

ASX Announcement

21 February 2023

HIGH-GRADE INTERCEPT EXTENDS UNDERGROUND MINERALISATION

Numerous High-Grade Infill Results Also Received in Bottom Half of Pit Shell

Predictive Discovery Limited (ASX:PDI) ("PDI" or the "Company") is pleased to report assay results from 8 holes for 4,322m of resource definition drilling at the Bankan Gold Project in Guinea.

HIGHLIGHTS

- Deep drilling at the NE Bankan ("NEB") deposit intersects **12.85m @ 6.02g/t** from 601.4m. This is outside the current Underground Mineral Resource and extends the defined high-grade mineralisation below the US\$1,800/oz optimised resource pit shell.
- Excellent infill drilling results from the bottom half of the resource pit shell, including 32m @ 5.92g/t from 471m, 44m @ 3.64g/t from 451m and 48m @ 2.88g/t from 457m. The Mineral Resource in this area is currently classified as Inferred.
- Infill drilling is ongoing and aiming to allow the majority of NEB's Open Pit Mineral Resource to be upgraded to Indicated. This is a crucial part of the Scoping Study and is therefore a key step in PDI's strategy to secure a mining permit for the Bankan Project.
- Gradient array induced polarisation ("GAIP") surveys have commenced on the Argo ("AG") targets, located approximately 15-20km north of NEB on the major structural trend. RC drilling planned to commence following receipt of GAIP results.

Commenting on the results, Managing Director Andrew Pardey, said:

It is pleasing to see growth in the high-grade mineralisation below the resource pit shell, confirming upside potential to the current Underground Mineral Resource. We are continuing deep drilling in this area to close the gap between the base of the optimised resource pit shell and the top of the current underground inferred resource.

"NEB continues to deliver outstanding infill drilling results. Importantly, the best and highest-grade results are from the bottom part of the pit shell. These results confirm the improving grade profile of the deposit at depth and support the higher relative grade of the current Inferred Open Pit Mineral Resource.

"Infill drilling remains a key near-term focus to support further upgrading of the <mark>Mine</mark>ral Resource to Indicated. This is crucial for the Scoping Study and therefore an important part of the p<mark>erm</mark>itting process for Bankan.

"Regionally, the Bankan Project has significant potential for additional gold discoveries. Geophysics surveys are underway on the northern Argo permit, and we look forward to receiving results and commencing RC drilling at these exciting targets."

NEW DRILLING RESULTS

Extensive resource definition drilling is ongoing at Bankan in line with PDI's strategy to increase the size and improve the classification of the current Mineral Resource estimate.

Drilling results in this announcement are from diamond ("DD") drilling at the NEB deposit, and include a total of 8 holes for 4,322m.

Best results reported in this announcement include:

BNEDD0186: 32m @ 5.92g/t from 471m, incl 18m @ 8.75g/t from 484m

BNEDD0192: 44m @ 3.64g/t from 451m, incl 8m @ 11.52g/t from 461.3m

BNEDD0190: 48m @ 2.88g/t from 457m, incl 13m @ 6.13g/t from 484m

BNEDD0185: 12.85m @ 6.02g/t from 601.4m

19m @ 2.17g/t from 632m, incl 2m @ 13.85g/t from 635m

BNEDD0188: 61m @ 2.15g/t from 143m, incl 3.6m @ 7.72g/t from 156m

BNEDD0184: 22.85m @ 1.78g/t from 499.15m

15m @ 1.92g/t from 603m

BNEDD0189: 10m @ 2.66g/t from 247m

The excellent results in holes BNEDD0186, BNEDD0192 and BNEDD0190 intersected the high-grade shoot in the bottom half of the resource pit shell, where the Open Pit Mineral Resource is currently classified as Inferred. These results confirm the improving grade profile of the deposit at depth and support the higher relative grade of the Inferred Open Pit Mineral Resource (2.23g/t).¹

Deep drill hole BNEDD0185 intersected high-grade gold between the base of the pit shell and the current Underground Mineral Resource, extending the defined mineralisation in this area and illustrating upside potential to the current Underground Mineral Resource estimate.

The long section and drill plan for NEB are shown in Figure 1 and Figure 2 respectively, with cross sections and additional commentary included in subsequent pages.

