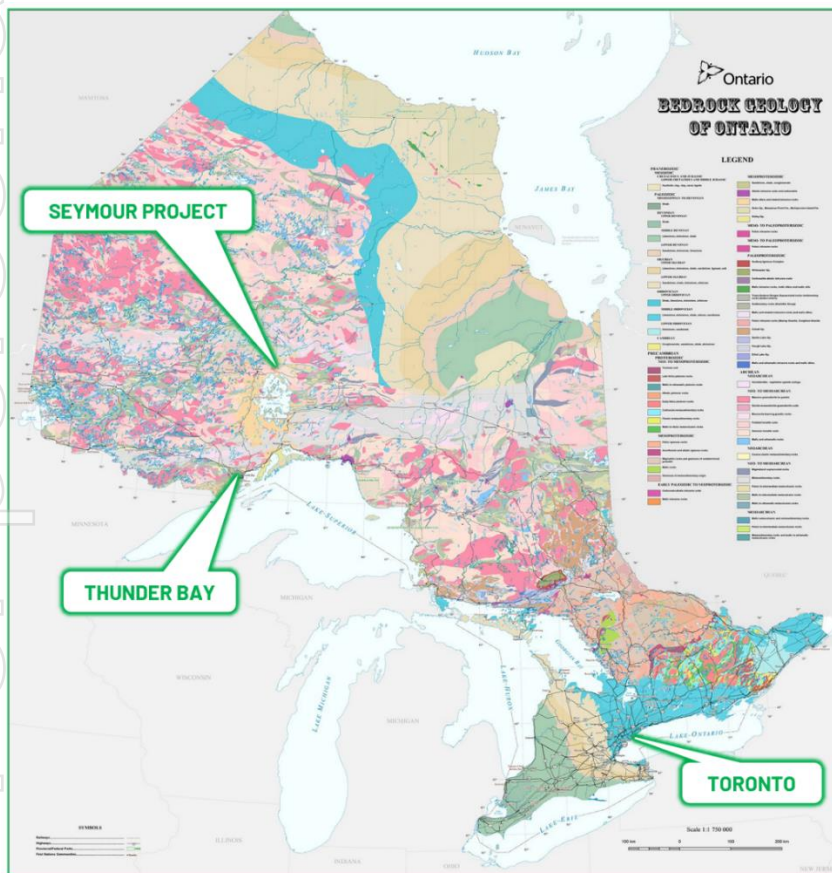

Figure 5: Geology Map of Ontario

## **Bedrock Geology**

The bedrock is best exposed along the flanks of steep-sided valleys scoured by glaciers during the recent ice ages. Glacial cover is patchy over the deposit and varies in thickness from zero to over 10m, but averages around 3m thickness.

There are four main lithologies within the Seymour Lake Project area. The eastern side of the project is dominated by Archean Granites. The southwest is mostly made up of a large elongate dolerite intrusions.

The central and northwest of the project area are dominated by a folded suite of meta-volcanics.

Based on geological mapping in the region the meta volcanics represent the metamorphosed amphibolite's and pillow basalt and intruded by dolerites and intercalated with volcanic-clastic sediments. Meta-sediments also occur in the far northwestern corner of the project area.

The Seymour Lake area is also crosscut by several north south trending dolerite dykes. These dykes likely follow pre-existing lines of weakness which may indicate faults.

The exposed bedrock is commonly metamorphosed basaltic rock, of which some varieties have well-preserved pillows that have been intensely flattened in areas of high tectonic strain. The rocks have been metamorphosed from greenschist to amphibolite grade and can include garnet and hornblende. Intercalated between layers of basalt are lesser amounts of schists derived from sedimentary rocks and lesser rocks having felsic volcanic protoliths. "These rocks are typical of the Wabigoon Subprovince, host to most of the pegmatites in the region", (after Phil Jones et al 2019).

## **Ore Geology**

Pegmatites are reasonably common in the region intruding the enclosing host rocks after metamorphism, evident from the manner in which the pegmatites cut across the well-developed foliation within the metamorphosed host rocks. This post-dating relationship is supported by radiometric dating; an age of 2666 ± 6 Ma is given for the timing of intrusion of the pegmatites (Breaks, et al., 2006).

The pegmatites in North Aubry have a north easterly plunge direction with a dip varying from 10 to 35 degrees from horizontal, up to 800m downdip extent and 250-350m strike. The North Upper and North Upper high-grade component, higher grade portion within, appears to wedge towards the southeast but is still open down dip and to the northwest.

