

CASTILLO COPPER Exploration with Purpose

## Encouraging REE metallurgy test-work from Broken Hill

## Highlights

- Preliminary metallurgical test-work on a 20 m composite sample from the Fence Gossan Prospect (FG_003RC) delivered encouraging results, with clays - subjected to froth flotation - obtaining up to 2-3 times rare earth element (REE) enrichment from the head grade at up to $70 \%$ recovery:
* These findings confirm REEs can be readily separated from clay within the East Zone discovery area and potentially beneficiated to a higher grade concentrate
- To acquire a deeper understanding of the potential to extract REE-mineralisation from clays in the East Zone discovery area, the Board has approved appointing a specialist consultancy to conduct an in-depth metallurgy test-work program:
* Once completed and interpreted, the results from this program will be key to securing interest from potential off-take partners and providing a path to market
- Further, 1 m re-assays for Reefs Tank were received for all four drill-holes (RT_0014RC), which further verified there is an extensive, shallow REE system apparent across the central part of the East Zone - the best intercept comprised:

3m @ 2,587ppm TREO from 14m (RT_001RC)

- Reconciling all assays from the recent drilling and auger campaigns across the Fence Gossan, Tors \& Reefs Tanks Prospects, the geology team has created heat maps which identify zones of high Total and Magnetic Rare Earth Oxides (TREO/MREO):
* These areas will be subject to further surface sampling and geophysical surveys then potentially drill-testing to extend known mineralisation

> Castillo Copper's Chairman Ged Hall commented: "On a holistic basis, the Board is delighted with results from the drilling, surface sampling and metallurgical test-work at Broken Hill as they collectively demonstrate the forward value creating potential of the BHA Project's East Zone. In short, the underlying REE system is shallow, extends over at least 4.5km", delivered results up to 3,491ppm TREO and produced up to 38.9\% MREO in diamond core'. Moreover, the metallurgy test-work proves REE mineralisation readily separates from clay and can potentially be beneficiated to a higher-grade concentrate. By all accounts, this is an excellent report card ahead of exploratory work ramping up."

## ENCOURAGING METALLURGICAL TEST-WORK RESULTS

Castillo Copper Limited's ("CCZ") Board is delighted with the initial REE metallurgical test-work results from a 20m composite sample (FG_003RC) from the Fence Gossan Prospect (Appendix A). The sample, which comprised clays - was subjected to froth flotation - delivered up to 2-3 times REE enrichment from the head grade at up to $70 \%$ recovery (refer Figure 1 and Appendix B for full details). Moreover, these findings verify that REEs can be readily separated from clay within the East Zone discovery area and potentially beneficiated to a higher-grade concentrate.

FIGURE A1: HEAD ASSAY / IMPROVEMENT

| ANALYTE | ALS <br> Adelaide <br> REE ME- <br> MS81 <br> $\%$ | ALS Perth <br> HEAD <br> GRADE <br> REE COMP <br> $\%$ | Times <br> Improvement |
| :--- | :---: | :---: | :---: |
| Ce (\%) | 0.045 | 0.05 |  |
| La (\%) | 0.038 | 0.03 | 1.6 |
| Nd (\%) | 0.021 | 0.02 | 2.3 |
| $\mathbf{P r}(\%)$ | 0.006 | 0.01 | 2.0 |
| $\mathbf{Y}$ (\%) | 0.009 | 0.01 | 1.3 |

Source: ALS
To follow up on these excellent results, the Board has now approved the appointment of a specialist metallurgy consultancy with extensive experience in how REE mineralisation liberates from various host rocks (including clays). The Board wants a deeper understanding of the potential to extract REE mineralisation from the East Zone discovery area, as this information will be key to securing interest from potential off-take partners that can provide a clear path to market.

## Reefs Tank Assays

All 1m re-assays for Reefs Tank were received for the four drill-holes (RT_001-4RC), with up to 2,587ppm TREO recorded (Figure 1). On a holistic basis, the Reefs Tank results provide incremental evidence there is an extensive, shallow REE system apparent across the central part of the BHA Project's East Zone (Appendix A).

## TREO / MREO Contours

After reconciling all assays from the recent drilling and auger campaigns across the Fence Gossan, Tors \& Reefs Tanks Prospects (Appendix B), the geology team has created heat maps which identify zones of high TREO and MREO (Figure 2 \& 3).
These areas will be subject to further surface sampling and geophysical campaigns (including trial transects of ground radiometric and EM surveys) then potentially drill-testing (red zones in Figure 2) to extend known mineralisation.

