

CEL Delivers Significant High-Grade Mineral Resource Estimate of 1.6 Moz at 5.0 g/t AuEq¹ within 2.8Moz AuEq¹ at Hualilan

Highlights

- Upgraded Mineral Resource Estimate (MRE) increases to **2.8 million ounces (AuEq)¹** at CEL's flagship Hualilan Gold Project (refer Table 1).
- Significant increase in the high-grade component of this MRE conveyed by the comparison of the 2022 MRE to the higher grade 2.1 Moz AuEq component in the 2023 MRE¹ (Table 2):
 - **Upgraded 2023 MRE: 2.1 Moz at 3.1 g/t AuEq¹** (1.0 g/t AuEq cut-off)
 - **Maiden 2022 MRE: 2.1 Moz at 1.4 g/t AuEq¹** (0.25 g/t AuEq cut-off)
- Majority of the MRE now in Indicated Category (1.9 Moz AuEq¹)
- Upgrading most of the MRE to Indicated Category is a crucial step to progress the current Scoping Study and allow the option to move directly from Scoping to a Prefeasibility Study.
- 1.9 Moz AuEq¹ in Indicated Category represents 81% of the 2.3 Moz AuEq¹ "pit constrained" component of the MRE prepared for the Scoping Study.
- Resource remains open in most directions with some of the more significant intersections outside the MRE remaining open, including (refer Table 4):
 - 13.0m at 15.5 g/t AuEq¹ (FHN10-02): 600 metres south of the MRE
 - 4.0m at 5.8 g/t AuEq¹ (GNDD-308e): 600m vertically below the MRE
 - 42.0m at 5.9 g/t AuEq¹ (GNDD-711): open below this intersection
 - 32.5m at 3.5 g/t AuEq¹ (GNDD-790): open below this intersection

¹ Reported as Gold Equivalent (AuEq) values – for requirements under the JORC Code see page 2

Commenting on the resource, CEL Managing Director, Mr Kris Knauer, said

*"I would like to congratulate our Hualilan Exploration team for this outstanding result. This updated mineral resource estimate contains a core of **2.1 million ounces at a grade of 3.1 g/t AuEq** compared to our previous resource of **2.1 million ounces at 1.4 g/t AuEq**.*

*In addition to significant lift in total ounces we have added material high-grade ounces with the upgraded MRE including a higher-grade component of **1.6 million ounces at 5.0 g/t AuEq** providing significant flexibility as we progress down the path towards mining.*

Mineralisation remains open in most directions, and we expect this resource to continue to grow, however, with a total of 2.8 million ounces gold equivalent Hualilan now has critical mass to support development. Our exploration focus will now switch to exploring the previously untouched 25 kilometres of prospective strike that we hope will contain several more Hualilans.

For personal use only

Challenger Exploration (ASX: CEL) (“CEL” the “Company”) is pleased to announce an upgraded Mineral Resource Estimate (MRE) which is reported according to JORC (2012) for the Company’s flagship Hualilan Gold Project, in San Juan Argentina. This upgraded 2023 MRE is a significant increase in both total ounces and the high-grade component of the MRE. Total ounces have increased from 2.1 million ounces gold equivalent to 2.8 million ounces gold equivalent as shown in Table 1.

The Company is most pleased with the significant increase in the high-grade component of MRE. This significant increase in the grade, and the quality of the updated 2023 MRE is evident when the higher grade 2.1 Moz AuEq in 2023 MRE is compared to the 2022 MRE.

- **2022 MRE:** 2.1 million ounces at 1.4 g/t AuEq (reported at a 0.25 g/t AuEq cut-off)
- **2023 MRE:** 2.1 million ounces at 3.1 g/t AuEq (reported at a 1.0 g/t AuEq cut-off)

Importantly the upgraded MRE now contains a high-grade core of **1.6 million ounces at 5.0 g/t AuEq** (reported at a 2.0 g/t AuEq cut-off) which will drive economics and provide significant flexibility.

