

HIGH GRADE LITHIUM ASSAYS RETURNED FROM McCOMBE AND

DRILLING RESUMED AT SEYMOUR AND ROOT

HIGHLIGHTS

- Assays received for a further 11 diamond holes at McCombe, Root including:
 - o RL-22-0041: **15.9m @ 1.12% Li₂0** from 98.1m (incl. **6.0m @ 1.91% Li₂0** from 99.0)
 - o RL-22-0027: **12.3m @ 1.34% Li₂0** from 3.4m (incl. **11.4m @ 1.41% Li₂0** from 4.2m)
 - o RL-22-0035: **12.7m @ 1.28% Li₂0** from 66.5m
 - o RL-22-0038: 8.4m @ 1.18% Li₂O from 81.5m (incl. 5.0m @ 1.91% Li₂O from 81.5m)
- Phase 2 McCombe extensional drilling continuing to explore the lithium bearing pegmatites along strike and down dip
- All weather camps operational with full complement of staff
- All weather roads connecting camps to airports and Thunder Bay
- 6 diamond drill holes completed, and logging and assaying commenced at Morrison, Root
- Maiden Root Mineral Resource Estimate, on track for Q12023

Green Technology Metals Limited (**ASX: GT1**)(**GT1** or the **Company**), a Canadian-focused multi-asset lithium business, is pleased to announce further high-grade lithium assay results from its 100%-owned **Root Project**, located approximately 200km west of its flagship Seymour Project in Ontario, Canada. Drilling at Root was initially focussed on the **McCombe** LCT pegmatite system, targeting rapid delineation of a maiden Mineral Resource Estimate, but has now expanded to the **Morrison** prospect, situated 1 km east of McCombe. Drilling is actively underway in 2023 with 2 drill rigs working day + night shift at Root.

"The high-grade assay results received from Phase 2 extensional drilling at McCombe demonstrate continuation of the lithium bearing pegmatites along strike and down dip. Several additional lithium bearing pegmatites have been intersected to the north-east and drilling will continue to delineate their extent".

"The second drill rig mobilised to the Morrison prospect just before Christmas and completed 6 diamond holes, all intersecting pegmatite. Logging and assaying are now underway with the rig continuing in a north & west direction towards McCombe"

GT1 Chief Executive Officer, Luke Cox

94 Rokeby Road, Subiaco, Western Australia 6008 +61 8 6557 6825 www.greentm.com.au info@greentm.com.au ABN 99 648 657 649

McCombe Deposit (Root Project)

The McCombe LCT (Lithium-Caesium-Tantalum) pegmatite is currently the most advanced prospect at the Root Project. Historical drilling completed by previous owners from 1950 to 2016 intersected numerous pegmatites, generally dipping to the south and striking east-west. Phase 1 and Phase 2 drilling by GT1 has now demonstrated McCombe to be a simpler mineralised system consisting of:

- one major pegmatite averaging 10m true thickness (ranging 2m to 19m), striking east-west with shallow dip approximately 30 degrees to the south, open along strike and down dip
- four pegmatites striking north-east with shallow to moderate dip to the south located in the northeast quadrant, all open along strike and down dip

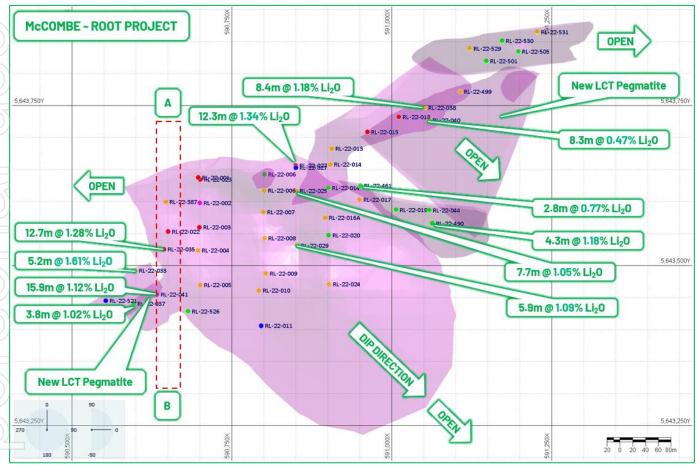

Figure 1: Plan view of McCombe interpreted pegmatite, thickness, and recent assays (cross section A-B)

Phase 1 drilling at McCombe is now complete, comprising of twenty-two (22) resource definition diamond holes. Assays have been returned for all twenty-two (22) holes and have intersected thick and continuous high grade spodumene pegmatites from surface in all 22 holes. The Phase 1 drilling has delineated, extended, and simplified the historical mineralised pegmatites in all directions, Phase 2 drilling will continue to explore the pegmatites along strike and down dip in the coming weeks for incorporation into the maiden Mineral Resource Estimate.