Note, the TREO is the sum of REEs in ppm, calculated from ME-MS81 method, converted to their stoichiometric equivalent i.e., Ce converted to $\mathrm{CeO}_{2}$ and so forth. The high-value Magnetic REO comprise $\mathrm{Nd}+\mathrm{Pr}+\mathrm{Dy}+\mathrm{Tb}$ and generally command premium pricing to other REEs as they are in strong demand. Refer to Appendix C for a full explanation and TREO calculation.

## Competent Person's Statement

The information in this report that relates to Exploration Results and Mineral Resource Estimates for "BHA Project, East Zone" is based on information compiled or reviewed by Mr Mark Biggs. Mr Biggs is a director of ROM Resources, a company which is a shareholder of Castillo Copper Limited. ROM Resources provides ad hoc geological consultancy services to Castillo Copper Limited. Mr Biggs is a member of the Australian Institute of Mining and Metallurgy (member \#107188) and has sufficient experience of relevance to the styles of mineralisation and types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, and Mineral Resources. Mr Biggs holds an AusIMM Online Course Certificate in 2012 JORC Code Reporting. Mr Biggs also consents to the inclusion in this report of the matters based on information in the form and context in which it appears.

The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

## About Castillo Copper

Castillo Copper Limited is an Australian-based explorer primarily focused on copper across Australia and Zambia. The group is embarking on a strategic transformation to morph into a mid-tier copper group underpinned by its core projects:

A large footprint in the in the Mt Isa copper-belt district, north-west Queensland, which delivers significant exploration upside through having several high-grade targets and a sizeable untested anomaly within its boundaries in a copper rich region.

Four high-quality prospective assets across Zambia's copper-belt which is the second largest copper producer in Africa.

A large tenure footprint proximal to Broken Hill's world-class deposit that is prospective for cobalt-zinc-silver-lead-copper-gold and platinoids.

Cangai Copper Mine in northern New South Wales, which is one of Australia's highest grading historic copper mines.

The group is listed on the LSE and ASX under the ticker "CCZ."

## APPENDIX A: BHA PROJECT'S EAST ZONE

FIGURE A1: BHA PROJECT's EAST ZONE - REE EXPLORATION FOOTPRINT

FIGURE A2: BHA PROJECT

Source: CCZ geology team

## APPENDIX B: PRELIMINARY METALLURGY TESTWORK

## Background and Scope

A composite sample of RC chips from Fence Gossan drill-hole FG_003RC was constructed over the interval from $0-20 \mathrm{~m}$. The material reported over that interval had lithology logged as clay, haematite, goethite, and extremely weathered pegmatite. The main rare-containing minerals are thought to be monazite, allanite, xenotime, and possibly baryte or celsian (to account for the high barium contents of some samples). Note, these assumptions need to be tested by XRD and/or QEM-SEM testing.

The composite was made up of 1 m samples tested using ME-MS81 analysis method (the results for which are provided in Figure A1).

The process methodology followed by ALS Perth was as follows:

- Rotary Blending \& Splitting (12x1kg, reserve)
- PPS - Head Assay Submission
- Assay - Head Assay (Ce, La, Nd, Pr, $\mathrm{SiO}_{2}, \mathrm{Y}$ )
- 1kg Grind Establishment (P80 53 $\mu \mathrm{m}$ assumed)
- Rougher Flotation (6 con, 1 Tail)
- PPS - Float Products
- Assay - Head Assay (Ce, La, Nd, Pr, $\mathrm{SiO}_{2}$, and Y )

## Results

The head grade and froth flotation improvement are shown in Figure A1.

## FIGURE A1: HEAD ASSAY / IMPROVEMENT

Source: ALS
Overall main laboratory observations of note are:

- Slurry was highly viscous after ALS Perth added lime that changed the target pH down to 9.5. The process was changed to soda ash in the second test.
- By end of float, ALS Perth saw froth instability, which indicates what material wanted to float.
- There was a colour trend in the concentrate progressing through the stages.

Figures A2 to A5 show cumulative recovery versus grade for the $\mathrm{Ce}, \mathrm{La}, \mathrm{Nd}$, and Pr components.

