ASX ANNOUNCEMENT

13 September 2022

TERMS AGREED OVER THE HORDEN LAKE COPPER-NICKEL-PGM DEPOSIT IN QUEBEC, CANADA

Rafaella Resources Limited (ASX:RFR) ('Rafaella' or the 'Company') announces that terms have been agreed for the acquisition of the impressive Horden Lake polymetallic/battery metals deposit in north-western Quebec, Canada.

The Company, through its 100% owned subsidiary 9426-9198 Québec Inc., ('RFR Quebec') has signed a binding agreement with Gestion Ora-Mirage Ltée to acquire the Horden Lake polymetallic deposit ('Horden Lake', or the 'Project'). Horden Lake is an advanced project located approximately 140 km north of the mining town of Matagami, and 300km north of the Company's wholly owned Belleterre-Angliers Cu-Ni-PGM project, also in Quebec. The Horden Lake deposit is centrally located within the 815-hectare tenement package being acquired and is comprised of 18 separate claims, all in good standing (see Fig. 2).

Highlights

- ✓ Rafaella to acquire 100% of the Horden Lake battery metals project for C\$4m.
- ✓ Acquisition financing is secured for up to A\$2m (at RFR's discretion) in binding commitments, with other significant late-stage discussions ongoing. An upfront deposit of C\$400k has been paid from existing cash resources.
- ✓ NI43-101 (2009) compliant resource of **16.55Mt comprising 8.76Mt of Indicated @ 0.88% Cu, 0.21% Ni, and 7.79Mt of Inferred at 0.87% Cu, 0.25% Ni.**
- ✓ Metallurgical studies by the International Nickel Company of Canada ('INCO') yielded excellent recoveries.
- ✓ In-fill drilling is planned to better quantify the known Co, Pd, Pt, Au and Ag contents and upgrade Inferred resource categories to Indicated in advance of a PFS.
- ✓ Close to infrastructure, notably a new road and power line connecting the mining town of Matagami to the La Grande hydroelectric power dam (see Fig.1).
- ✓ The Horden Lake project is complementary to the Company's existing Belleterre-Angliers exploration project, also held by RFR Quebec, which now holds a substantial battery metals portfolio in a Tier 1 mining jurisdiction.

Cautionary Statement

The estimates of Mineral Resources are not reported in accordance with the JORC Code 2012; a Competent Person has not done sufficient work to classify the estimates of Mineral Resources or Ore Reserves in accordance with the JORC Code 2012. It is possible that following evaluation and/or further exploration work the currently reported estimates may materially change and hence will need to be reported afresh under and in accordance with the JORC Code 2012. Nothing has come to the attention of the Company that causes it to question the accuracy or reliability of the former owner's estimates, but the acquirer has not independently validated the former owners' estimates and therefore is not to be regarded as reporting, adopting or endorsing those estimates. Please refer to Appendix B.

Managing Director, Steven Turner said: "The acquisition of the Horden Lake deposit will be, once completed, truly and immediately transformative for the Company. It adds an outstanding battery metals flagship with a substantial Cu-Ni deposit to the current Canadian battery metal property portfolio. The acquisition substantially boosts Rafaella's battery metals position in Canada.

The Horden Lake property offers significant short-term upside through a program to update the resource estimate with immediate in-fill drilling that will also quantify the additional high-value precious metals and cobalt credits available. The resource will be re-assessed in relation to the higher commodity price environment that is reflective of the growing demand for these battery metals. The Horden Lake deposit is now located close to upgraded and improved infrastructure (both road and power) and benefits from having a significant amount of known resource tonnage located close to surface.

The recent acquisition by Archer Exploration (announced 13 July 2022) of the nearby Le Grasset Cu-Ni deposit (see Fig.1) for C\$53.6m is an example of the potential value of these high-grade battery metal deposits in Quebec.”

Background and Opportunity

The Horden Lake deposit was discovered by INCO in the 1960s. Between 1962 and 1969, INCO completed geophysics and 157 holes for a total of 32,229m. At the time the project was remote with access only possible via float plane or helicopter. INCO focused solely on the nickel and copper content, without assaying for other metals, and given the difficult access, metal prices, and its primary focus on the Sudbury region, did not proceed.

In 2008, Southampton Ventures Inc. conducted geophysics and drilling (18,136m over 73 holes) and assayed some holes for metals other than copper and nickel. A 43-101 compliant mineral resource estimate was prepared by Caracle Creek International Consulting Inc. dated 15 April 2009. This was followed by a further 2,037m drilled over 12 holes by El Condor Minerals Inc. in 2012⁽³⁾, of which all 12 were assayed for Co, Pd, Pt, Au and Ag as potential by-products.

Fundamental changes in the world economies as they transition to renewable energy, has seen commodity prices of battery metals rise. Previous owners have not focused on the range of by-product credits available, with cobalt and PGMs, in particular, being overlooked. With the construction in the 1980s of the Route Billy-Diamond Highway, a major road linking Matagami and the Le Grande Hydroelectric Power Dam to the north, along with associated power lines, the deposit now benefits from key infrastructure passing within 18km of the property. These developments have transformed the Horden Lake deposit into a valuable project at a time that both the Canadian and Quebec governments are actively promoting the development of such critical deposits.