Southern pegmatites are thinner and less well developed with higher muscovite and albite content and north-westerly trend and dip moderately to the east. These pegmatites are also hosted in pillow basalts.

The pegmatites are zoned with better developed spodumene crystal appearing as clusters, with radiating spodumene crystals often radiating in from the country rock contact.

The main ore bearing mineral is Spodumene, followed by minor Petalite and Lepidolite.

Associated minerals include quartz, muscovite, microcline, hornblende, albite and other feldspars, tourmaline, with minor carbonate, chlorite, biotite and hematite. Sulphide species are predominantly minor disseminated pyrite and trace pyrrhotite usually hosted by the surrounding basalt.

The updated Seymour Mineral Resource estimate was compiled by John Winterbottom, a fulltime employee of Green Technology Metals and a member of the Australasian Institute of Geoscientists. Mr Winterbottom has extensive experience in Mineral Resource estimation techniques and their application and worked in a wide range of spheres within the mining industry.

## Green Technology Metals (ASX:GT1)

GT1 is a North American focussed lithium exploration and development business. The Company's Ontario Lithium Projects comprise high-grade, hard rock spodumene assets (Seymour, Root and Wisa) and lithium exploration claims (Allison and Solstice) located on highly prospective Archean Greenstone tenure in north-west Ontario, Canada.

All sites are proximate to excellent existing infrastructure (including hydro power generation and transmission facilities), readily accessible by road, and with nearby rail delivering transport optionality.

Seymour has an existing Mineral Resource estimate of 9.9 Mt @ 1.04% Li<sub>2</sub>O. Accelerated, targeted exploration across all three projects delivers outstanding potential to grow resources rapidly and substantially.

The Company currently holds an 80% interest in the Ontario Lithium Projects (Seymour, Root and Wisa) under a joint venture with Ardiden Limited (ASX: ADV). Refer to the Company's Prospectus (see GT1 ASX release dated 8 November 2021) for further details.

## **APPENDIX A: IMPORTANT NOTICES**

### **Competent Person's Statements**

Information in this report relating to Exploration Results is based on information reviewed by Mr Luke Cox (Fellow AusIMM). Mr Cox has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Cox consents to the inclusion of the data in the form and context in which it appears in this release. Mr Cox is the Chief Executive Officer of the Company and holds securities in the Company.

Information in this report relating to Mineral Resource Estimation is based on information reviewed by Mr John Winterbottom (Member AIG). Mr Winterbottom has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Winterbottom consents to the inclusion of the data in the form and context in which it appears in this release. Mr Winterbottom is the General Manager of Technical Service for the Company and holds securities in the Company.

### **Forward Looking Statements**

Certain information in this document refers to the intentions of Green Technology Metals Limited (ASX: GT1), however these are not intended to be forecasts, forward looking statements or statements about the future matters for the purposes of the Corporations Act or any other applicable law. Statements regarding plans with respect to GT1's projects are forward looking statements and can generally be identified by the use of words such as 'project', 'foresee', 'plan', 'expect', 'aim', 'intend', 'anticipate', 'believe', 'estimate', 'may', 'should', 'will' or similar expressions. There can be no assurance that the GT1's plans for its projects will proceed as expected and there can be no assurance of future events which are subject to risk, uncertainties and other actions that may cause GT1's actual results, performance or achievements to differ from those referred to in this document. While the information contained in this document has been prepared in good faith, there can be given no assurance or guarantee that the occurrence of these events referred to in the document will occur as contemplated. Accordingly, to the maximum extent permitted by law, GT1 and any of its affiliates and their directors, officers, employees, agents and advisors disclaim any liability whether direct or indirect, express or limited, contractual, tortious, statutory or otherwise, in respect of, the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and do not make any representation or warranty, express or implied, as to the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and disclaim all responsibility and liability for these forward-looking statements (including, without limitation, liability for negligence).

## **APPENDIX B: SEYMOUR MRE – SUMMARY OF MATERIAL INFORMATION**

### **Geology and Geological Interpretation**

The Seymour deposit is located in northwest Ontario, Canada and lies within the Archean aged Superior Province approximately 2.5 billion years old largest portion of 3 major geological regions of the Precambrian Canadian Shield.

The shield forms the core of the North American continent and is surrounded by provinces of Paleoproterozoic age on the west, north and east, and Mesoproterozoic age (Grenville Province) on the southeast.