## APPENDIX D: JORC CODE, 2012 EDITION - TABLE 1 - FENCE GOSSAN SURFACE SAMPLING

## Section 1: Sampling Techniques and Data

| Criteria | JORC Code explanation |
| :---: | :---: |
| Sampling techniques | Nature and quality of sampling (e.g., cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling. <br> Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. <br> Aspects of the determination of mineralisation that are Material to the Public Report. <br> In cases where 'industry standard' work has been done this would be relatively simple (e.g., 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. |

|  |  | $0.1-0.5 \mathrm{~m}$. Original samples were between $0.5-2 \mathrm{~kg}$ in weight, reduced to 200 g for crushing and pulverizing. The Stage 1 program consisted of 189 sampling stations, spaced at 200 m intervals across a total survey area measuring $6.4 \mathrm{~km}^{2}$ <br> The first area was based about the centre of the grid, closest to the known points of observations (drill holes FG001RC-4RC). Stations extended east of the Resource Mask to the EL8434 lease boundary. Stations also extended west to identify extension of REEs into the Reef Tank Resource Area. Station numbers are based on a wider grid that incorporates Reef Tank and Tors Tank. <br> A Stage 2 second area at a larger spacing ( 400 m ) was completed slighter later in December 2022, which managed to collect another 21 samples over mainly pegmatite outcrop. |
| :---: | :---: | :---: |
| Drilling techniques | Drill type (e.g., core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g., core diameter, triple or standard tube, depth of diamond tails, facesampling bit or other type, whether core is oriented and if so, by what method, etc.). | Historical drilling consisted of auger, rotary air blast, reverse circulation, and $\mathrm{NQ}, \mathrm{BQ}$, and HQ diamond coring. One cored hole of HQ ( 61 mm ) diameter was completed at Tors Tank after all the RC holes had been completed. <br> Diamond drilling was completed with standard diameter, conventional HQ, with historical holes typically utilizing RC and percussion precollars to an average 30 metres (see drillhole information for further details). |
| Drill sample recovery | Method of recording and assessing core and chip sample recoveries and results assessed. <br> Measures taken to maximise sample recovery and ensure representative nature of the samples. <br> Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | Reverse Circulation ('RC') Drilling - Reverse circulation sample recoveries were visually estimated during drilling programs. Where the estimated sample recovery was below $100 \%$ this was recorded in field logs by means of qualitative observation. <br> Reverse circulation drilling employed sufficient air (using a compressor and booster) to maximise sample recovery. Historical cored drillholes by North Broken Hill, CRA, and Pasminco were well documented and generally have $>90 \%$ core recovery. |

$\left.\begin{array}{|l|l|l|l} & & \text { No relationship between sample recovery and grade has been } \\ \text { observed. }\end{array}\right]$

Quality of assay data and laboratory tests

The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.

For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.

Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.

The following rare earth elements were analysed using ME-MS61R Sample Decomposition is by HF- $\mathrm{HNO}_{3}-\mathrm{HClO}_{4}$ acid digestion, HCl leach (GEO-4A01). The Analytical Method for

Silver is shown below:

| Element | Symbol | Units | Lower <br> Limit |
| :--- | :--- | :--- | :--- | | Upper |
| :--- |
| Limit |

## Inductively Coupled Plasma - Atomic Emission Spectroscopy (ICP - AES) Inductively Coupled Plasma - Mass Spectrometry (ICP-MS)

A prepared sample $(0.25 \mathrm{~g})$ is digested with perchloric, nitric, hydrofluoric, and hydrochloric acids. The residue is topped up with dilute hydrochloric acid and analysed by inductively coupled plasma atomic emission spectrometry. Following this analysis, the results are reviewed for high concentrations of bismuth, mercury, molybdenum, silver, and tungsten and diluted accordingly.

Samples meeting this criterion are then analysed by inductively coupled plasma-mass spectrometry. Results are corrected for spectral interelement interferences.

Four acid digestions can dissolve most minerals: however, although the term "near total" is used, depending on the sample matrix, not all elements are quantitatively extracted.

Results for the additional rare earth elements will represent the acid leachable portion of the rare earth elements and as such, cannot be used, for instance to do a chondrite plot.