Table 1: McCombe drilling results - Phase 1 (grey highlight) and 2 (Vis Est. % = Visual estimate of Spodumene mineral abundance*)

* In relation to the disclosure of visual mineralisation, the Company cautions that visual estimates of mineral abundance should never be considered a proxy or substitute for laboratory analysis. Laboratory assay results are required to determine the widths and grade of the visible mineralisation reported in preliminary geological logging. The Company will update the market when laboratory analytical results become available. The reported intersections are down hole measurements and are not necessarily true width. Descriptions of the mineral amounts seen and logged in the core are qualitative, visual estimates only (they are listed in order of abundance of estimated combined percentages).

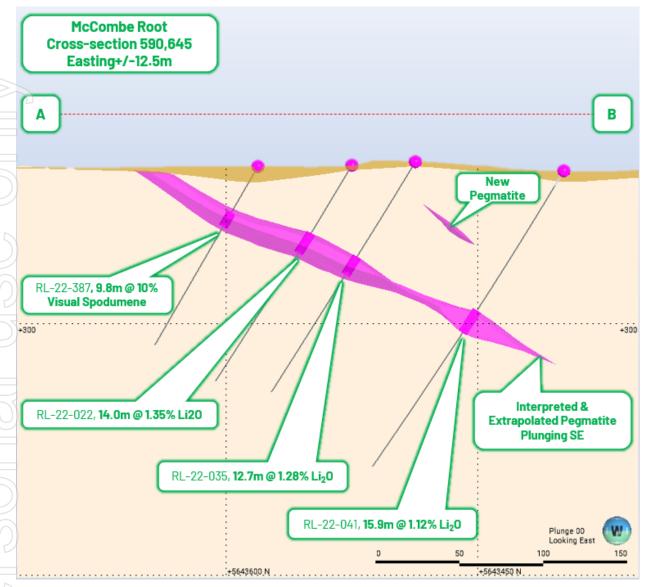

Figure 2: Cross section of the main McCombe pegmatite looking east and pegmatite plunging southeast (into the page)

Figure 3: RL-22-041 – Whole NQ diamond core showing high density spodumene crystal laths, 15.9m @ 1.12% Li₂0 from 98.1m (incl. 6.0m @ 1.91% Li₂0 from 99.0m)

Morrison Deposit (Root Project)

The Morrison LCT spodumene pegmatites, located approximately 1km east of McCombe, were explored in the mid to late 1950's. The pegmatites strike east west and dip about 30 degrees towards the south. Outcrop of the pegmatite is approximately 200m long and tested by trenching, but historical drilling has also proven the strike of the pegmatite to be at least 1.6km to the west with additional occurrences to the north.

Initial drilling at Morrison comprising of twenty (20) holes for 2,500m is targeted to confirm historical drilling and sampling. The second phase of drilling is then planned to test for extensions of the mineralised pegmatites in all directions, infill key sections and rapidly facilitate delineation of a Mineral Resource estimate.

Six (6) diamond holes were completed at the end of December and logging and assaying has now commenced.