Proterozoic and younger activity is limited to rifting of the margins, emplacement of several mafic dyke swarms, compressional reactivation and large-scale rotation at circa 1.9 Ga, as well as failed rifting at circa 1.1 Ga. except for the northwestern Superior margin that was pervasively deformed and metamorphosed at approximately 1.8 Ga, the craton has escaped later ductile deformation.

Sedimentary rocks as old as 2.48 Ga uncomfortably overlie Superior Province granites, indicating that most erosion had occurred prior to circa 2.5 Ga (Percival and Easton 2007).

The Seymour Lake Lithium Project is often covered by recent glacial deposits comprising shallow gravelly soils, boulder till and in places thick moraines obscuring the bedrock, referred to as overburden in the mineral resource model. The overburden is generally thin, averaging 3m locally but can be absent completely or up to 10 or more metres thick. In low-lying areas the bedrock is also obscured by lakes and swamps.

The bedrock is best exposed along the flanks of steep-sided valleys scoured by glaciers during the recent ice-ages. The exposed bedrock is commonly metamorphosed basaltic rock, of which some varieties have well-preserved pillows that have been intensely flattened in areas of high tectonic strain. Intercalated between layers of basalt are lesser amounts of schists derived from sedimentary rocks and lesser rocks having felsic volcanic protoliths. These rocks are typical of the Wabigoon Subprovince hosting to most of the pegmatites in the region.

Pegmatites are reasonably common in the region intruding the enclosing host rocks after the host rocks were metamorphosed, evident from the manner in which the pegmatites cut across the well-developed foliation within the metamorphosed host rocks. This post-dating relationship is supported by radiometric dating; an age of 2666 ± 6 Ma is given for the timing of intrusion of the pegmatites (Breaks, Selway & Tindle, 2006).

### **Sampling and Sub-Sampling Techniques**

Available drill holes data were accumulated from multiple phases of drilling conducted by a number of operators from 2002 to 2009 by Linear, 2016-2018 by Ardiden Ltd and from 2021 by GT1 to the present.

Diamond drilling was used to obtain nominally 1m downhole samples of core.

Core samples were ½ cored using a diamond saw with ½ the core placed in numbered sample bags for assaying and the other half retained in sequence in the core tray. ½ core samples were approximately 2.5kg in weight with a minimum weight of 500grams. Core was cut down the apex of the core and the same a default side of the core selected for assaying to reduce potential sampling bias.

### **Drilling Techniques**

Tri-cone drilling was undertaken through the thin overburden prior to NQ or BTW diamond drilling through the primary rock. 11 holes were drilled by Ardiden using HQ core.

199 diamond core samples were used in the Mineral Resource estimate for 26,244.19 metres including 22 holes drilled by GT1 for 8,291.69m.

18 holes were rejected from the estimate mainly from 2009 and 2002 due to missing lithology logging and assay data or re-drills or poor orientation to the pegmatite attitude. Some of the earlier (2002) North Aubry holes were drilled vertically until it was realised the pegmatites plunged to the northeast. Most holes were drilled to the southwest approximately perpendicular to the pegmatite orientation.

## **Sample Analysis Method and QAQC**

All Ardiden and samples were analysed by AGAT for lithium and a suite of other elements, using Sodium Peroxide Fusion - ICP-OES/ICP-MS Finish (method# 201-378). Sodium Peroxide Fusion oxidizes samples at high temperatures effectively in dissolving all the pegmatite minerals while the ICP-MS ionizes chemical species and sorts the ions based on their mass-to-charge ratio.

All GT1 drill samples were submitted to Actlabs Thunder Bay for analysis for sample preparation before forwarding the pulps to their Ancaster laboratory in Ontario Canada for analysis using Sodium Peroxide Fusion - ICP-OES/ICP-MS Finish.

Prior to 2016 little QAQC was performed other than some duplicate core sampling and verification laboratory internal standards. Whilst the results appear acceptable the lack of QAQC was a concern.

A spatial sampling pairing review was undertaken comparing Ardiden and Linear samples located within 8m of each other within the pegmatite domains. The results were inconclusive but hinted at the Linear Li2O results being biased slightly lower than Ardidens results. It is unclear as to why this would be the case. As the Linear drilling makes up only 12% of the meterage included in the mineral resource the bias is not considered material to the estimate.