## Geochemical Procedure

Element geochemical procedure reporting units and limits are listed below:
(1)

- Laboratory inserted standards, blanks and duplicates were analysed per industry standard practice. There was no evidence of bias from these results.
- Two of the drillholes have been twinned, at Tors Tank where TT_005DD was drilled next to TT_003RC.
- Conversion of elemental analysis (REE parts per million) to stoichiometric oxide (REO parts per million) was undertaken by ROM geological staff using the below element to stoichiometric oxide conversion factors
(https://www.jcu.edu.au/news/releases/2020/march/rare-earth-metals-an-untapped-resource)

Table C1-1: Element -Conversion Factor -Oxide Form

|  |  | Rare earth oxide is the industry accepted form for reporting rare earths. The following calculations are used for compiling REO into their reporting and evaluation groups: <br> TREO (Total Rare Earth Oxide) $=\mathrm{La}_{2} \mathrm{O}_{3}+\mathrm{CeO}_{2}+\mathrm{Pr}_{6} \mathrm{O}_{11}+\mathrm{Nd}_{2} \mathrm{O}_{3}$ $+\mathrm{Sm}_{2} \mathrm{O}_{3}+\mathrm{Eu}_{2} \mathrm{O}_{3}+\mathrm{Gd}_{2} \mathrm{O}_{3}+\mathrm{Tb}_{4} \mathrm{O}_{7}+\mathrm{Dy}_{2} \mathrm{O}_{3}+\mathrm{Ho}_{2} \mathrm{O}_{3}+\mathrm{Er}_{2} \mathrm{O}_{3}+$ $\mathrm{Tm}_{2} \mathrm{O}_{3}+\mathrm{Yb}_{2} \mathrm{O}_{3}+\mathrm{Y}_{2} \mathrm{O}_{3}+\mathrm{Lu}_{2} \mathrm{O}_{3}$. <br> TREO-Ce $=$ TREO $-\mathrm{CeO}_{2}$ <br> LREO (Light Rare Earth Oxide) $=\mathrm{La}_{2} \mathrm{O}_{3}+\mathrm{CeO}_{2}+\mathrm{Pr}_{6} \mathrm{O}_{11}+\mathrm{Nd}_{2} \mathrm{O}_{3}$ $+\mathrm{Sm}_{2} \mathrm{O}_{3}$ <br> HREO (Heavy Rare Earth Oxide) $=\mathrm{Eu}_{2} \mathrm{O}_{3}+\mathrm{Gd}_{2} \mathrm{O}_{3}+\mathrm{Tb}_{4} \mathrm{O}_{7}+$ <br> $\mathrm{Dy}_{2} \mathrm{O}_{3}+\mathrm{Ho}_{2} \mathrm{O}_{3}+\mathrm{Er}_{2} \mathrm{O}_{3}+\mathrm{Tm} 2 \mathrm{O} 3+\mathrm{Yb} 2 \mathrm{O} 3+\mathrm{Y} 2 \mathrm{O} 3+\mathrm{Lu} 2 \mathrm{O} 3$ <br> CREO (Critical Rare Earth Oxide) $=\mathrm{Nd}_{2} \mathrm{O}_{3}+\mathrm{Eu}_{2} \mathrm{O}_{3}+\mathrm{Tb}_{4} \mathrm{O}_{7}+$ <br> $\mathrm{Dy}_{2} \mathrm{O}_{3}+\mathrm{Y}_{2} \mathrm{O}_{3}$ <br> MREO (Magnetic Rare Earth Oxide) $=\mathrm{Pr}_{6} \mathrm{O}_{11}+\mathrm{Nd}_{2} \mathrm{O}_{3}+\mathrm{Sm}_{2} \mathrm{O}_{3}+$ $\mathrm{Gd}_{2} \mathrm{O}_{3}+\mathrm{Tb}_{4} \mathrm{O}_{7}+\mathrm{Dy}_{2} \mathrm{O}_{3}$. <br> Total Rare Earth Oxides (TREO): <br> To calculate TREO an oxide conversion "factor" is applied to each rare-earth element assay. The "factor" equates an elemental assay to an oxide concentration for each element. Below is an example of the factor calculation for Lanthanum (La): <br> - Relative Atomic Mass (La) $=138.9055$ <br> - Relative Atomic Mass $(\mathrm{O})=15.9994$ <br> - Oxide Formula $=\mathrm{La}_{2} \mathrm{O}_{3}$ <br> - Oxide Conversion Factor $=1 /((2 x 138.9055) /(2 x$ $138.9055+3 \times 15.9994)$ ) Oxide Conversion Factor $=$ 1.173 (3dp) <br> None of the historical data has been adjusted. |
| :---: | :---: | :---: |
| Location of data points | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. <br> Specification of the grid system used. <br> Quality and adequacy of topographic control. | In general, locational accuracy does vary, depending upon whether the historical surface and drillhole samples were digitised off plans or had their coordinated tabulated. Many samples were originally reported to AGD66 or AMG84 and have been converted to MGA94 (Zone 54) <br> The holes are currently surveyed with handheld GPS, awaiting more accurate DGPS survey. It is thus estimated that locational accuracy therefore varies between $2-4 \mathrm{~m}$ until the more accurate |