Figure 1: Location Map of Rafarella's Canadian Battery Metals Portfolio

The Horden Lake Resource

In April of 2009 an independent technical resource estimate was completed on the Horden Lake Property by Caracle Creek International Consulting Inc. for Southampton Ventures Inc. ('**Horden Lake Technical Report**')⁽¹⁾. The mineral resources disclosed in the National Instrument 43-101 Technical Report conformed to the Canadian Institute of Mining, Metallurgy and Petroleum (CIM) standards on Mineral Resources and Reserves as adopted by the CIM Council on December 11, 2005. The Horden Lake Technical Report may be found at <https://sedar.com/DisplayCompanyDocuments.do?lang=EN&issuerNo=00021766> in the announcement dated 15 April, 2009.

The result of this resource estimate using a 0.5% Cu Block Cut off are as follows⁽¹⁾:

Category	Tonnes	Cu%	Ni %	g Pd/t	g Au/t	g Ag /t
Indicated	8,759,200	0.88	0.21	0.15	0.15	10.44
Inferred	7,791,195	0.87	0.25			

Cautionary Statement

The estimates of Mineral Resources are not reported in accordance with the JORC Code 2012; a Competent Person has not done sufficient work to classify the estimates of Mineral Resources or Ore Reserves in accordance with the JORC Code 2012. It is possible that following evaluation and/or further exploration work the currently reported estimates may materially change and hence will need to be reported afresh under and in accordance with the JORC Code 2012. Nothing has come to the attention of the Company that causes it to question the accuracy or reliability

of the former owner's estimates but the acquirer has not independently validated the former owners' estimates and therefore is not to be regarded as reporting, adopting or endorsing those estimates. Please refer to Appendix B.

The Horden Lake deposit is contained within the claims area that is subject to the acquisition, as illustrated below.

Figure 2: Horden Lake Deposit shown in context of the acquired claims

One of the INCO cross sections from Horden Lake is shown in Figures 3 and 4 below and illustrates the attractiveness of the deposit with consistent high-grade intersections and significant amount of near surface mineralisation.

Figure 3: INCO cross section and location of El Condor drill holes shown in relation to the claims map. ⁽⁵⁾ Refer to Tables 1 to 4 for drill hole details.

Figure 4: INCO cross sections demonstrating typical geology and mineralized zone.⁽⁵⁾
Refer to Tables 3 and 4 later in this announcement for drill hole details.

The 2,037m drilled over 12 holes by El Condor Minerals Inc. in 2012 (shown in figure 3) are not included in the Horden Lake Technical Report and resource estimation. Assay results from this program further demonstrated the potential for substantial credits arising from cobalt, gold, silver, and palladium.

Table 1 and 2 below give details on the first four of the twelve El Condor drill hole results that have been reviewed for JORC compliance and signed off thus far by Rafaella's Competent Person. Work is ongoing with the data set and the Company will update the market as the remaining drill hole data is reviewed under the JORC Code guidelines.

Source: 2012-05-15 El Condor Minerals Inc. news release ⁽³⁾;

Further investigation of the potential by-product/co-product upside will be a focus for the Company following completion of the acquisition.

The deposit has been modelled with over 50,000m of drilling and remains open at depth and along strike. The wireframe model consists of two zones: Zone 1 and Zone 2. These zones were modelled on section intervals of approximately 50m. Zone 1, the larger zone, extends for 1,500m of strike length and has an average thickness of 19m. The smaller Zone 2 in the hanging wall of, and parallel to, Zone 1 has a strike length of approximately 290m. A 3D view of the block model developed can be seen in the accompanying Figure 5.

Figure 5: 3-D view from NE of Cu Zone of the Horden Lake Deposit (based on 0.5% block cut off).
Extracted from the Horden Lake Technical Report ⁽¹⁾.

Importantly, the grade-tonnage curve (Figure 6) indicates substantial tonnage upside for the resource, considering the higher commodity price environment and the inclusion of additional by-product credits, both of which could allow for a possible lower cut-off grade.

Figure 6: Grade-tonnage curve for the Horden Lake deposit. Extracted from the Horden Lake Technical Report ⁽¹⁾

Geological Discussion of the Horden Lake Deposit

The Horden Lake property is in the Nemiscau Subprovince, close to the border with the Opatica Subprovince all within the Superior Province of the Canadian Shield. This area is characterized by metasedimentary and volcano-plutonic rocks that are transected by east-west and northeast-southwest shear zones. The rocks are metamorphosed to greenschist facies and locally to amphibolite facies (Figure 7).

Figure 7: Regional Geology Frotet-Evans Greenstone Belt Opatica Subprovince. Extracted from Caracle Creek NI 43-101 Report ⁽¹⁾

The local geology on the Horden Lake property consists of metavolcanic and metasedimentary rocks. Also present is concordant metagabbro intrusive with inclusions of metasedimentary rocks. Granites intruded the metasedimentary and metavolcanic package, and the granites are cut by later granitic dykes and pegmatites. The youngest rocks in the area are gabbro and diabase dykes. Structurally, the rocks have an EW, NE and NW and dip and dip steeply to the south (as seen in Figure 4).