In 2016 Ardiden employed a single Li2O standard (CGL 128) certified by the Mongolian Central Geological Laboratory derived from the wolfram-lithium deposit located in the Arbyan area, Sukhbaatar province of Mongolia in April 2012. Ardiden used the standard from 2016 to 2018 until it was superseded by more reliable OREAS standards. The control charts produced over this time period for CGL 128 suggest occasional poor precision and a cluster of low grade assay returns. However, the OREAS standards, overlapping some of 2018 show no obvious bias and better precision from AGAT Laboratories

All the Ardiden drill samples were analysed by AGAT Laboratories who are accredited by The Standards Council of Canada (SCC), The Canadian Association for Laboratory Accreditation (CALA), SAI Global and have ISO/IEC 17025:2005 and ISO 9001:2015 accreditation.

All Ardiden samples were analysed by AGAT for lithium and a suite of other elements, using Sodium Peroxide Fusion - ICP-OES/ICP-MS Finish (method# 201-378). Sodium Peroxide Fusion oxidizes samples at high temperatures effectively in dissolving all the pegmatite minerals while the ICP-MS ionizes chemical species and sorts the ions based on their mass-to-charge ratio.

All GT1 drill samples were submitted to Actlabs, Thunder Bay for sample preparation before forwarding the pulps to their Ancaster laboratory in Ontario Canada for analysis using Sodium Peroxide Fusion - ICP-OES/ICP-MS Finish.

GT1 inserted certified lithium standards of varying grade and blanks into each batch submitted to Actlabs to monitor precision and bias performance at a rate of 1:20. Actlabs also inserted internal standards, blanks and pulp duplicates within each sample batch as part of their own internal monitoring of quality control.

All GT1 results were within acceptable tolerances.

No significant bias or precision issues were observed in the control samples.

## Estimation and Methodology

An Ordinary Kriging (OK) grade estimation methodology has been used for  $\text{Li}_2\text{O}$  and  $\text{Ta}_2\text{O}_5$  in the Mineral Resource Estimate which is considered appropriate for the style of mineralisation under review.

Geological units were first interpreted in Leapfrog 2021.2 software from geological logs and core photography references.

Pegmatite and overburden wireframes were exported from Leapfrog and then imported into Micromine for estimation.

Data was composited to 1m length to geological contacts.

Top cut analysis was carried out to identify extreme outliers, using a combination of plots, and histograms and the effect of top cuts on cut mean and coefficient of variation. Variable top cuts have been applied by domain and element but all elements had a fairly low coefficient of variation.

Two models were produced, North and South. The Northern model used blocks 5mE x 10mN x 2.5mRL rotated 45 from north to align with the long axis of the deposit. The Southern model used 10mE x 10m N x 2.5m RL block sizes with no rotation applied. Geological features were assigned to the model using sub-blocks upto 1/5 of the parent blocks to preserve pegmatite volumes.

The model was validated visually by comparing block grade estimate to composites values with confirmation through swath plots and statistical comparisons.

## Classification

The Mineral Resources have been classified as Indicated and Inferred based on drill spacing and geological continuity.

The Resource model uses a classification scheme based upon drill hole spacing plus block estimation parameters, number of composites, number of holes and average distance of data to block centroid in the respective search ellipsoid informing the block cell.

The results of the Mineral Resource Estimation reflect the views of the Competent Person.

**Figure 10: North and South Aubry Mineral Resource - Coloured by Resource classification**

## Cut-Off Grade and Other Parameters

The Seymour Mineral Resource is reported using open-pit mining constraints.

The open-pit Mineral Resource is only the portion of the resource that is constrained within a US\$4,000/t SC6 optimised shell and above a 0.2% Li<sub>2</sub>O cut-off grade. The optimised open pit shell was generated using:

- \$4/t mining cost
- \$15.19/t processing costs
- Mining loss of 5% with no mining dilution
- 55-degree pit slope angles
- 75% Product Recovery

## Mining and Metallurgical Assumptions

Mining and metallurgical factors are applied in determining the potential for economic extraction, however no mining or metallurgical factors have been applied to the resource estimate as reported.

Potential deleterious elements were estimated for North Aubry. The results show favourable downstream processing levels of low iron within the resource area as well as acceptable levels of other deleterious elements such as potassium.