|  |  | surveying is completed. This assessment was confirmed once the holes were surveyed by DGPS from GMC Surveying. <br> The quality of topographic control (GSNSW 1 sec DEM) is deemed adequate for the purposes of the exploration drilling program. |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Data spacing and distribution | Data spacing for reporting of Exploration Results. <br> Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. <br> Whether sample compositing has been applied. | The average sample spacing from the current drilling program across the tenure varies per prospect, and sample type, as listed in Table C1-2, below: <br> Table C1-2: EL 8434 Drillhole Spacing |  |  |
|  |  | Prospect | Drillholes Completed | RMS <br> Drillhole Spacing (m) |
|  |  | The Sisters | Not yet |  |
|  |  | Iron Blow | Not Yet |  |
|  |  | Tors Tank | 4 | 127 |
|  |  | Fence Gossan | 4 | 208 |
|  |  | Ziggy's Hill | n/a | n/a |
|  |  | Reefs Tank | 4 | 221 |
|  |  | The Datamine software allows creation of fixed length samples from the original database given a set of stringent rules. <br> Sample location is shown in Figure C1. |  |  |
|  |  |  |  |  |
|  |  | Figure C1: Location of Stage 1 Fence Gossan Surface Samples |  |  |

|  |  | Samples obtained during drilling completed between 4/10/22 to the 10/10/22 were transported by exploration employees or an independent courier directly from Broken Hill to ALS Laboratory, Adelaide. <br> The Company considers that risks associated with sample security are limited given the nature of the targeted mineralisation. |
| :---: | :---: | :---: |
| Audits or reviews | The results of any audits or reviews of sampling techniques and data. | No external audits or reviews have yet been undertaken. |

## SECTION 2: REPORTING OF EXPLORATION RESULTS

## Criteria

JORC Code explanation

Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.

The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.

## Commentary

EL 8434 is located about 28km east of Broken Hill whilst EL 8435 is 16 km east of Broken Hill. Both tenures are approximately 900 km northwest of Sydney in far western New South Wales (Figures C2-1 and C2-2 in Appendix A \&B, above),

EL 8434 and EL 8435 were both granted on the 2 $2^{\text {nd of }}$ June 2016 to Squadron Resources for a term of five (5) years for Group One Minerals. On the $25^{\text {th }}$ of May 2020 , Squadron Resources changed its name to Wyloo Metals Pty Ltd (Wyloo). In December 2020 the tenure was transferred from Wyloo Metals to Broken Hill Alliance Pty Ltd a $100 \%$ subsidiary company of Castillo Copper Limited. Both tenures were renewed on the $12^{\text {th }}$ of August 2021 for a further six (6) years and are due to expire on the $2^{\text {nd }}$ of June 2027.

EL 8434 lies across two (2) 1:100,000 geology map sheets Redan 7233 and Taltingan 7234, and two (2) 1:250,000 geology map sheets, SI54-3 Menindee, and SH54-15 Broken Hill in the county of Yancowinna. EL 8434 consists of one hundred and eighty-six (186) units) in the Adelaide and Broken Hill 1:1,000,000 Blocks covering an area of approximately $580 \mathrm{~km}^{2}$.

EL 8435 is located on the $1: 100,000$ geology map sheet Taltingan 7234, and the 1:250,000 geology map sheet $\mathrm{SH} / 54-15$ Broken Hill in the county of Yancowinna. EL 8435 consists of twenty-two (22) units (Table 1) in the Broken Hill 1:1,000,000 Blocks covering an area of approximately $68 \mathrm{~km}^{2}$.

Access to the tenures from Broken Hill is via the sealed Barrier Highway. This road runs north-east to south-west through the northern portion of the EL 8434, passes the southern tip of EL 8435 eastern section and through the middle of the western section of EL 8435. Access is also through the southern section of the EL 8434. The Orange to Broken Hill Rail line also dissects EL 8435 western section the middle and then travels north-west to south-east slicing through the eastern arm of EL 8434 (Figure C2-1).