¹ Refer to Compliance Statement at the end of this announcement.

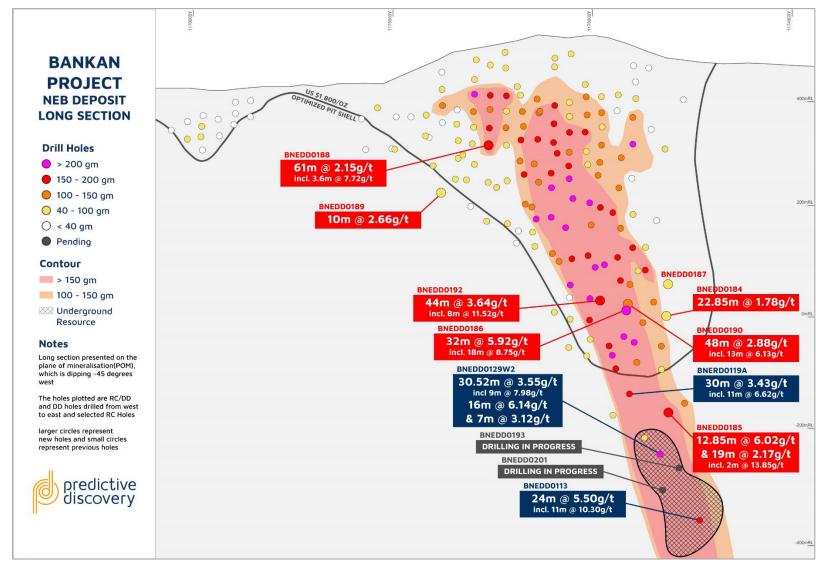

Figure 1: NEB long section view, showing newly reported DD holes (red callouts). Shown in blue callouts are previously reported DD holes below the optimised pit shell. Deep holes in progress are shown in grey.

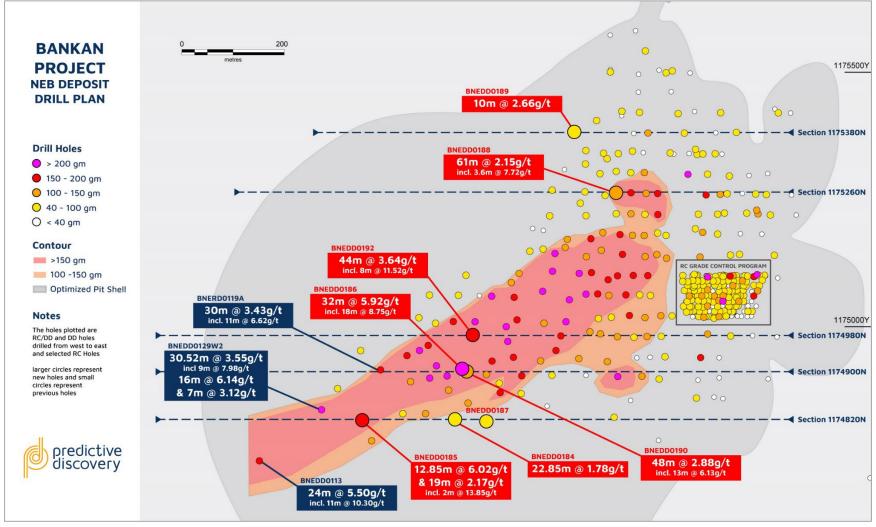

Figure 2: NEB drill plan, showing new DD results (red callouts) and previously reported DD holes below the optimised pit shell (blue callouts).

The southern-most cross section presented shows new results reported for BNEDD0184, BNEDD0185 and BNEDD0187. BNEDD0185 is the deepest intercept on section and hosts 12.85m @ 6.02g/t from 601.4m on the main shear zone ("STMZ"). On section, this intercept is 105m down-dip from the resource pit shell and 50m up-dip from the current boundary of the Underground Mineral Resource. BNEDD0185 also hosts secondary intercepts of 19m @ 2.17g/t from 632m and 6.4m @ 2.22g/t from 684.8, which is on the footwall splay ("FW Splay") and links down-dip into 16m @ 6.14g/t in BNEDD0129W2.²

The intercepts in BNEDD0185 are beginning to bridge the gap between base of the pit shell and the sub-pit shoots on STMZ and FW Splay, and therefore illustrate upside potential to the current Underground Mineral Resource of 335Koz @ 4.75g/t.³ Both STMZ and FW Splay shoots remain open at depth on cross section and long section.