The Horden Lake deposit is a magmatic nickel copper (PGM) deposit associated with mafic and ultramafic rocks. These deposits commonly occur as massive bodies or disseminations along the contacts of mafic to ultramafic intrusions. Mineralisation on the Horden Lake property consists of various mineral types. The main mineralised zone, or the "INCO" horizon, is a conductive sulphide rich zone that is 1 to 30m wide and 1,950m long. This zone strikes NE and dips 50-60 degrees west and is present along the gabbro sedimentary contact. The dominant sulphides in this horizon are pyrrhotite, pyrite and chalcopyrite. Other mineralization styles include blebby pyrrhotite and chalcopyrite in gabbro and blebs and disseminations of pyrrhotite and chalcopyrite in shear zones at the contact between the metasedimentary rocks and gabbro.

Acquisition and Funding

A binding agreement dated 2 September 2022 for the acquisition of the Horden Lake Deposit has been executed with Gestion Ora-Mirage Ltée ('Seller') with the following terms:

- Consideration of C\$4 million, with an initial payment (already settled) of C\$400,000 non-refundable deposit (other than for material breach by the Vendor), followed by the balance within 90 days from signing.
- Vendor to retain a 1% net smelter return.
- Acquisition is by the wholly owned subsidiary, RFR Quebec, of 18 claims covering the Horden Lake deposit. RFR Quebec is the holder of the Belleterre-Angliers exploration project and hence offers an efficient structure for the future deployment of capital to fund the Quebec battery metals portfolio.

Binding commitments for almost 50% of the consideration (subject to prevailing exchange rates at the time of closing) have been secured by the Company, thereby materially mitigating the funding risk, through:

- a A\$1 million equity placement commitment with Starboard Global Limited and associated co-investors at a 50% premium to the 10-day Rafaella share price Volume Weighted Average Price ('VWAP') prior to this announcement, or A\$0.035 per share (whichever is lower), with a minimum drawdown of A\$500,000 (equating to 14,285,714 shares at \$0.035/share). Having sufficient capacities to issue the shares is a condition precedent to drawdown, along with the payment of the deposit. (*Dr Robert Wrixon, a director of Rafaella, is also a director of Starboard Global Limited and an intended participant in this placement*). The Company will seek any approvals required under ASX Listing Rule 10.11 in connection with the Starboard Global Limited equity placement commitment; and
- a A\$1 million convertible bridge loan note executed with Riverfort Global Capital Ltd. The loan note may, or may not, be drawn (at Rafaella's option) in A\$500,000 tranches. Should the facility be drawn, then the detailed terms are set out in Appendix A.

The Board has assessed the financing terms of the two committed facilities above and has determined that the facilities are market competitive, and fair and equitable for shareholders.

Discussions are well underway with several parties to finance the consideration, and subsequent project development. Funding options being explored include both equity and debt instruments. Depending upon which funding options the Board determines are most favourable, the two existing commitments may or may not form part of the final funding package. Once the final funding package is determined, the Company will announce the details and seek any necessary shareholder approvals. The Company currently has insufficient capacities to issue securities to meet the conditions precedents for the two facilities. Based on current commitments, a further C\$2,000,000 in equity may need to be raised for which there are currently insufficient capacities. To meet any required capacity requirements, ASX Listing Rule 7.1 approval will be sought from shareholders prior to draw down.

If the Company is not able to raise the balance of the consideration, then the deposit will be forfeited. No other liabilities remain.

About Rafaella Resources

Rafaella Resources Limited (ASX:RFR) is an explorer and developer of world-class mineral deposits. Rafaella holds a battery metals exploration portfolio in Canada located within the prolific Belleterre-Angliers Greenstone Belt comprised of the Midrim, Laforce, Alotta and Lorraine high-grade nickel copper PGM sulphide projects in Quebec (together the '**Belleterre-Angliers Project**'). These projects are now complemented by the flagship Horden Lake property, subject to a binding acquisition agreement, which contains a significant copper-nickel-PGM-gold-silver metal resource. The combination of these projects offers significant upside for the Company shareholders in a supportive mining jurisdiction as modern economies look to transition to renewables.

Rafaella also owns the Santa Comba and San Finx tungsten and tin development projects in Spain. The recently acquired San Finx project lies 50km south from the Company's Santa Comba tungsten and tin mine in Galicia, NW Spain, all within the same geological belt, strengthening the Company's strategic position in the Iberian Peninsula and its long-term goal of being a significant supplier of the critically listed metals of tungsten and tin.

Competent Person Statement

Technical information in this press release that relates to Exploration Results has been extracted from various reports presented and has been reviewed by John Gorham, P. Geol. of Dahrouge Geological Consulting Ltd., who has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the JORC Code. Mr. Gorham has not independently verified this information for quality control or quality assurance nor been to the Horden Lake site. Mr. Gorham is a member of the Association of Professional Engineers and Geoscientists of Alberta. Mr. Gorham consents to the inclusion in this report of the matters based on his information in the form and context in which it appears.