Figure C2-1: EL 8434 and EL 8435 General Location Map

Exploration done by other parties

Explorers who were actively involved over longer historical periods in various parts of EL8434 were: - North Broken Hill Ltd, CRAE Exploration, Major Mining Ltd and Broken Hill Metals NL, Pasminco Exploration Ltd, Normandy Exploration Ltd, PlatSearch NL/Inco Ltd/ EGC Pty Ltd JV and the Western Plains Gold Ltd/PlatSearch/EGC Pty Ltd JV.

A comprehensive summary of work by previous explorers was presented in Leyh (2009). However, more recently, follow-up field reconnaissance of areas of geological interest, including most of the prospective zones was carried out by EGC Pty Ltd over the various licenses. This work, in conjunction with a detailed interpretation of aeromagnetic, gravity plus RAB / RC drill hole logging originally led to the identification of at least sixteen higher priority prospect areas. All these prospects were summarized in considerable detail in Leyh (2008). Future work programs were then also proposed for each area. Since then, further compilation work plus detailed geological reconnaissance mapping and sampling of gossans and lode rocks has been carried out.

A total of 22 prospects were then recognised on the exploration licence with at least 12 occurring in and around the tenure.

With less than $45 \%$ outcropping Proterozoic terrain within the licence, this makes it very difficult to explore and is in the main very effectively screened from the easy application of more conventional exploration methodologies due to a predominance of extensive Cainozoic cover sequences. These include recent to young Quaternary soils, sands, clays and older more resistant, only partially dissected, Tertiary duricrust regolith covered areas. Depth of cover ranges from a few metres in the north to over 60 metres in some areas on the southern and central license.

Exploration by EGC Pty Ltd carried out in the field in the first instance has therefore been heavily reliant upon time consuming systematic geological reconnaissance mapping and relatable geochemical sampling. These involve a slow systematic search over low outcropping areas, poorly exposed subcrops and float areas as well as the
progressive development of effective regolith mapping and sampling tools. This work has been combined with a vast amount of intermittently acquired past exploration data. The recent data compilation includes an insufficiently detailed NSWGS regional mapping scale given the problems involved, plus some regionally extensive, highly variable, lowlevel stream and soil BLEG geochemical data sets over much of the area.

There are also a few useful local detailed mapping grids at the higher priority prospects, and many more numerous widespread regional augers, RAB, and percussion grid drilling data sets. Geophysical data sets including ground magnetics, IP and EM over some prospect areas have also been integrated into the exploration models. These are located mainly in former areas of moderate interest and most of the electrical survey methods to date in this type of terrain continue to be of limited application due to the high degree of weathering and the often prevailing and complex regolith cover constraints

Between 2007 and 2014 Eaglehawk Geological Consulting has carried out detailed research, plus compilation and interpretation of a very large volume of historic exploration data sourced from numerous previous explorers and dating back to the early 1970's. Most of this data is in non digital scanned form. Many hard copy exploration reports (see references) plus several hundred plans have been acquired from various sources, hard copy printed as well as downloaded as scans from the Geological Survey of NSW DIGS system. They also conducted field mapping, costean mapping and sampling, and rock chip sampling and analysis.

## Work Carried out by Squadron Resources and Whyloo Metals 2016 2020

Research during Year 1 by Squadron Resources revealed that the PGErich, sulphide-bearing ultramafic rocks in the Broken Hill region have a demonstrably alkaline affinity. This indicates a poor prospectivity for economic accumulations of sulphide on an empirical basis (e.g., in comparison to all known economic magmatic nickel sulphide deposits,
which have a dominantly tholeiitic affinity). Squadron instead directed efforts toward detecting new Broken Hill-Type (BHT) deposits that are synchronous with basin formation. Supporting this modified exploration rationale are the EL's stratigraphic position, proximity to the Broken Hill line of lode, abundant mapped alteration (e.g., gahnite and/or garnet bearing exhalative units) and known occurrences such as the "Sisters" and "Iron Blow" prospects.