BNEDD0184 hosts 22.85m @ 1.78g/t up-dip on the STMZ on the mafic-tonalite contact ("MTC"). BNEDD0187 hosts 6.4m @ 1.27g/t on the STMZ.

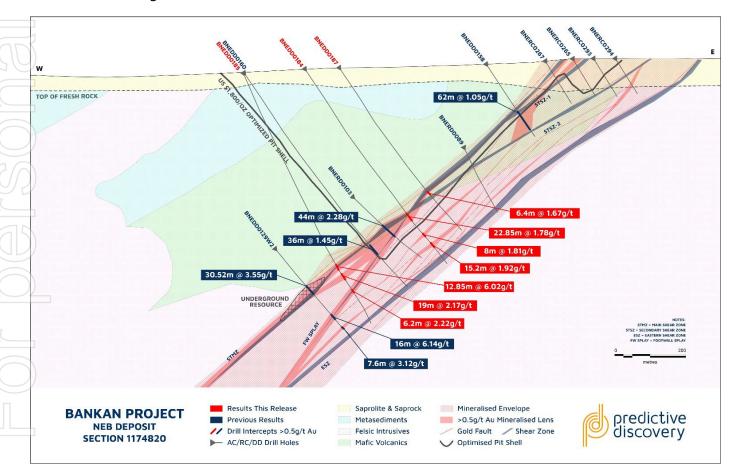

Figure 3: Section 1174820N (+20mN/- 20mS)

² ASX Announcement – High Grade Gold 200m Below NE Bankan's 3.9Moz Resource (29 September 2022).

³ Refer to Compliance Statement at the end of this announcement.

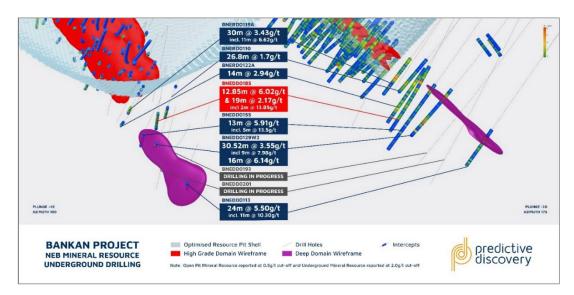

Figure 4: BNEDD0185 shown in relation to the High Grade and Deep domain wireframes and other deep drill holes.

This section hosts two of the best reported intercepts, with 32m @ 5.92g/t from 471m including 18m @ 8.75g/t from 484m in BNEDD0186 and 48m @ 2.88g/t from 457m including 13m @ 6.13g/t from 463m in BNEDD0190. These intercepts are adjacent and hosted on the STMZ in an area of Inferred Mineral Resource, infilling a gap between 54m @ 3.62g/t from 511m in BNERD0099 4 and 38m @ 2.55g/t from 456m in BNEDD0120. 5

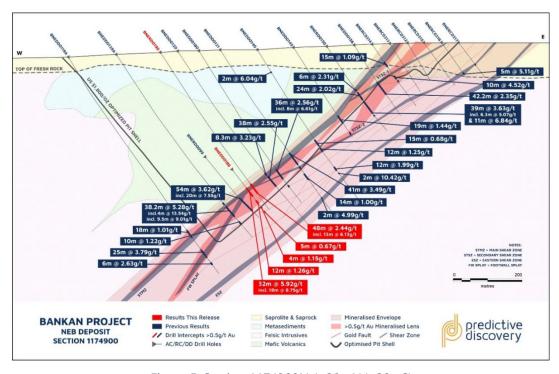

Figure 5: Section 1174900N (+20mN/- 20mS)

⁴ ASX Announcement – Further Depth Extension to Bankan High-Grade Gold (22 November 2021).

⁵ ASX Announcement – Impressive Gold Hits Continue at 4.2Moz Bankan Gold Project (25 August 2022).