Mineral Resources

Information in this announcement that relates to the mineral resource estimate for the Horden Lake Deposit has been reported by Southampton Ventures Inc., under National Instrument 43-101 Technical Report conformed to the Canadian Institute of Mining, Metallurgy and Petroleum (CIM) standards on Mineral Resources and Reserves as adopted by the CIM Council on December 11, 2005. The Company has no reason to doubt the reliability of these estimates. Mr. John Gorham, a Competent Person who is a member of the Association of Professional Engineers and Geoscientists of Alberta, and therefore considered a Competent Person for the purposes of JORC reporting standards, considers that the information in this announcement is an accurate representation of the available data and studies for the mining project. Nothing has come to the Company's attention that causes the Company to question the accuracy or reliability of these estimates. The Company considers that the information in this announcement is an accurate representation of the available data and studies for the mining project. However, the Company has not independently validated these estimates and therefore this announcement is not to be regarded as reporting, adopting or endorsing those estimates. The information is being provided for the purpose of practical, fulsome disclosure

Forward Looking Statements Disclaimer

This announcement contains forward-looking statements that involve a number of risks and uncertainties. These forward-looking statements are expressed in good faith and believed to have a reasonable basis. These statements reflect current expectations, intentions or strategies regarding the future and assumptions based on currently available information. Should one or more of the risks or uncertainties materialise, or should underlying assumptions prove incorrect, actual results may vary from the expectations, intentions and strategies described in this announcement. No obligation is assumed to update forward looking statements if these beliefs, opinions, and estimates should change or to reflect other future developments.

Appendix A Riverfort Global Capital Ltd Loan Note Material Terms

The convertible bridge loan note ('**Loan Note**'), once drawn, may be converted at Riverfort Global Capital Ltd.'s ('**Lender**') option at a 50% premium ('**Premium Placement Price**') to the 5-day Rafaella share price VWAP prior to this announcement ('**Closing Price**'), or repaid within 90 days ('**Repayment Date**'), plus accrued interest (being 8%) and fees (comprising 3.75% implementation fee (payable in cash upon each tranche draw down),

Draw down is conditional upon:

- satisfactory completion of Lender due diligence process, documentation and having sufficient capacities to issue the shares in the event of early conversion,
- The second tranche is available for drawdown subject to the aggregate outstanding plus interest, post drawdown of tranche 2, being less than a 20x multiple to the 10 and 30-day daily volume of weighted average price ('**VWAP**') of Rafaella shares traded and that the Company has raised at least A\$1 million in equity,
- the payment of an upfront A\$10,000 due diligence payment and Lender legal fees,
- the Loan Note being secured with a PPSR over the assets of the Company, and
- entering in to a 3-year performance agreement for the payment of A\$100,000 in cash or shares (at the Company's option) per tranche, if the 5-day Rafaella share price VWAP exceeds 100% of the Closing Price.

If the Loan Note is not repaid in full within 90 days, then:

- the Loan Note is converted through the issuance of shares to the Lender over a maximum period of 3 years at the lower of the Premium Placement Price and 92% of the average of the 5-day VWAP over the previous 20 trading days, as elected by the Lender. Each issuance will be subject to the Company having sufficient capacity to place the securities, amounting to 2.5x the outstanding balance (excluding the options detailed below) divided by the average of the 5 daily VWAPs immediately preceding the Repayment Date.
- the Performance Agreement is cancelled and replaced with the issuance of 3-year options. The number of options issued shall equal 30% of the total tranches drawn, divided by the average of the 5 daily VWAPs preceding the Repayment Date ('**Repayment Date Price**'). The strike price will be equal to the lower of: (a) the Premium Placement Price, and (b) 30% premium to the Repayment Date Price, but in any event shall not be less than the Repayment Date Price.
- the Company may elect to repay the balance outstanding at any time post the Repayment Date if the share price is below the Premium Placement Price and with the payment of a redemption fee of 10% on the value repaid.

Appendix B Historical Exploration Results

In compliance with Question 37 of the ASX “Mining Reporting Rules for Mining Entities: Frequently Asked Questions” the following table is provided in relation to the Horden Lake Deposit. The points below address the discussion of historical exploration results.

Question	Answer
The acquirer’s view on the reliability of the estimates, including by reference to any of the criteria in Table 1 of the JORC Code 2012 which are relevant to understanding the reliability of estimates.	It is the CP’s opinion that the data is reliable given that the noted mineralised intersections are appropriately logged and explain the stated mineralisation.
To the extent known, a summary of the work programs on which the estimates were based and a summary of the key assumptions, mining and processing parameters and methods used to prepare the estimates	Please refer to the JORC Table 1 Section 2 “Exploration done by other parties.” Details of each singular programme are not known as the CP is in possession of collated data, however, the collated data appears to be valid and will require confirmation through compliant and methodical exploration practices via field work within the next 12 months.
The evaluation and/or exploration work that needs to be completed to report the estimates as Mineral Resources in accordance with the JORC Code 2012	On completion of the acquisition, the Company intends to commence exploration activities on the Horden Lake Project as soon as possible. There is a substantial amount of historical data that needs field verification, especially the metallurgical test-work on file. The Company intends, as an immediate priority, to reissue the resource report in accordance with JORC 2012 guidelines via a comprehensive desktop review of all the original datasets, which are available. The Company also expects to verify historical exploration work within the next 12 months via confirmation and extensional drilling. The Competent Person has reviewed the data and the Company is developing plans to expeditiously start exploration to verify and expand these known nickel, copper, precious metal, and cobalt occurrences.
The proposed timing of any evaluation and/or exploration work that the acquirer intends to undertake and a comment on how the acquirer intends to fund that work	The Company intends to conduct exploration work over the next 12 months. The drilling season is year-round, and it is the Company’s intention to conduct a targeted drill campaign at its earliest opportunity. The Company will be seeking funding to conduct this programme through several different options, including strategic funding partners and/or a capital raise.
A statement by a named Competent Person(s) that the information in the market announcement provided is an accurate representation of the available data and studies for the material mining project	The CP, as signed in this announcement, believes that the information contained within this announcement and in possession of the Company is an accurate representation of the available data and studies for the Project detailed in this announcement.
A cautionary statement proximate to, and with equal prominence as, the reported estimates stating that: <ul style="list-style-type: none"> • the estimates of Mineral Resources or Ore Reserves are not reported in accordance with the JORC Code 2012; • a Competent Person has not done sufficient work to classify the estimates of Mineral Resources or Ore Reserves in accordance with the JORC Code 2012 	Please refer to the cautionary statements inserted within the announcement.