The area overlies a potential magmatic Ni-Cu-PGE source region of metasomatised sub-continental lithospheric mantle (SCLM) identified from a regional targeting geophysical data base. The exploration model at the time proposed involved remobilization of Ni-Cu-PGE in SCLM and incorporation into low degree mafic-ultramafic partial melts during a postPaleoproterozoic plume event and emplacement higher in the crust as chonoliths/small intrusives - Voisey's Bay type model. Programs were devised to use geophysics and geological mapping to locate secondary structures likely to control and localise emplacement of Ni-Cu-PGE bearing chonoliths. Since EL8434 was granted, the following has been completed:

- Airborne EM survey.
- Soil and chip sampling.
- Data compilation.
- Geological and logistical reconnaissance.
- Community consultations; and
- Execution of land access agreements.

## Airborne EM Survey

Geotech Airborne Limited was engaged to conduct an airborne EM survey using their proprietary VTEM system in 2017. A total of 648.92-
line kilometres were flown on a nominal 200m line spacing over a portion of the project area. Several areas were infilled to 100 m line spacing.

The VTEM data was interpreted by Southern Geoscience Consultants Pty Ltd, who identified a series of anomalies, which were classified as high or low priority based on anomaly strength (i.e., does the anomaly persist into the latest channels). Additionally, a cluster of VTEM anomalies at the "Sisters" prospect have been classified separate due to strong IP effects observed in the data. Geotech Airborne have provided an IP corrected data and interpretation of the data has since been undertaken.

## Soil and Chip sampling

The VTEM anomalies were followed up by a reconnaissance soi sampling programme. Spatially clustered VTEM anomalies were grouped, and follow-up soil lines were designed. Two (2) VTEM anomalies were found to be related to culture and consequently no soils were collected. Two (2) other anomalies were sampled which were located above thick alluvium of Stephens Creek and were therefore not sampled. A line of soil samples was collected over a relatively undisturbed section at Iron Blow workings and the Sisters Prospect.

One hundred and sixty-six (166) soil samples were collected at a nominal 20 cm depth using a 2 mm aluminum sieve. Two (2) rock chips were also collected during this program. The samples were collected at either 20 m or 40 m spacing over selected VTEM anomalies. The samples were pulverised and analysed by portal XRF at ALS laboratories in Perth.

Each site was annotated with a "Regolith Regime" such that samples from a depositional environment could be distinguished from those on exposed Proterozoic bedrock, which were classified as an erosional environment. The Regolith Regime groups were used for statistical analysis and levelling of the results. The levelled data reveals strong relative anomalies in zinc at VTEM anomaly clusters 10, 12 and 14 plus strong anomalous copper at VTEM 17.

As the strata is tightly folded, the intersected cobalt-rich layers are overstated in terms of apparent thickness, however the modelling software calculates a true, vertical thickness. Cobalt mineralisation is commonly associated with shears, faults, amphibolites, and a quartz-magnetite rock within the shears, or on or adjacent to the boundaries of the Himalaya Formation. In general, most of the cobalt and rare earth element - rich layers have a north-northwest to north strike.

REE enrichment generally occurs as a 5 to 10-metre-thick zone between the completely weathered layer and strongly weathered layer and it is targeted for commercial mining (Figure D2-2). Compared to other REE deposits, regolith-hosted rare earth element deposits are substantially low-moderate grade (containing 0.05-0.3 wt.\% extractable REEs). Nevertheless, due to its easy extraction method, low processing costs and large abundance, the orebodies are generally economic to be extracted (Duuring, (2020); Kanazawa and Kamitani (2006); and Murakami, H.; Ishihara (2008)).

Figure C2-2: Weathering Profile over REE - Rich Granite

## Weathering Profile of REE-rich Granite

|  |  | https://en.wikipedia.org/wiki/Regolith-hosted rare earth element deposits <br> Weathering profile of regolith hosted REE deposits shown above, the legend is: (A) Humic layer. (B) Completely weathered layer. (C) Strongly weathered layer. (D) Weathering front. (E) Unweathered rock. <br> Most of the REE found in cerium monazite ( $\mathrm{Ce}\left(\mathrm{PO}_{4}\right)$ ) which always contains major to minor amounts of other REE (Nd, La, $\mathrm{Pr}, \mathrm{Sm}$ etc) replacing Ce . Also, the mineral often contains trace amounts of $U$ and $T h$ (coupled with Ca). This will be collaborated with XRD and or SEM analysis. |
| :---: | :---: | :---: |
| Drill hole Information | A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <br> - easting and northing of the drill hole collar <br> - elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar <br> - dip and azimuth of the hole <br> - down hole length and interception depth <br> - hole length. <br> If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. | Header information about all drillholes and surface samples completed at Tors Tank and Fence Gossan have been tabulated in this release in Appendix B. |
| Data aggregation methods | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations | No metal equivalents have been reported. Rare earth element results have been converted to rare earth oxides as per standard industry practice (Castillo Copper 2022f). |