<b>Mineral tenement and land tenure status</b>	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>Joint Venture between Green Technology Metals (ASX:GT1) 80% and Ardiden Ltd (ASX:ADV) 20%.</li> <li>Seymour Lithium Asset consists of 744 Cell Claims (Exploration Licences) with a total claim area of 15,058 ha.</li> <li>All Cell Claims are in good standing</li> <li>An Active Exploration Permit exists over the Seymour Lithium Assets</li> <li>An Early Exploration Agreement is current with the Whitesand First Nation who are supportive of GT1 exploration activities.</li> </ul>
<b>Exploration done by other parties</b>	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>Regional exploration for lithium deposits commenced in the 1950's. In 1957, local prospector, Mr Nelson Aubry, discovered the North Aubry and the South Aubry pegmatites.</li> <li>Geological mapping by the Ontario Department of Mines commenced in 1959 and was completed in 1962 (Pye, 1968), with the publication of "Map 2100 Crescent Lake Area" in 1965.</li> <li>From the late 1950's to 2002, exploration by the Ontario Department of Mines was generally restricted to geological mapping and surface sampling, although some minor drilling was completed to test the North Aubry pegmatite in late 1957 (Rees, 2011).</li> <li>In 2001, Linear Resources Inc. ("Linear Resources") obtained the Seymour Lake Project with an initial focus on the project's tantalum potential. In 2002, a 23-diamond drill-hole campaign was completed at North Aubry, and a further 8 diamond drill-holes at South Aubry.</li> <li>In 2008, Linear Resources completed a regional soil-sampling program which resulted in the identification of a number soil geochemical anomalies. Based on these anomalies, another drilling campaign (completed in 2009), with 12 diamond drill-holes at North Aubry, 2 diamond drill-holes at South Aubry, and further 5 diamond drill-holes peripheral to the Aubry prospects designed to test the main 2008 soil geochemical</li> </ul>

Criteria	JORC Code explanation	Commentary
		<p>anomalies.</p> <ul style="list-style-type: none"> <li>Little work was undertaken between 2010 and 2016 until Ardiden acquired the project from Linear Resources in 2016. Further drilling was carried out by Ardiden between 2017 and 2018 resulting in the completion of an updated mineral resource estimate of the Aubry pegmatites in 2018. Ground Penetrating Radar (GPR) was also undertaken by Ardiden in 2018 to test any further exploration potential beyond the current Aubry pegmatite delineating numerous targets.</li> </ul>
<p><b>Geology</b></p>	<ul style="list-style-type: none"> <li><i>Deposit type, geological setting and style of mineralisation.</i></li> </ul>	<ul style="list-style-type: none"> <li><b>Regional Geology:</b> The general geological setting of the Seymour Lithium Asset consists of the Precambrian Canadian Shield that underlies approximately 60% of Ontario. The Shield can be divided into three major geological and physiographic regions, from the oldest in the northwest to the youngest in the southeast.</li> <li><b>Local Geology:</b> The Seymour Lithium Asset is located within the eastern part of the Wabigoon Subprovince, near the boundary with the English River Subprovince to the north. These subprovinces are part of the Superior Craton, comprised mainly of Archaean rocks but also containing some Mesoproterozoic rocks such as the Nipigon Diabase.</li> <li><b>Bedrock Geology:</b> The bedrock is best exposed along the flanks of steep-sided valleys scoured by glaciers during the recent ice ages. The exposed bedrock is commonly metamorphosed basaltic rock, of which some varieties have well-preserved pillows that have been intensely flattened in areas of high tectonic strain. Intercalated between layers of basalt are lesser amounts of schists derived from sedimentary rocks and lesser rocks having felsic volcanic protoliths. These rocks are typical of the Wabigoon Subprovince, host to most of the pegmatites in the region.</li> <li><b>Ore Geology:</b> Pegmatites are reasonably common in the region intruding the enclosing host rocks after metamorphism, evident from the manner in which the pegmatites cut across the well developed foliation within the metamorphosed host rocks. This post-dating relationship is supported by radiometric dating; an age of 2666 ± 6 Ma is given for the timing of intrusion of the pegmatites (Breaks, et al., 2006).</li> <li>The pegmatites in North Aubry have a northeast plunge direction varying from 10 to 35 degrees from horizontal some 800m downdip extent and 250-300m strike. The North Upper and North Upper high grade component</li> </ul>