- | | |
|--|--|
| <ul style="list-style-type: none">• it is possible that following evaluation and/or further exploration work the currently reported estimates may materially change and hence will need to be reported afresh under and in accordance with the JORC Code 2012;• that nothing has come to the attention of the acquirer that causes it to question the accuracy or reliability of the former owner's estimates; but• the acquirer has not independently validated the former owner's estimates and therefore is not to be regarded as reporting, adopting or endorsing those estimates. | |

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	<p>2008 Southampton Drilling ⁽¹⁾:</p> <ul style="list-style-type: none"> NQ diamond drill core was mechanically split in half: half for sample and half for reference. Typical sample intervals were from 0.5 to 2.0 m, based upon lithology and mineralization, but smaller intervals taken where appropriate. Core samples collected from mineralized intervals and from 10 to 15 m of the hanging and footwall of the mineralized section. In total, 6551 samples were collected. Descriptive information, including drill hole number, sample interval and character of mineralization, recorded using DHLogger software. Due to limited early-stage understanding of mineralized zone geometry, samples were not necessarily 'true' thickness <p>2012 El Condor Drilling ⁽⁴⁾:</p> <ul style="list-style-type: none"> HQ diamond core (half core) Typical sample intervals were from 0.5 to 1.5 m, based upon lithology and mineralization, but smaller intervals taken where appropriate. Descriptive information, including drill hole number, survey information, downhole survey, magnetic susceptibility, RQD, specific gravity, sample interval and character of mineralization, alteration recorded in Excel spreadsheets <p>1964-1968 INCO Drilling ^(5,6):</p> <ul style="list-style-type: none"> Some holes noted as BQ size core. Details of sampling techniques not available and not reviewed by Competent Person
Drilling techniques	<ul style="list-style-type: none"> Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> NW (76.2 mm dia.) casing set through overburden. Bedrock diamond drilling was standard tube NQ core (47.6 mm dia.) ⁽¹⁾. HW (101.6 mm) casing set through overburden. Bedrock diamond drilling standard tube HQ core (63.5 mm dia.) ⁽⁴⁾. Some holes noted as BQ (36.5 mm) ⁽⁶⁾. Details of drilling techniques not available and not reviewed by Competent Person
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and 	<ul style="list-style-type: none"> Average core recovery ranged from 90 to 95% ⁽¹⁾. No description of core recovery estimation method is provided in historical Technical Report ⁽¹⁾. Average core recovery in 2012 drilling ranged from 93.4% to 98.3% ⁽⁴⁾ No description of RQD estimation method accompanied logs.

Criteria	JORC Code explanation	Commentary
	<p><i>whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i></p>	<ul style="list-style-type: none"> • Overall recovery appears good enough to avoid sample bias. • Details of core recovery for INCO drilling were not available or reviewed by the Competent Person
Logging	<ul style="list-style-type: none"> • <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> • <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i> • <i>The total length and percentage of the relevant intersections logged.</i> 	<ul style="list-style-type: none"> • The Competent Person has reviewed historical drill logs⁽⁴⁾ but has not verified this information independently for quality control and quality assurance nor been to site. He therefore cannot comment on whether core has been geologically and geotechnically logged to a level of detail to support future Mineral Resource estimation, mining studies and metallurgical studies. Core logs were made for the full length of the core and are qualitative in nature. Both wet and dry core photographs exist.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> • <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> • <i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i> • <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> • <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> • <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> • <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<ul style="list-style-type: none"> • It is reported^(1,4) that core was split or sawn and sampled as half-core in marked intervals with remaining core kept for reference and stored. The Competent Person has not independently verified this information for quality control and quality assurance nor been to the sites and therefore reporting as stated. • Samples for both programs were prepared and analysed by standard mineral geochemistry methods at a primary certified lab (Activation Laboratories (Actlabs), Ancaster ON)⁽¹⁾ • Quality control procedures for 2008 drilling were reviewed, and included field, reject and pulp duplicates⁽¹⁾. Some inefficiencies in core processing procedures were noted. • Quality control procedures for 2012 drilling were reviewed, and included field duplicates, and insertion of quartz blanks and blind standards⁽⁴⁾.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> • <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> • <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> • <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<ul style="list-style-type: none"> • Both the 2008 and 2012 drill programs included a QA/QC program. • No details of QA/QC procedures for INCO drilling were available or reviewed by the Competent person. • 2008 drill program sampling included one blank and two of three (high, medium and low) Cu-Ni-PGE standards, as well as laboratory pulp and reject duplicates. Samples were analysed for gold (Au), palladium (Pd), and platinum (Pt) through fire assay, and all other elements (31 including Cu and Ni) were analysed using aqua regia digestion with an ICP-OES finish. Five percent of the sample database (141 coarse reject samples) and 17 QC samples were sent to Accurassay Laboratories for analysis as a quality control check. • Extensive QA/QC checks, including reanalysis of failed (outside 2sδ) samples concluded that Cu and Ni outliers were acceptable for resource estimation and that ‘the re-assay by Accurassay of 5% of the samples used in the resource model calculation confirms that the original assays by Actlabs are of good quality’⁽¹⁾ • The Competent person has not independently verified this information