|  | (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. <br> Where aggregate intercepts incorporate short lengths of highgrade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. <br> The assumptions used for any reporting of metal equivalent values should be clearly stated. | No compositing of assay results has taken place, but rather menu options within the Datamine GDB module have been used to create fixed length 1 m assay intervals from the original sampling lengths. <br> The rules follow very similarly to those used by the Leapfrog Geo software in creating fixed length samples. |
| :---: | :---: | :---: |
| Relationship between mineralisation widths and intercept lengths | These relationships are particularly important in the reporting of Exploration Results. <br> If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. <br> If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g., 'down hole length, true width not known'). | A database of all the historical borehole sampling has been compiled and validated. It is uncertain if there is a strong relationship between the surface sample anomalies to any subsurface anomalous intersections due to the possible masking by variable Quaternary and Tertiary overburden that varies in depth from 0-15m. The mineralisation appears to be secondary enrichment in the regolith clays and extremely weathered material derived from quartzo-feldspathic pegmatites. |
| Diagrams | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. | Current surface anomalies are shown on maps released on the ASX (Castillo Copper 2022d, 2022e, 2022f and 2022g). All historical surface sampling has had their coordinates converted to MGA94, Zone 54. |
| Balanced reporting | Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. | All recent laboratory analytical results have been recently reported (see Castillo Copper 2022a, b, c, d, e, f, and g) for assay results. <br> Regarding the surface and sampling, no results other than duplicates, blanks or reference standard assays have been omitted. |

## Other substantive exploration data

## Further work

Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.

The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).

Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.

Historical explorers have also conducted airborne and ground gravity, magnetic, EM, and IP resistivity surveys over parts of the tenure area but this is yet to be fully georeferenced (especially the ground IP surveys). Squadron Resources conducted an airborne EM survey in 2017 that covers Iron Blow and The Sisters, but not the southern cobalt and REE prospects.

## It is recommended that:

- Complete rehabilitation of the 2022 BHAE drilling campaign that comprised mostly RC drilling. An application supporting an ESF2 lodgment is yet to be approved by the NSW Resource Regulator
- The remaining non-sampled zones within the Core Library drillholes, $\mathrm{BH} 1, \mathrm{BH} 2$, and DD90-IB3 in the north of the tenure group be relogged and sampled. DD90-IB3 had 21-87m retested recently and is a good candidate for hyperspectral logging.
- A program of field mapping and ground magnetic, IP or radiometric surveys be planned and executed at Fence Gossan. Mapping of pegmatite outcrops is a high priority.
- Generate an Exploration Target for Fence Gossan to the standard of Clause 17 of the 2012 JORC Code.
- Depending upon the results of the proposed geophysical surveys and Exploration Target noted above, the next drilling program will specifically target the air coring technique over the known cobalt and REE mineralisation downdip to at least 30 m depth at all three prospects. That proposed drilling program is also designed to increase the resource confidence of the REE to Inferred Resources to the standard of the 2012 JORC Code.

Castillo Copper Limited, 2020, ASX Release Acquisition enhances BHT (zinc-silver-lead) and IOCG (gold-copper) prospectivity at Broken Hill, 1 st October 2020.
Castillo Copper Limited, 2022a, ASX Release Battery metal drill-hole assays unlock BHA East Zone potential / lithium update, 5th January 2022.

Castillo Copper Limited, 2022b, ASX Release Strategic focus to develop significant cobalt mineralisation potential at BHA Project, 9th February 2022.
Castillo Copper Limited, 2022c, ASX Release High grade platinum confirmed at BHA Project, 9th March 2022.

Castillo Copper Limited, 2022d ASX Release Diamond core tests demonstrate high-grade cobalt-zinc potential at Broken Hill, 21 March 2022
Castillo Copper Limited, 2022e ASX Release, Drilling hits targeted cobalt zones \& wide pegmatite intercepts at Broken Hill 12 October 2022
Castillo Copper Limited, 2022 f ASX Release, Drilling hits more wide pegmatite intercepts at Broken Hill, 24 October 2022

Castillo Copper Limited, 2022g ASX Release, Completed auger sampling campaign targets $6.5 \mathrm{~km}{ }^{2}$ REE mineralisation zone, 23 December 2022