Section 1174980N hosts BNEDD0192 which reported 44m @ 3.64g/t from 451m including 8m @ 11.52g/t from 461.3m. BNEDD0192 intercepted the main STMZ shoot 90m down-dip from BNERD0093 which reported 35.7m @ 6.08g/t from 397.3m including 5.5m @ 25.57g/t from 400m and 2m @ 20.55g/t from 409m.⁶ The Mineral Resource in this area is currently classified as Inferred. Additional holes are in progress or have assays pending to infill the drilling pattern towards the bottom of and below resource pit shell.

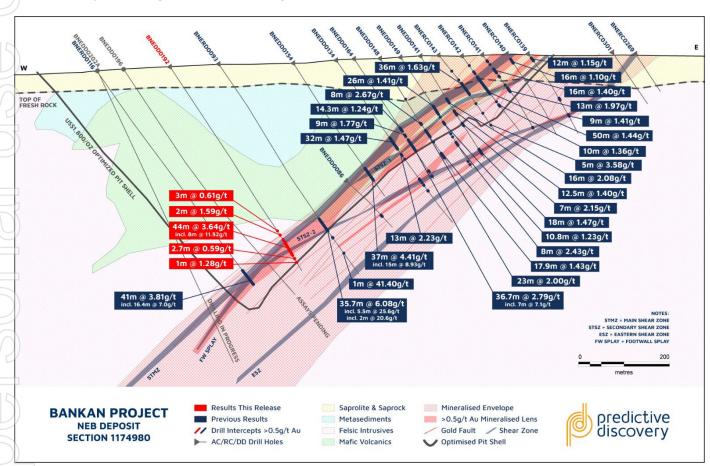

Figure 6: Section 1174980N (+20mN/- 20mS)

⁶ ASX Announcement – NE Bankan High-Grade Gold Zone Reinforced and Extended (19 October 2021).

Section 1175260N hosts 61m @ 2.15g/t from 143m including 3.6m @ 7.72g/t from 156m in BNEDD0188, which is 50m down-dip from an early intercept of 55m @ 2.94g/t from 97m in KKODD011.⁷ BNEDD0188 is in the part of the deposit where the Mineral Resource is already classified as Indicated.

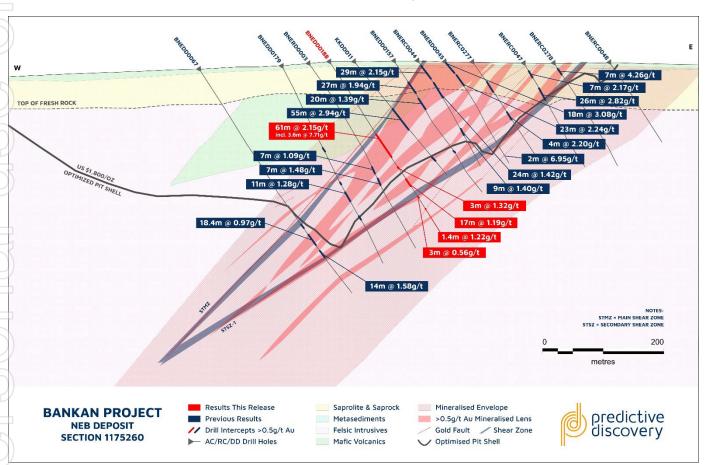

Figure 7: Section 1175260N (+20mN/- 20mS)

⁷ ASX Announcement – 55m at 2.94g/t Gold – Broad True Widths Confirmed at Bankan, Guinea (10 September 2020).

BNEDD0189 hosts 10m @ 2.66g/t in the deepest hole on this section, extending the mineralisation below the current resource pit shell. Further step-down drilling will be considered as a follow-up based on new positive surrounding results.