Criteria	JORC Code explanation	Commentary
		<p>for quality control and quality assurance to comment on the nature, quality and appropriateness of the assaying and laboratory procedures used, nor has he been to site.</p> <ul style="list-style-type: none"> • 2012 drill program sampling included one field duplicate, one quartz blank and one of three CRMs every 25 samples, as well as laboratory reject and pulp duplicates. • Samples were analysed for gold (Au), palladium (Pd), and platinum (Pt) through fire assay, and other elements (36) by four-acid digestion and ICP-MS analysis. Overlimit for Cu and Ni were reanalysed by ICP-OES. ⁽⁴⁾ • It is not clear whether external check analysis was performed.
Verification of sampling and assaying	<ul style="list-style-type: none"> • <i>The verification of significant intersections by either independent or alternative company personnel.</i> • <i>The use of twinned holes.</i> • <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> • <i>Discuss any adjustment to assay data.</i> 	<ul style="list-style-type: none"> • Significant intersections have been reported historically and some of these are presented in the press release above. The Competent Person has not independently verified this information for quality control and quality assurance nor been to the site. • The 2008 drill program informing the historical resource estimate quoted in this news release employed an external check lab (Accurassay Laboratories) ⁽¹⁾. • No external check lab appears to have been used for the 2012 drill program.
Location of data points	<ul style="list-style-type: none"> • <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> • <i>Specification of the grid system used.</i> • <i>Quality and adequacy of topographic control.</i> 	<ul style="list-style-type: none"> • Drillhole collars were surveyed using Trimble GEO XH using Zephyr™ external antenna and base corrected using GPS Pathfinder software The results of the DGPS survey were utilized for the transformation of historical INCO data from local grid to UTM space (+/- 10cm accuracy). • Location accuracy of drill collars considered adequate for early-stage resource estimation. • Down hole survey data collected with Flexit and Reflex Maxibore instruments. Reflex Maxibore is an advanced instrument for is considered more accurate in magnetically disturbed environments. • Survey data with Reflex Maxibore collected at every 3 m from hole bottom and transferred digitally into database. • Down hole survey data accuracy considered adequate for early-stage resource estimation.
Data spacing and distribution	<ul style="list-style-type: none"> • <i>Data spacing for reporting of Exploration Results.</i> • <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> • <i>Whether sample compositing has been applied.</i> 	<ul style="list-style-type: none"> • Drill holes spaced 50 m apart along gridlines. ⁽¹⁾ • The mineralized zone was modelled on sections at intervals of approximately 50 m. The zones were extended 25 m along strike to the north-east and south-west, beyond the last section drilled. • Drill density (168 holes) sufficient for inferred and indicated resource estimate ⁽¹⁾. • Sample compositing at 1.5 m in mineralized zones applied ⁽¹⁾.

Criteria	JORC Code explanation	Commentary
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<ul style="list-style-type: none"> Information about the orientation of data in relation to geological structure applied is not presented in the reports reviewed by the Competent Person From map presentation and cross-sections, drill hole azimuth and inclination appear to have been designed to minimize sample bias. ^(1,4)
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> All samples were tagged using pre-printed sample tags with a unique 5-digit number and bagged in individual plastic bags. Ten individual bags were collected in rice bags prior to shipping. the core was stored at Horden Lake camp which was a very remote location., Only drilling company staff and the CCIC geologists had access. The samples were transported from Matagami to Laboratoire Expert, in Noranda by bus (Expedibus) and by a private freight company (Rona Inc.) to Actlabs in Ancaster ON ⁽¹⁾. 2012 drilling program conducted by CCIC using same camp and laboratory ⁽⁴⁾. No details of sample security procedures were available or reviewed by the Competent Person.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> For 2009 Technical Report resource estimation, Luc Harnois, Ph.D., and P.Geo., (OGQ, APGO) reviewed the 2008 drill program while underway. His review included: <ul style="list-style-type: none"> Core logging and sampling of 21 diamond drill holes totalling 5.2 km. Locating several drill holes on the grid. The azimuth and dip of these drill holes was verified ⁽¹⁾ The Competent Person has not independently verified this information nor been to the site.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The Horden Lake Project is located approximately 140 km north of Matagami in Quebec, Canada (Figure 1). The Horden Lake property consists of 18 mineral tenements totalling 814.81 hectares (Figure 2)