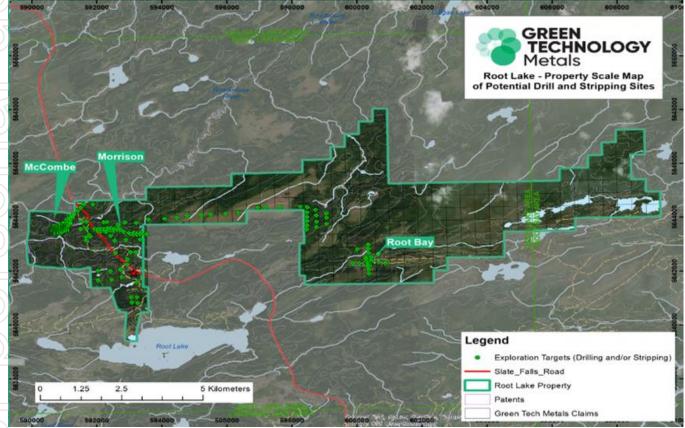

Figure 4: Root Project location map, McCombe, Morrison and Root Bay prospects

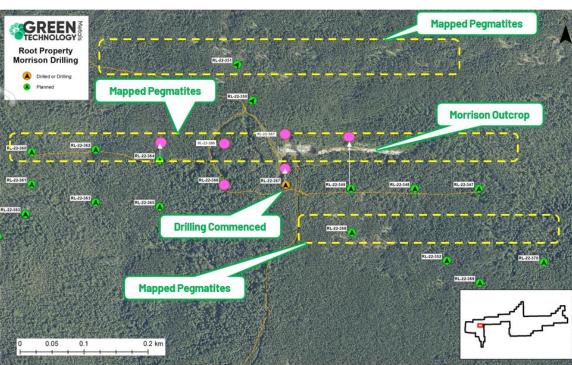

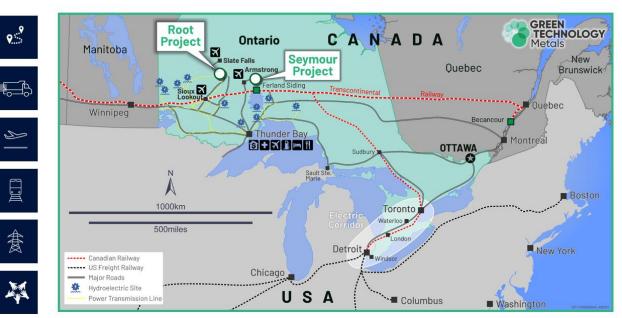

Figure 5: Morrison outcrop, mapped pegmatites, planned holes (green) and drilled holes (pink)

Root Project Infrastructure

The Root Project is readily accessible via all-weather roads and airports with emergency response capability in Slate Falls and Sioux Lookout. The Transcontinental railway connects Root and Seymour projects with a direct line and sidings managed by CN Rail. Hydro power lines run through the eastern side of the Root Project electrifying the region with green energy.

Green Technology Metals (ASX:GT1)

GT1 is a North American focussed lithium exploration and development business. The Company's 100% owned Ontario Lithium Projects comprise high-grade, hard rock spodumene assets (Seymour, Root and Wisa) and lithium exploration claims (Allison and Solstice) located on highly prospective Archean Greenstone tenure in north-west Ontario, Canada.

All sites are proximate to excellent existing infrastructure (including hydro power generation and transmission facilities), readily accessible by road, and with nearby rail delivering transport optionality.

Seymour has an existing Mineral Resource estimate of 9.9 Mt @ 1.04% Li₂O (comprised of 5.2 Mt at 1.29% Li₂O Indicated and 4.7 Mt at 0.76% Li₂O Inferred).¹ Accelerated, targeted exploration across all three projects delivers outstanding potential to grow resources rapidly and substantially.

¹ For full details of the Seymour Mineral Resource estimate, see GT1 ASX release dated 23 June 2022, *Interim Seymour Mineral Resource Doubles to 9.9Mt*. The Company confirms that it is not aware of any new information or data that materially affects the information in that release and that the material assumptions and technical parameters underpinning this estimate continue to apply and have not materially changed.

APPENDIX A: IMPORTANT NOTICES

Competent Person's Statements

Information in this report relating to Exploration Results is based on information reviewed by Mr Luke Cox (Fellow AusIMM). Mr Cox has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Cox consents to the inclusion of the data in the form and context in which it appears in this release. Mr Cox is the Chief Executive Officer of the Company and holds securities in the Company.

No new information

Except where explicitly stated, this announcement contains references to prior exploration results, all of which have been cross-referenced to previous market announcements made by the Company. The Company confirms that it is not aware of any new information or data that materially affects the information included in the relevant market announcements.