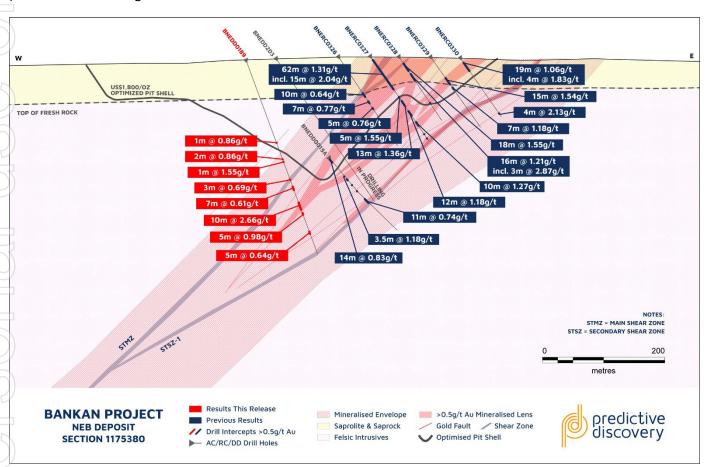

Figure 8: Section 1175380N (+20mN/- 20mS)

NEXT STEPS

There are currently six active DD rigs focused on resource definition drilling in line with the Company's strategy to further increase the size and improve the classification of the 4.2Moz Mineral Resource.⁸

Infill drilling within the pit shell will continue to be a key focus to enable the majority of the NEB Open Pit Mineral Resource to be upgraded to Indicated during 2023, which is crucial to support the Scoping Study mine plan and future permitting discussions with the Government of Guinea. The Scoping Study and ESG studies are on track to be completed by late 2023.

One DD rig is focused on deeper resource extension drilling of the current Underground Mineral Resource estimate of 335Koz @ 4.75g/t (Inferred).⁸ There is upside potential to continue extending the boundaries of mineralisation defined by drilling to date, and up-dip towards the base of the optimised resource pit shell. The Underground Mineral Resource also remains open at depth below hole BNERD0113 (24m @ 5.5g/t from 850m, including 11m @ 10.3g/t from 852m).⁹

Resource extension drilling is also planned around the northern resource pit shell which is open along strike and at depth, and at the BC deposit which is open at depth and in all directions.

PDI strengthened its exploration team in late 2022, including the appointment of a dedicated regional head geologist, to support an increasing focus on near-resource and regional exploration, where there is potential to discover other major gold deposits.

Geophysics surveys, including gradient array induced polarisation surveys, have commenced on the northern Argo ("AG") permit at targets located 15-20km north of NEB along the highly prospective structural trend. RC drilling of select targets is planned to commence immediately following receipt of the geophysics results.

Additional near-resource exploration will continue at identified targets near the NEB and BC deposits.

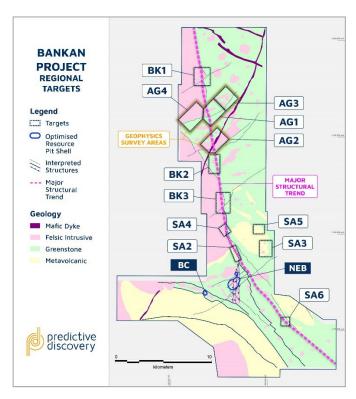

Figure 9: Bankan Project permits showing regional targets and planned geophysics survey areas on the AG permit.

- END -

⁸ Refer to Compliance Statement at the end of this announcement.

⁹ ASX Announcement – Deepest Hole to Date Intercepts Gold 630m Down Dip (15 June 2022).

ABOUT PREDICTIVE DISCOVERY

PDI's strategy is to identify and develop gold deposits within the Siguiri Basin, Guinea. The Company's key asset is the Tier-1 Bankan Gold Project. A Mineral Resource of 4.2Moz has been defined to date at the NEB (3.85Moz) and BC (331Koz) deposits, ¹⁰ making Bankan the largest gold discovery in West Africa in a decade.

PDI's focused on sustainably developing Bankan into a Tier-1 gold mine. The Company is aiming to further increase the size and improve the classification of the current Mineral Resource, and complete a Scoping Study and ESG workstreams by late 2023 as crucial steps towards securing a mining permit for the Project.

The Bankan Project is highly prospective for additional discoveries. PDI is also exploring targets near the NEB and BC deposits, and regionally to the north along the 35km gold super structure which runs through the permits.