Criteria	JORC Code explanation	Commentary																																																																																																																														
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> Exploration to date has been completed by other parties including INCO and Caracle Creek International Consulting Ltd (CCIC) ^(1,4). The Competent Person has reviewed reports and files pertaining to the 2008 and 2012 campaigns but has not independently verified the contained information nor been to site. 																																																																																																																														
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralisation. 	<ul style="list-style-type: none"> Magmatic PGM-Ni-Cu sulphide mineralisation within the Frotet-Evans Greenstone Belt in the Opatca Subprovince. Dominant rock types are metavolcanic and metasedimentary rocks. Meta-gabbro occurs as a long and narrow, concordant body and has inclusions of meta-sedimentary rocks. Granites intrude the metasedimentary and metavolcanic package and are cut by granitic dikes and pegmatites. The youngest rocks in the area are gabbro and diabase dikes. Dominant host of the mineralization appears to be the gabbro with up to 5 % disseminated to massive pyrrhotite, pyrite and chalcopyrite, and blebby sulphides also occur in shear zones ^(1,4). Local sphalerite and galena occur in altered gabbro ⁽¹⁾. 																																																																																																																														
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. 	<p>Summary of 2008 resource drill hole locations and collaring information.</p> <table border="1"> <thead> <tr> <th>BHID</th> <th>Easting</th> <th>Northing</th> <th>Elevation</th> <th>Azimuth</th> <th>Dip</th> <th>Depth (m)</th> </tr> </thead> <tbody> <tr><td>HN-08-01</td><td>303548</td><td>5646926</td><td>249.27</td><td>124</td><td>70</td><td>180</td></tr> <tr><td>HN-08-02</td><td>303472</td><td>5646977</td><td>250.37</td><td>124</td><td>60</td><td>255</td></tr> <tr><td>HN-08-03</td><td>303471</td><td>5646978</td><td>249.99</td><td>124</td><td>70</td><td>276</td></tr> <tr><td>HN-08-04</td><td>303395</td><td>5647030</td><td>251.17</td><td>124</td><td>60</td><td>317</td></tr> <tr><td>HN-08-05</td><td>303393</td><td>5647031</td><td>250.83</td><td>124</td><td>70</td><td>342</td></tr> <tr><td>HN-08-06</td><td>303588</td><td>5646898</td><td>249.20</td><td>124</td><td>45</td><td>103</td></tr> <tr><td>HN-08-07</td><td>303585</td><td>5646899</td><td>247.94</td><td>124</td><td>70</td><td>150</td></tr> <tr><td>HN-08-08</td><td>303451</td><td>5646691</td><td>251.41</td><td>124</td><td>45</td><td>111</td></tr> <tr><td>HN-08-09</td><td>303448</td><td>5646692</td><td>250.24</td><td>124</td><td>70</td><td>150</td></tr> <tr><td>HN-08-10</td><td>303409</td><td>5646717</td><td>250.91</td><td>124</td><td>70</td><td>168</td></tr> <tr><td>HN-08-11</td><td>303331</td><td>5646770</td><td>251.00</td><td>124</td><td>60</td><td>264</td></tr> <tr><td>HN-08-12</td><td>303330</td><td>5646770</td><td>250.61</td><td>124</td><td>70</td><td>300</td></tr> <tr><td>HN-08-13</td><td>303259</td><td>5646820</td><td>250.57</td><td>124</td><td>60</td><td>342</td></tr> <tr><td>HN-08-14</td><td>303258</td><td>5646820</td><td>250.23</td><td>124</td><td>70</td><td>368</td></tr> <tr><td>HN-08-15</td><td>303491</td><td>5646843</td><td>250.01</td><td>124</td><td>70</td><td>192</td></tr> <tr><td>HN-08-16</td><td>303412</td><td>5646895</td><td>250.86</td><td>124</td><td>60</td><td>254</td></tr> <tr><td>HN-08-17</td><td>303411</td><td>5646895</td><td>250.37</td><td>124</td><td>70</td><td>300</td></tr> </tbody> </table>	BHID	Easting	Northing	Elevation	Azimuth	Dip	Depth (m)	HN-08-01	303548	5646926	249.27	124	70	180	HN-08-02	303472	5646977	250.37	124	60	255	HN-08-03	303471	5646978	249.99	124	70	276	HN-08-04	303395	5647030	251.17	124	60	317	HN-08-05	303393	5647031	250.83	124	70	342	HN-08-06	303588	5646898	249.20	124	45	103	HN-08-07	303585	5646899	247.94	124	70	150	HN-08-08	303451	5646691	251.41	124	45	111	HN-08-09	303448	5646692	250.24	124	70	150	HN-08-10	303409	5646717	250.91	124	70	168	HN-08-11	303331	5646770	251.00	124	60	264	HN-08-12	303330	5646770	250.61	124	70	300	HN-08-13	303259	5646820	250.57	124	60	342	HN-08-14	303258	5646820	250.23	124	70	368	HN-08-15	303491	5646843	250.01	124	70	192	HN-08-16	303412	5646895	250.86	124	60	254	HN-08-17	303411	5646895	250.37	124	70	300