Criteria	JORC Code explanation	Commentary																																																																																																																																																																																																																																																																					
		<p>within, appears to wedge towards the south east and is still open down dip and to the north west.</p> <ul style="list-style-type: none"> <li>Southern pegmatites are thinner and less well developed with higher muscovite content and appear to have a more north to north-westerly trend and dip more shallowly to the east. These pegmatites are also hosted in pillow basalts.</li> <li>The pegmatites are zoned with better developed spodumene crystal appearing as bands, often at an acute angle to the general trend of the pegmatite.</li> <li>The dominant economic minerals are spodumene with varying proportions of muscovite, microcline, and minor petalite and lepidolite.</li> <li>The adjacent pillow basalts contain minor disseminated pyrite and pyrrhotite.</li> </ul>																																																																																																																																																																																																																																																																					
<b>Drill hole Information</b>	<ul style="list-style-type: none"> <li>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar</li> <li>elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar</li> <li>dip and azimuth of the hole</li> <li>down hole length and interception depth</li> <li>hole length.</li> </ul> </li> <li>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>A total of 199 diamond holes, on a nominal 20m x 20m grid, have been used in the resource modelling at North Aubry and South Aubry. <b>Further work</b>	<ul style="list-style-type: none"> <li>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</li> <li>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</li> </ul>	<ul style="list-style-type: none"> <li>Test further potential downdip extensions and pegmatite stacking at North Aubry.</li> <li>Drilling program commencement at Root and Morssion prospects.</li> <li>Geological field mapping of anomalies and associated pegmatites at Seymour and regional claims.</li> <li>Sampling pegmatites for spodumene</li> <li>Drill targeting and followed by diamond drilling over the next 24 months.</li> <li>Commencement of detailed mining studies</li> </ul>

## Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

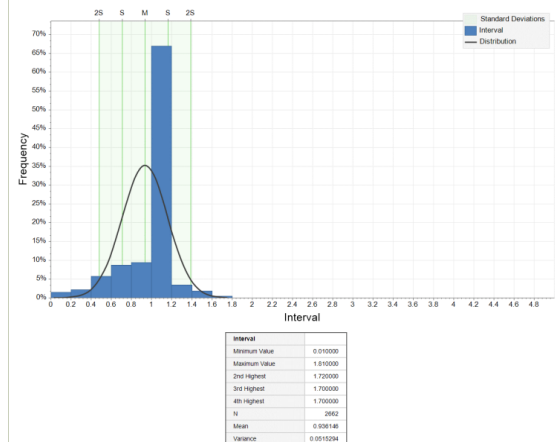

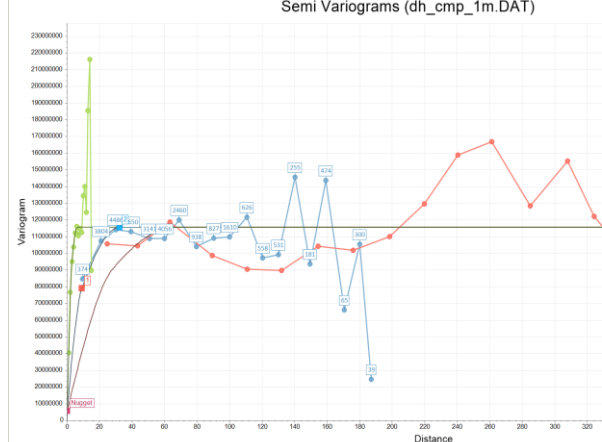

Criteria	JORC Code explanation	Commentary
<b>Database integrity</b>	<ul style="list-style-type: none"> <li>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</li> <li>Data validation procedures used.</li> </ul>	<ul style="list-style-type: none"> <li>Data was imported into the database directly from source geology logs and laboratory csv files. Was then passed through a series of validation checks before final acceptance of the data for downstream use.</li> </ul>
<b>Site visits</b>	<ul style="list-style-type: none"> <li>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</li> <li>If no site visits have been undertaken indicate why this is the case.</li> </ul>	<ul style="list-style-type: none"> <li>A site visit was undertaken by the Competent Person (John Winterbottom) between 8th and 9th June 2022; general site layout, drilling sites, diamond drilling operations were viewed, plus diamond core in the storage facility Thunder Bay.</li> </ul>
<b>Geological interpretation</b>	<ul style="list-style-type: none"> <li>Confidence in (or conversely, the uncertainty of ) the geological interpretation of the mineral deposit.</li> <li>Nature of the data used and of any assumptions made.</li> <li>The effect, if any, of alternative interpretations on Mineral Resource estimation.</li> <li>The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade and geology.</li> </ul>	<ul style="list-style-type: none"> <li>There is good confidence in the geological interpretation of the deposit in most areas; there are some areas of uncertainty at the outer limits of the deposit where drill spacing is sparse.</li> <li>Interpretation was made directly from pegmatites noted in geological logs and confirmation through core photographs.</li> <li>Alternative geological interpretation would have a minimal effect on the resource estimate.</li> <li>Pegmatite intrusions were used to constrain the mineral resource estimation.</li> <li>Continuity of grade and geology is strongly tied to pegmatite</li> </ul>