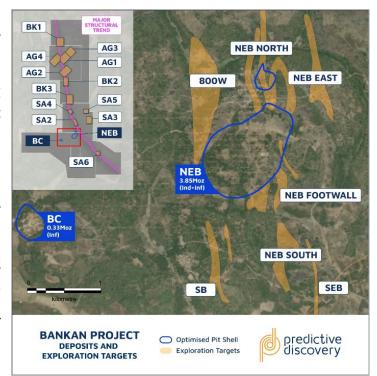

Figure 10: Bankan Project deposits and targets

COMPETENT PERSONS STATEMENT

The exploration results reported herein are based on information compiled by Mr Norm Bailie, who is a Fellow of The Australasian Institute of Mining and Metallurgy. Mr Bailie is a full-time employee of the company and has sufficient experience relevant to the style of mineralisation and type of deposits being considered to qualify as a Competent Person as defined by the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Bailie consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

 $^{^{\}rm 10}$ Refer to Compliance Statement at the end of this announcement.

COMPLIANCE STATEMENT

The information in this announcement that relates to the previous mineral resource estimate is from the announcement titled "45% Of NEB'S 3.85Moz Mineral Resource Upgraded to Indicated" dated 6 February 2023. The estimate is summarised in the table below.

Deposit	Classification	Cut-off (g/t Au)	Tonnes (Mt)	Grade (g/t Au)	Contained (Koz Au)
	Indicated	0.5	42.7	1.27	1,747
NEB Open Pit	Inferred	0.5	24.7	2.23	1,768
	Total		67.4	1.62	3,515
NEB Underground	Inferred	2.0	2.2	4.75	335
NEB Total			69.6	1.72	3,850
BC Open Pit	Inferred	0.5	7.2	1.43	331
Total Bankan Project			76.8	1.69	4,181

The information in this announcement that relates to the previous exploration results have been cross referenced to the original announcement or are from announcements listed in the table below.

APPENDIX 2: JORC CODE – DIAMOND DRILLING

Criteria	JORC Code Explanation	Commentary
Sampling Technique	Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	Samples assayed were cut diamond drill ("DD"). Core was cut in half with a core saw where competent and with a kn in soft saprolite in the upper sections of the DD holes. Sampling was supervised by qualified geologists. The majority of samples are 1m downhole, with diamond core sampling intervals breaking at lithological contacts where appropriate. Samples were dried, crushed and pulverised at the SGS laboratory in Bamako to produce a 50g fire assay charge.
Drilling	Drill type (eg core, reverse circulation, open- hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face- sampling bit or other type, whether core is oriented and if so, by what method, etc).	Drill holes included in this announcement were from DD rigs (EDM 2000 MP, Comacchio CXT15 MP and UDR 200DLS rigs). Diamond drilling was a combination of PQ, HQ and NQ core. Core was oriented using WELLFORCE orientation tools.
Drill Sample Recovery	Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	Core recoveries were recorded by dividing the total length of core returned from each run by the length of the run. Overall core recoveries averaged 92%, with the poorest recoveries (averaging 82% in the first 40m of the drillholes. No relationship between sample recovery and grade has been analysed.