The information in this report relating to the Mineral Resource estimate for the Seymour Project is extracted from the Company's ASX announcement dated 23 June 2022. GT1 confirms that it is not aware of any new information or data that materially affects the information included in the original announcement and that all material assumptions and technical parameters underpinning the Mineral Resource estimate continue to apply.

Forward Looking Statements

Certain information in this document refers to the intentions of Green Technology Metals Limited (ASX: GT1), however these are not intended to be forecasts, forward looking statements or statements about the future matters for the purposes of the Corporations Act or any other applicable law. Statements regarding plans with respect to GTI's projects are forward looking statements and can generally be identified by the use of words such as 'project', 'foresee', 'plan', 'expect', 'aim', 'intend', 'anticipate', 'believe', 'estimate', 'may', 'should', 'will' or similar expressions. There can be no assurance that the GT1's plans for its projects will proceed as expected and there can be no assurance of future events which are subject to risk, uncertainties and other actions that may cause GT1's actual results, performance or achievements to differ from those referred to in this document. While the information contained in this document has been prepared in good faith, there can be given no assurance or guarantee that the occurrence of these events referred to in the document will occur as contemplated. Accordingly, to the maximum extent permitted by law, GT1 and any of its affiliates and their directors, officers, employees, agents and advisors disclaim any liability whether direct or indirect, express or limited, contractual, tortuous, statutory or otherwise, in respect of, the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and do not make any representation or warranty, express or implied, as to the accuracy, reliability or completeness of the information in this document, or likelihood of fulfilment of any forward-looking statement or any event or results expressed or implied in any forward-looking statement; and disclaim all responsibility and liability for these forward-looking statements (including, without limitation, liability for negligence).

APPENDIX B: JORC CODE, 2012 EDITION - Table 1 Report

Section 1 Sampling Techniques and Data

C	Criteria	JORC Code explanation	Commentary
S	Sampling echniques	 Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	 The McCombe deposit at the Root project is a new discovery and, as such, has not been historically sampled. An excavator has exposed and enlarged the outcrop area to make it amenable to mapping and sampling. GT1 commenced a diamond drilling on September 3, 2022 at the McCombe prospect with 51 holes completed to date and more planned. Diamond Drilling Diamond drilling was used to obtain nominally 1m downhole samples of core. N0 core samples were ½ cored using a diamond saw with ½ the core placed in numbered sample bags for assaying and the other half retained in sequence in the core tray. ½ core samples were approximately 3.0kg in weight with a minimum weight of 500grams. Core was cut down the apex of the core and the same downhole side of the core selected for assaying to reduce potential sampling bias. Channel Samples Preparation prior to obtaining the channel samples including grid and georeferences and marking of the pegmatite structures. Samples were cut across the pegmatite with a diamond saw perpendicular to strike. Average 1 metre samples are obtained, logged, removed and bagged and secured in accordance with QAOC procedures. Samples were ther transported directly to the laboratory for analysis accompanied with the log and instruction forms. Bagging of the samples was supervised by a geologist to ensure there are no numbering mix-ups. One tag from a triple tag book was inserted in the sample bag. Grab Samples Preparation prior to obtaining the grab sample including logging location with D/GPS, geological setting and rock identification and mineralogy Samples were then transported directly to the laboratory for analysis accompanied with the log and instruction forms. Bagging of the samples was supervised by a geologist to ensure there are no numbering mix-ups. One tag from a triple tag book was inserted in the sample bag. <
	Drilling echniques	• Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc).	 One tag from a triple tag book was inserted in the sample bag. Tri-cone drilling was undertaken through the thin overburden prior to NQ2 diamond drilling through the primary rock using a standard tube.