Criteria	JORC Code explanation	Commentary
<p><b>Dimensions</b></p>	<ul style="list-style-type: none"> <li>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.</li> </ul>	<p>thickness that varies considerably throughout the deposit due to structural elongation and dilation dynamics.</p> <ul style="list-style-type: none"> <li>The deposit consists of a number of stacked pegmatite units of varying thicknesses.</li> <li>The deposit consists of two principal areas North and South</li> <li>The Northern area of the deposit has a maximum horizontal extent of 800m, 390m wide and varies from 2m up to 43m in thickness. 5 mineralised pegmatites that have been interpreted down to a depth of 350m below surface and is still open at depth. Pegmatites dip approximately 30-35 degrees to the northeast.</li> <li>The Southern area consists of an Upper and a Lower pegmatite. The Upper pegmatite is continuous over the entire extent of the Southern deposit whilst the Lower pegmatite is broken into a northern and southern half. The Southern area extends upto 740m along a 330 strike direction, upto 170m across with thickness varying from 0 to 22m, with a maximum depth of 130m below surface.</li> </ul>

<b>Moisture</b>	<ul style="list-style-type: none"> <li>Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.</li> </ul>	<ul style="list-style-type: none"> <li>Tonnages are estimated on a dry basis</li> </ul>
<b>Cut-off parameters</b>	<ul style="list-style-type: none"> <li>The basis of the adopted cut-off grade(s) or quality parameters applied.</li> </ul>	<p>The Seymour Mineral Resource is reported using open-pit mining constraints.</p> <p>The open-pit Mineral Resource is only the portion of the resource that is constrained within a US\$4,000 / t SC6 optimised shell and above a 0.2% Li<sub>2</sub>O cut-off grade. The optimised open pit shell was generated using:</p> <ul style="list-style-type: none"> <li>\$4/t mining cost</li> <li>\$15.19/t processing costs</li> <li>Mining loss of 5% with no mining dilution</li> <li>55 degree pit slope angles</li> <li>75% Product Recovery</li> </ul>
<b>Mining factors or assumptions</b>	<ul style="list-style-type: none"> <li>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>The 2022 Mineral Resource Estimate is reported above 0.2% Li<sub>2</sub>O cut-off. The cut-off is based on lowest potential grade at which a saleable product might be extracted using a conventional DMS and / or flotation plant and employing a TOMRA Xray sorter (or equivalent) on the plant feed.</li> <li>A number of pegmatites outcrop at surface thus the mineral resource is likely to be extracted using a conventional drill and blast, haul and dump mining fleet.</li> </ul>
<b>Metallurgical factors or assumptions</b>	<ul style="list-style-type: none"> <li>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</li> </ul>	<p><b>Metallurgical Dense Media Cyclone Separation (DMCS)</b> work was carried out by Ardiden as follows:</p> <ul style="list-style-type: none"> <li>Ardiden's Chinese strategic partner, Yantai Jinyuan Mining Machinery Co. Ltd., carried out metallurgical test work on a 2,500 kg bulk sample collected using a large rock breaker and excavator from a trench at Aubry North. Using this equipment to collect the bulk sample avoided problems associated with natural particle size distribution (PSD) as a result of drilling and blasting.</li> <li>After mining, the large rocks were hand broken and homogenised, then using a number of highly controlled staged crushing and sample preparation procedures Yantai generated a 500 kg sample of &lt;6 mm particles, which is a typical size range for lithium chemical plants. The crushed head sample size distribution of the particles achieved was 86.5% ranging from 0.5 mm to 6.0 mm at an average head grade of 1.37% Li<sub>2</sub>O and 13.5% of the particles &lt;0.5mm at an average head grade of 0.84% Li<sub>2</sub>O. The overall average head grade was 1.29% Li<sub>2</sub>O.</li> </ul>