Whether core and chip samples have been geologically and All drill samples were logged systematically for lithology, weathering, Logging geotechnical logged to a level of detail to support alteration, veining, structure and minor minerals. Minor minerals were appropriate Mineral Resource estimation, mining studies estimated quantitively. The Competent Person considers that the and metallurgical studies. availability of qualitative and quantitative logging has appropriately informed the geological modelling, including weathering and Whether logging is qualitative or quantitative in nature. oxidation, water table level and rock type. Core (or costean/Trench, channel, etc) photography. Photographs have been taken of each core tray. The total length and percentage of the relevant intersections logged. A WELLFORCE core orientation device was employed on all drilled core enabling orientated structural measurements to be taken. The Competent Person considers that the level of detail is sufficient for the reporting of Mineral Resources. The DD samples were collected by longitudinally splitting core using a Sub-Sampling If core, whether cut or sawn and whether quarter, half or all **Technique and Sample** core saw or a knife where core was very soft and clayey. Routine core taken. Preparation samples were half-core, with predetermined diamond core duplicates If non-core, whether riffled, tube sampled, rotary split, etc being quarter-core. The sampling method is considered adequate for and whether sampled wet or dry. a DD program of this type. For all sample types, the nature, quality and appropriateness Field duplicate results demonstrated no bias in the sample results. of the sample preparation technique. There is considerable scatter in the diamond duplicate pairs suggesting that the mineralisation is likely to be highly variable at a Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. short scale, and this variability needs to be taken into account when planning future sampling programs. Measures taken to ensure that the sampling is Sample sizes are considered to be appropriate to the grain size of the representative of the in situ material collected, including for material being sampled. instance results for field duplicate/second-half sampling Whether sample sizes are appropriate to the grain size of the material being sampled. All samples were assayed by SGS technique FAA505 for gold with a **Quality of Assay Data** The nature, quality and appropriateness of the assaying and and Laboratory Tests laboratory procedures used and whether the technique is detection limit of 5ppb Au. All samples with gold values exceeding considered partial or total. 10g/t Au were re-assayed using SGS method FAA515 with a detection limit of 0.01q/t Au. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the Field duplicates, standards and blank samples were each submitted analysis including instrument make and model, reading for every 15 samples on a rotating basis. times, calibrations factors applied and their derivation, etc. Diamond core duplicates were obtained by cutting the half core Nature of quality control procedures adopted (eg standards, sample into two quarter core samples. As samples are not blanks, duplicates, external laboratory checks) and whether homogenised, some variation is expected. acceptable levels of accuracy (ie lack of bias) and precision have been established. Duplicate and standards analysed were all within acceptable limits of expected values. Analysis of this QAQC data demonstrated that the data is of acceptable quality to be used for Mineral Resource estimation. Verification of The verification of significant intersections by either At this stage, the intersections have not been verified independently. **Sampling and Assaying** independent or alternative company personnel. A number of DD holes have been completed sufficiently close to The use of twinned holes. previously drilled holes to provide confirmation of the location of mineralisation.

The verification of significant intersections by either independent or alternative company personnel.

Discuss any adjustment to assay data.

Drillhole logging is completed on paper sheets and manually entered into a database on site. The data is managed by a company employee,

electronically from the assay laboratory and are merged into the assay

No adjustments or corrections have been made to any assay interval

who checks for data validation. Assay results are returned

data. All intercepts are reported as drilled

table of the database.

Sample Security	The measures taken to ensure sample security.	Core trays and RC chips are stored in a guarded location close to the nearby Bankan Village. Coarse rejects and pulps will be eventually recovered from SGS in Bamako and stored at PDI's field office in Kouroussa.
Orientation of Data in Relation to Geological Structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	Most of the drilling at NEB is orientated at as close as possible orthogonal to the dip and strike of the mineralisation i.e55o. Early drilling programs were oriented to the west. When it was recognised that the mineralisation dips west, the drilling orientation was switched to east and most areas were re-drilled. An analysis of the data from east and west dipping holes showed: • The mean and median of the west dipping holes are higher that east dipping in the saprolite; • In the saprolite, the composites in the west dipping holes are more variable; • The west dipping holes in the saprolite have a larger population > 2g/t; • The mean and median of the west dipping holes are lower than east dipping in the fresh; • In the saprolite, the composites in the west dipping holes are less variable. The west dipping data was filtered from the composite dataset befor further processing, except for the laterite domain.
Data Spacing and Distribution	and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.	African GEOID Datum and WGS84 Zone 29N projection. All DD and RC holes have been surveyed by using north-seeking WELLFORCE CHAMP gyro. The deposit has largely been drilled on an 80m x 80m drill spacing which supports an Inferred Mineral Resource estimate, and is being progressively infilled to an 80m x 40m which supports an Indicated Mineral Resource estimate. A detailed 10m x 10m angled RC grade control program has been completed through a 100m section of the surface core mineralised shoot.

Section 2 Reporting of Exploration Results

Mineral Tenement and Land Tenure Status

Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.

The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.

The Bankan Gold Project consists of four *Permis de Recherce Industrielle* (*Or*) as follows:

Permit	Area	Holder
Name	(km²)	
Kaninko	98.2158	Mamou Resources SARLU
Saman	99.74845	Mamou Resources SARLU
Bokoro	99.9785	Kindia Resources SARLU
Argo	57.5422	Argo Mining SARLU

The permits are located between 9 51'00"W and 10 03 24W and between 10 32'26"N and 10'52"00N, situated to the northwest, west and southwest of the town of Kouroussa in Guinea.