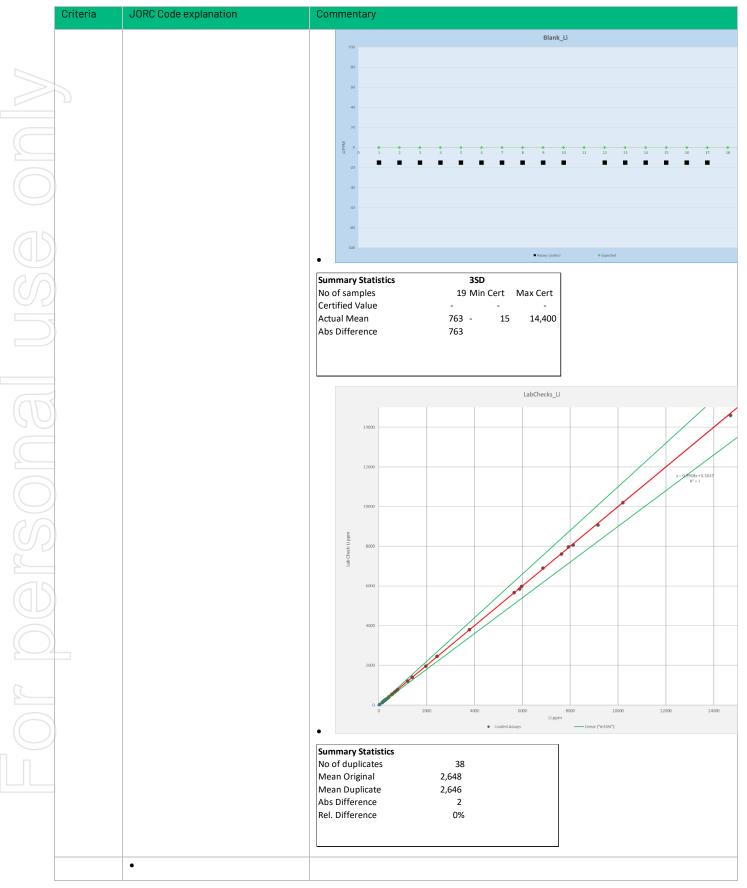

Criteria	JORC Code explanation	Commentary			
Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	 No core was recovered through the overburden tri-coned section of the hole (top 5m of the hole) Core recovery through the primary rock and mineralised pegmatite zones was 98%. Country rock, mainly meta basalts showed high, 96% recoveries. The core has not been assayed yet so no correlation between grade and recovery can be made at this time. Recovery was determined by measuring the recovered metres in the core trays against the drillers core block depths for each run. 			
Logging	 Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	 Each sample was logged for lithology, minerals, grainsize and texture as well as alteration, sulphide content, and any structures. Logging is qualitative in nature. Samples are representative of an interval or length. Sampling will be undertaken for the entire cross strike length of the intersected pegmatite unit at nominal 1m intervals with breaks at geological contacts. Sampling extended into the country mafic rock. 			
Sub- sampling techniques and sample preparation	 If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	 Each ½ core sample was dried, crushed to entirety to 90% -10 mesh, riffle split (up to 5 kg) and then pulverized with hardened steel (250 g sample to 95% -150 mesh) (includes cleaner sand). Blanks and Certified Reference samples will be inserted in each batch submitted to the laboratory at a rate of approximately 1:20. The sample preparation process is considered representative of the whole core sample. 			
 Quality of assay data and laboratory tests	 The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters 	 Actlabs inserted internal standards, blanks and pulp duplicates within each sample batch as part of their own internal monitoring of quality control. GT1 inserted certified lithium standards and blanks into each batch submitted to Actlabs to monitor precision and bias performance at a rate of 1:20. The major element oxides and trace elements including Rb, Cs, Nb, Ta and Be were analysed by FUS-ICP and FUS-MS (4Litho-Pegmatite Special) analytical codes which uses a lithium metaborate tetraborate fusion with analysis by ICP and ICPMS. 			

Criteria	JORC Code explanation	Commentary
Criteria	 JORC Code explanation used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	 QAQC results to date do not indicate any significant issues with the assays however the results for 3 recent batches are being investigated with the laborate to confirm QAQC anomalies.