(Criteria listed in section 1, and where relevant in section 2, also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database Integrity	<ul style="list-style-type: none"> Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. Data validation procedures used. 	<ul style="list-style-type: none"> Ten percent of analytical data on assay certificates were checked by CCIC against the data in the merged sheets (database) and no errors were found. A total of 730 assays, which included drill core, standards, and blanks, were checked. Four to five assays were randomly checked from each assay certificate. ⁽¹⁾ Information about the database integrity was not directly reviewed by the Competent Person ⁽¹⁾.
Site visits	<ul style="list-style-type: none"> Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. 	<ul style="list-style-type: none"> This press release is a review of historical work performed on the Property. The Competent Person did not conduct any site visit in conjunction with the preparation of the attached press release. An extensive site visit was conducted by Luc Harnois, PhD., P. Geo from 31 January to 11 February 2008 and from 11 March to 22 March 2008 in conjunction with the CCIC resource estimate reported herein ⁽¹⁾.

Criteria	JORC Code explanation	Commentary
Geological Interpretation	<ul style="list-style-type: none"> Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect, if any, of alternative interpretations on Mineral Resource estimation. The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology. 	<ul style="list-style-type: none"> Mineral resources reported in this press release are historical in nature. The data has not been reviewed directly by the Competent Person. In his opinion, the assumptions and interpretations made regarding geology and mineralization of the Horden Lake deposit in support of the Mineral Resource Estimation are reasonable.
Dimensions	<ul style="list-style-type: none"> The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource. 	<ul style="list-style-type: none"> The plan projection for the Mineral Resource Estimate for the Horden Lake Deposit is 1000m by 1424 m. The upper limit of the Resource is 251.8 m AMSL and for the lower limit -308.2 m AMSL (559.9 m thickness)⁽¹⁾.
Estimation and modelling techniques	<ul style="list-style-type: none"> The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used. The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. The assumptions made regarding recovery of by-products. Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation). In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed. Any assumptions behind modelling of selective mining units. Any assumptions about correlation between variables. Description of how the geological interpretation was used to control the resource estimates. Discussion of basis for using or not using grade cutting or capping. The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. 	<ul style="list-style-type: none"> For the 2009 Resource Estimate prepared by CCIC: <ul style="list-style-type: none"> The database consists of: <ol style="list-style-type: none"> 95 drill holes completed by INCO between in 1969; and 73 drill holes completed by Southampton between January 26 and March 30, 2008. CCIC completed a detailed compilation of historic data provided by Southampton. The compilation included the digital capture of the following items: <ul style="list-style-type: none"> 81 geological sections 9 geological plans 155 drill holes logs The wireframe 3D model is based on 0.5 % Cu cut-off grade using both INCO and CCIC drilling. The mineralized zone was modelled on sections at intervals of approximately 50 m. The zones were extended 25 m along strike to the north-east and south-west, beyond the last section drilled. The final wireframe model consists of 2 zones: the primary zone of mineralization which extends for a strike length of approximately 1500 m, and a secondary, hanging wall zone (Zone 2) which sits parallel to the Zone 1 but extends for a strike length of ~290 m. The average strike direction of Zone 1 is 210°, and the average dip direction is 57° to the northwest. The average thickness of Zone 1 is approximately 19 m. The average strike direction of Zone 2 is 210 and the average dip direction is 57° to the northwest. The average thickness of Zone 1 is approximately 10 m⁽¹⁾.

Criteria	JORC Code explanation	Commentary
----------	-----------------------	------------

- **Adjustments to sample database:** Due to the low incident of outliers, sample constraining (sample capping or top capping) was not completed. Top cutting tests were conducted for Cu and Ni; the outcome of the resource estimate was not apparent in the significant digits in which it is stated. ⁽¹⁾
- **Sample Composites:** The assay sampling interval for INCO data was mostly 1.5 m; the sample length during the 2008 program was primarily 1.0 m (Figure 17-3). Drill hole assays were set to 1.5 m composite lengths within the mineralized zone. A minimum composite length of 0.5 m was utilized; samples less than 0.5 m were discarded ⁽¹⁾.
- **Estimation Parameters:** Datamine Studio 3 was used by CCIC to calculate experimental down-hole and across strike variograms for Cu, Ni, Au, Ag and Pd. The INCO and Southampton data were treated as separate populations. The variograms calculated using the Southampton data exhibited better structures. These were therefore used to create the variogram models. A summary of estimation parameters derived from the variogram modelling ⁽¹⁾:
- **Block Model:** Details of the block model are presented below.

Direction	Nugget	Variogram Range (m)	Base Search Distance (m)	Max. Search Distance (m)
Down-dip	0.13	119.78	95.82	191.65
Across-strike	0.13	172.85	138.28	276.56
Normal vertical	0.13	9.95	7.96	15.93

- **Relatively small blocks with sub cells** were utilized due to the anastomosing, reef-like nature of the deposit ⁽¹⁾.

Axis	Origin	Parent Block	Subcell	Discretization Points
X	302750	10	5	2
Y	5645750	20	10	3
Z	-325	10	5	2

- **Grade Interpolation:** The Estimate was completed using the Ordinary Kriging method and is stated below at 0.5% and 1.0% Cu block cut-offs. Due to their erratic variogram structures, and low grade, only analysed for in the 2008 program, values for Au, Ag, and Pd are excluded from the statement of the Estimate.