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> <li>The coarse particle size used for the testing showed that crushed ore, without using a roller crusher, reduces the crushing and processing times and costs while still producing a high quality marketable lithium concentrate.</li> <li>Heavy Liquid Separation (HLS)</li> <li>The HLS tests on the North Aubry pegmatite material showed that, with a heavy liquid density of 2.95g/ml, a very impressive spodumene concentrate of up to 7.04% Li<sub>2</sub>O at a recovery of 91.6% is produced. Detailed metallurgical studies have only just begun but preliminary metallurgical test work undertaken by IMO in Perth Western Australia on behalf of Ardiden Ltd in April and again in December 2017 suggest a 2 phase Dense Media Separation processing plant may be sufficient to achieve acceptable spodumene recoveries.</li> </ul> <p><b>Dense Media Cyclone Separation (DMCS)</b></p> <ul style="list-style-type: none"> <li>Dense Media Cyclone mineral separation tests were conducted under a number of different operating conditions on the 0.5mm to 6mm size fraction only. This testwork indicated that a lithium concentrate grade of 6.05% Li<sub>2</sub>O can be achieved at a recovery rate of 85.6%. It was noted that should it be needed, the lithium concentrate grades can be improved with an increase in feed pressure but at the cost of recovery rate.</li> <li>Different medium densities were also tested with one lithium concentrate producing a grade of 6.92% Li<sub>2</sub>O with a strong recovery rate of 81.7%. The most encouraging results occurred when using: <ul style="list-style-type: none"> <li>Feeding density of 2400kg/m;</li> <li>Ore feeding pressure 0.045Mpa;</li> <li>Ratio of ore and medium at 1:6; and</li> <li>Feed size of 0.5mm to 6.0mm.</li> </ul> </li> </ul> <p><b>Metallurgical Testwork Conclusions</b></p> <p>Ardiden concluded the following from their testwork:</p> <ul style="list-style-type: none"> <li>It was concluded from this initial metallurgical testwork that gravity separation is a viable method of producing a high grade commercial lithium concentrate from Seymour Lake pegmatites. The North Aubry spodumene concentrate quality appears to contain only traces amounts of deleterious minerals. The North Aubry spodumene appears to have a low iron content which will positively impact down-stream processing hence enhancing the commercial value of the lithium concentrate produced.</li> </ul>

For personal use only

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> <li>HLS tests produced high-grade lithium concentrates up to 7.04% Li<sub>2</sub>O at a recovery rate of 91.6%.</li> <li>GT1 intends to undertake further, more exhaustive testwork, has now commenced with fresh samples taken from historic and recent diamond core samples for HLS variability testwork, HMS, flotation and pilot testwork.</li> </ul>
<b>Environmental factors or assumptions</b>	<ul style="list-style-type: none"> <li>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</li> </ul>	<ul style="list-style-type: none"> <li>Waste rock characterization work has begun but was not far enough advanced for inclusion in this report at the time of writing.</li> <li>Some sulphur results are available from assaying of diamond core with low level Sulphur haloing observed several metres adjacent to the pegmatite contacts.</li> <li>More exhaustive waste rock testing is currently underway in order to be able to characterise all the waste rock types and their likely environmental impacts.</li> <li>Diamond core samples over the entire North Aubry deposit on a semi regular grid have been selected and submitted for multi-elemental, including Nickel and Sulphur, testwork to Actlabs in Thunder Bay Ontario.</li> </ul>
<b>Bulk density</b>	<ul style="list-style-type: none"> <li>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</li> <li>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</li> <li>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</li> </ul>	<ul style="list-style-type: none"> <li>1, 518 density measurements exist in the database of which 226 are from recent water immersion testwork undertaken by Actlabs Thunder Bay Ontario on ½ NQ core samples with intervals consistent with the assay intervals submitted to the laboratory (nominally 1m). 1181 results are from laboratory pycnometer tests and the remainder are unrecorded. No obvious bias was noted between the measurements based on method, however samples whose test method was not recorded were excluded from the data analysis process. These were typically older samples with unknown test conditions applied.</li> <li>Previous mineral resource estimates have determined pegmatite bulk densities of 2.78 and country rock, mainly meta-basalts, to be approximately 3.0. 698 density measurement are within the interpreted pegmatite boundaries the bulk within the North Upper HG domain. This domain confirmed previous bulk density values of 2.78. Fresh waste rocks averaged 3.0 consistent with basalt and sediment averages.</li> <li>No bulk density data is available for the largely glacial cover over the deposit due to the difficulty in recovering this material in the drilling process. This material is volumetrically negligible ranging in depths from 0 to 14m and averaging around 3m. An assumed bulk density of 2.2 was used for overburden.</li> </ul>