Criteria	JORC Code explanation	Commentary
Verification of sampling and assaying	 The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	 Most of the holes in the McCombe program to date are drilled close to existing historic drilling from the 1950's. Whilst the historic drilling suggests some spatial issues with the holes collar locations, the current drilling largely supports the existence of significant pegmatite and Li₂O intersections at McCombe. Historic drilling data could not be verified and QAQC was likely not included in the testing regime at the time. The laboratory assay results have been sourced directly from the laboratory and the laboratory file directly imported directly into GTI's SQL database. All north seeking gyroscope surveys are uploaded directly from the survey tool output file and visually validated. Geological logs and supporting data are uploaded directly to the database using custom built importers to ensure no chance of typographical errors. No adjustment to laboratory assay data was made other than conversion of Li ppm to Li₂O using a factor of 2.153
Location of data points	 Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	 A GPS reading was taken for each sample location using UTM NAD83 Zone15 (for Seymour); waypoint averaging or dGPS was performed when possible. GT1 undertook a Lidar survey of the Root area in 2022 (+/- 0.15m) which underpins the local topographic surface. GT1 has used continuous measurement north seeking gyroscope tools with readings retained every 5m downhole.
Data spacing and distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. 	 NA – insufficient drilling has been undertaken to estimate the degree of geological and grade continuity to support a Mineral Resource or Ore Reserve.

Criteria	JORC Code explanation	Commentary
	 Whether sample compositing has been applied. 	
Orientation of data in relation to geological structure	 Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	 The current drilling program is drilled to achieve as close to a representative intersection of the pegmatites as possible which dip moderately to the south. Holes are orientated approximately north and 60 degrees inclination. Grab and trench samples were taken where outcrop was available. All attempts were made to ensure trench samples represented traverses across strike of the pegmatite.
Sample security	• The measures taken to ensure sample security.	 All core and samples were supervised and secured in a locked vehicle, warehouse, or container until delivered to AGAT in Thunder Bay for cutting, preparation and analysis.
Audits or reviews	 The results of any audits or reviews of sampling techniques and data. 	• NA

Section 2 Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	 Green Technology Metals (ASX:GT1) holds a 100% interest in the Ontario Lithium Projects (Seymour, Root and Wisa). Root Lithium Asset consist of 249 single and boundary cell claims (Exploration Licences), 33 patent claims and 3 mining licence of occupation claims (total 285 claims) with a total claim area of approximately 5,376ha. All Cell Claims are in good standing An Active Exploration Permit for 3 years exist over the Root Lithium Assets, including the McCombe Deposit, Morrison Prospect and Root Bay Prospect. There is an Early Exploration Agreement with Slate Falls Nation and Lac Seul First Nation, who are supportive of GT1 exploration activities.

(Criteria	JORC Code explanation	Commentary
C	Exploration done by other parties	 Acknowledgment and appraisal of exploration by other parties. 	 Regional exploration for lithium deposits commenced in the 1950's. In 1955-1950 Capital Lithium Mines Ltd. geologically mapped and sampled Miles near the McCombe Deposit with the highest recorded channel sample of 1.52m at 3.06% Lto. 7 drill holes (1.04.2.26m total) within the McCombe Deposit and Root Lake Prospect yielding low lithium assays. According to Mulligan (1965), Capital Lithium Mines Ltd. reported to Mulligan that they drilled at least 55 holes totalling 10469.86m in 1956. They delineated 4 pagmatite zones and announced a non-compliant NI 41-101 reserve calculation of 2.297 million tons at 1.3% Ltp. O However, none of that information is available on the government database. In 1956, Three Brothers Mining Exploration southwest of the McCombe Deposit that did not intersect pegmatite In 1957, Geo-Technical Development Company Limited on behalf of Continental Mining Exploration conducted a magnetometer survey and an electromagnetic check survey on the eastern claims of the Root Lithium Project to locate pyrhotite mineralization In 1977, Northwest Geophysics Limited on behalf of Noranda Exploration Company Ltd. conducted a megnetometer survey for sulphide conductors on a small package of claims east of the Morrison Prospect. Noranda also conducted a mapping and sampling program over the same area. mapped a new pegmatite dike and sampled a graphitic schist assaying 0.03%. Cu and 0.15% Zh. In 1998, Harold A. Watts prospected, trenched and sampled spodumene-bearing pegmatites with the Morrison Prospect Land Inc. created a reconnissance survey, mapping and sampling project mostly within the McCombe Deposit, but also in the Morrison and Root Lake Prospects. Highest assaying up to 5.9% Ltp.0. In 2002 stripped and blasted Z more spodumene-bearing pegmatites were discovered with assays up to 4.0g/rt Au aron A (Root Bay Bodi Prospect), 3.3% dat over 0.5m in Trench 9.0.19% Cu-2n over 8 mad up to 0.1% X Lio 0.08 hole XL do nobedi of Rober
	Geology	 Deposit type, geological setting and style of mineralisation. 	Regional Geology: The Root Lithium Asset is located within the Uchi Domain, predominately metavolcanic units interwoven with granitoid batholiths and English River Terrane, a highly metamorphosed to migmatized, clastic and chemical metasedimentary rock with abundant granitoid batholiths. They are part of the Superior craton, interpreted to be the amalgamation of Archean aged microcontinents and accretionary events. The boundary between the Uchi Domain