		The Kaninko, Saman and Bokoro permits are held by 100% owned subsidiaries of PDI. The Argo permit is subject to a joint venture within the Australian registered holding company of Argo Mining SARLU, whereby PDI can progressively earn 90% of the holding company by payment of US\$100,000 and will acquire the remaining 10% at a decision to mine in exchange for a 2% net smelter royalty on production. The Argo permit expiry date has passed, however PDI has submitted renewal documents that have been registered by the Ministry and are in process.
		Parts of the Kaninko and Saman permits, including the NEB and BC deposits, are situated in Buffer Zone 2 of the Upper Niger National Park. Agriculture and other multiple use activities are permitted in Buffer Zone 2, but absence any change of decree, the mining of mineral deposits is not permitted. However, there are precedents in Guinea for Mining Permits to be granted in environmentally sensitive areas (e.g. within and adjacent to the Mt Nimba World Heritage Site). PDI is currently undertaking detailed sustainability studies (including an Environmental and Social Impact Assessment) and a Scoping Study to facilitate future permitting discussions with the Government of Guinea.
Exploration Done by Other Parties	Acknowledgment and appraisal of exploration by other parties.	PDI is not aware of any significant previous gold exploration over the permit. Artisanal miners have extracted an unknown quantity of gold from shallow hand dug pits and shafts, with panning and loaming used to identify mineralized areas.
Drill Hole Information	Deposit type, geological setting and style of mineralisation. A summary of all information material to the understanding	The Bankan deposits are hosted in Paleoproterozoic rocks of the Birimian Supergroup in the Siguiri Basin, which is host to several significant large active gold mining operations. The predominant rock types consist of felsic intrusives including granite and tonalite, with mafic to intermediate volcanics and intrusives. Metasediments including marble, chert and schists have also been observed. Weathering has formed a deep saprolite profile, with a pisolitic and nodular lateritic cover which hosts remobilised gold, generally above the primary deposits or dispersed a few tens of metres laterally. Mineralisation consists of wide zones of structurally controlled chlorite, silica and sericite alteration with associated pyrite and quartz veining, emplaced during deformation of anastomosing north-south shears on the hanging-wall of a tonalitic felsic intrusive, which has intruded a mafic and sedimentary greenstone sequence. The mineralisation is found largely in a corridor between two moderately west dipping shears (the Main and Eastern Shears) with shallower dipping linking structures. The mineralisation is preferentially developed at the Main Shear, especially around the contact between the footwall tonalite and the overlying mafic/metasediment package. Higher grades are found in a steeply SW plunging shoot; a second high grade shoot down plunge of the main shoot has been identified by three drillholes and is the target of current extensional drilling. See Appendix 1.
Drill Hole Information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: • easting and northing of the drill hole collar • elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar • dip and azimuth of the hole • down hole length and interception depth • hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	See Appendix 1.

	Data Aggregation Methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.	DD sampling was generally in 1m intervals. Up to 2m (down-hole) of internal waste is included for results reported at the 0.5g/t Au cut-off grade.
		Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	Mineralised intervals are reported on a weighted average basis.
	/	The assumptions used for any reporting of metal equivalent values should be clearly stated.	
15	Relationship Between Mineralisation Widths and Intercept Lengths	These relationships are particularly important in the reporting of Exploration Results	The drilling targets the west dipping mineralised NEB shoot orthogonally and at constant dip of -550 and drill pattern of 40m sections and 80m spaced drill intercepts.
)	If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.	Intercepts are as close to true width as physically possible.
		If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	
	Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Appropriate maps and sections are included in this release.
	Balanced Reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	Comprehensive reporting of the drill results is provided in Appendix
	Other Substantive Exploration Data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All other exploration data on this area has been reported previously by PDI.
15	Further Work	The nature and scale of planned further work (eg tests for lateral extensions or large scale step out drilling.	NEB is open at depth for the majority of its strike length, and along strike to the north. Additional infill drilling will be completed within the open pit shell to further improve the resource classification from
		Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Inferred. Step out drilling will be planned to the north along strike an at depth, around the underground resource and selected structural targets along the main shear to add to the total resource.