Criteria	JORC Code	Commentary
	explanation	
		 and the English River Terrane is defined by the Sydney Lake - Lake St. Joseph fault, an east west trending, steeply dipping brittle ductile shear zone over 450km along strike and 1 - 3m wide. Several S-Type, peraluminous granitic plutons host rare-element mineralization near the Uchi Domain and English River subprovince boundary. These pegmatites include the Root Lake Pegmatite Group, Jubilee Lake Pegmatite Group, Sandy Creek Pegmatite and East Pashkokogan Lake Lithium Pegmatite. Local Geology: The Root Lithium Asset contains most of the pegmatites within the Root Lake Pegmatite Group including the McCombe Pegmatite, Morrison Prospect, Root Lake Prospect and Root Bay Prospect. The McCombe Pegmatite and Morrison Prospect are hosted in predominately mafic metavolcanic rock of the Uchi Domain. The Root Lake and Root Bay Prospects are hosted in predominately metasedimentary rocks of the English River Terrane. On the eastern end of the Root Lithium Asset there is a gold showing (Root Bay Gold Prospect) hosted in or proximal to silicate, carbonate, sulphide, and oxide iron formations of the English River Terrane. Ore Geology: The McCombe Pegmatite is internally zoned. These zones are classified by the tourmaline-bearing, equigranular to porphyritic potassium feldspar sodic apalite zone, tourmaline-bearing, equigranular to porphyritic potassium feldspar solic apalite zone, tourmaline-being, porphyritic potassium feldspar spodumene pegmatite zone and lepidolite-rich pods and seams (Breaks et al., 2003). Both the McCombe and Morrison pegmatites have been classified as complex-type, spodumene-subtype (Černý 1991a classification) based on the abundance of spodumene, highly evolved potassium feldspar chemistry and presence of petalite, mircolite, lepidolite and lithium-calcium liddicoatite (Breaks et al., 2003).
Drill hole Information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. 	 McCombe lies within the western edge of the Root project and hosts a non-JORC compliant Mineral Resource based on 1950's drilling. The deposit is being re-drilled to modern industry standards sampling NQ diamond core. Collar locations are noted below and all coordinates are in North American Datum 1983 (NAD83) Zone 15: McCombe downhole pegmatites are summarised below. The downhole intervals of the McCombe pegmatites are approximate to true widths.

		usually Material		

Criteria	JORC Code explanation	Commentary
Relationship between mineralisation widths and intercept lengths	 and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). 	 Holes drilled by GT1 attempt to pierce the mineralised pegmatite approximately perpendicular to strike, and therefore, the downhole intercepts reported are approximately equivalent to the true width of the mineralisation. Trenches are representative widths of the exposed pegmatite outcrop. Some exposure may not be a complete representation of the total pegmatite width due to recent glacial deposit cover limiting the available material to be sampled.
Diagrams	 Appropriate maps and sections (with scales) and tabulations of 	The appropriate maps are included in the announcement.

Criteria	JORC Code explanation	Commentary
	any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	• Pegmatite downhole interval summary with associated assay results are listed in Appendix C
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating	 GT1 completed a high resolution Heliborne Magnetic geophysical survey over the property in July 2022. The survey was undertaken by Propsectair using their Robinson R-44 and EC120B helicopters. Survey details, 1,201 line-km, 50m line spacing, direction 179 degrees to crosscut pegmatite strike, 50m altitude. Control lines were flown perpendicular to these lines at 500m spacing. Images have been received Total Magnetics.
Further work	 substances. The nature and scale of planned further work (eg tests for lateral 	• Further extensional drilling is currently being carried out at McCombe testing strike extents over 500m in length and downdip extensions up to 300m from the current outcrop.