Upgrading a significant portion of the Mineral Resource to Indicated Category is a crucial part of progressing the Scoping Study. The 2023 MRE was based on an additional 92,000 metres of diamond core drilling of which approximately 50% (45,000 metres) comprised infill drilling. This change in strategy to significantly increase the amount of infill drilling was successful with 81% (1.9 million ounces AuEq of the current 2.3 million ounces AuEq) of the in-pit component of the MRE now in Indicated Category. A total of 67% of the 2.8 Moz upgraded MRE is in the Indicated category compared to 38% of the 2022 MRE. This will provide the Company the option to move seamlessly from Scoping Study to a Prefeasibility Study (PFS).

Mineralisation remains open in most directions and there is clear potential for the MRE to continue to grow via extension drilling.

Domain	Category	Mt	Au g/t	Ag g/t	Zn %	Pb %	AuEq g/t	AuEq (Mozs)
US\$1800 optimised shell > 0.30 ppm AuEq	Indicated	45.5	1.0	5.1	0.4	0.06	1.3	1.9
	Inferred	9.6	1.1	7.3	0.4	0.06	1.2	0.4
Below US\$1800 shell >1.0ppm AuEq	Inferred	5.5	2.1	10.7	1.0	0.06	2.6	0.5
	Total	60.6	1.1	6.0	0.4	0.06	1.4	2.8

Note: Some rounding errors may be present

Table 1 Upgraded Hualilan MRE, March 2023

¹ Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1900 Oz, Ag US\$24 Oz, Zn US\$4,000/t, Pb US\$2000/t
- Metallurgical recoveries are estimated to be Au (95%), Ag (91%), Zn (67%) Pb (58%) across all ore types (see **JORC Table 1 Section 3 Metallurgical assumptions**) based on metallurgical test work.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times 0.012106] + [Zn (\%) \times 0.46204] + [Pb (\%) \times 0.19961]$
- CEL confirms that it is the Company’s opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

COMPARISON OF 2022 MRE TO UPGRADED 2023 MRE

Total MRE	Category	Mt	Au g/t	Ag g/t	Zn %	Pb %	AuEq g/t	AuEq (Mozs)
2022 MRE (0.25 g/t cut-off)	Total	47.7	1.1	6.0	0.45	0.06	1.4	2.1
2023 MRE (1.0 g/t cut-off)	Total	21.1	2.5	10.9	1.0	0.10	3.1	2.1

Note: Some rounding errors may be present

Table 2 Comparison 2022 MRE with Upgraded MRE (reported at a 1.0 g/t Cut-off)

¹ Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1900 Oz, Ag US\$24 Oz, Zn US\$4,000/t, Pb US\$2000/t
- Metallurgical recoveries are estimated to be Au (95%), Ag (91%), Zn (67%) Pb (58%) across all ore types (see *JORC Table 1 Section 3 Metallurgical assumptions*) based on metallurgical test work.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times 0.012106] + [Zn (\%) \times 0.46204] + [Pb (\%) \times 0.19961]$
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

GRADE TONNAGE DISTRIBUTION

The high retention of metal as the cut-off grade is lifted for the upgraded MRE is illustrated in the grade tonnage relationship for the overall MRE (Table 3). Key highlights showing Resource Estimate at higher grade cut-offs are:

- 2.6 Moz at 1.8 g/t AuEq** - 44.53Mt at 1.4 g/t Au, 6.2 g/t Ag, 0.6% Zn, 0.07% Pb (0.45 g/t AuEq cut-off)
- 2.4 Moz at 2.2 g/t AuEq** - 33.5Mt at 1.8 g/t Au, 7.1 g/t Ag, 0.7% Zn, 0.08% Pb (0.6 g/t AuEq cut-off)
- 2.1 Moz at 3.1 g/t AuEq** - 21.1Mt at 2.5 g/t Au, 8.7 g/t Ag, 1.0% Zn, 0.10%Pb (1.0 g/t AuEq cut-off)
- 1.8 Moz at 4.1 g/t AuEq** - 13.6Mt at 3.4 g/t Au, 10.9 g/t Ag, 1.3% Zn, 0.12% Pb (1.5 g/t AuEq cut-off)
- 1.6 Moz at 5.0 g/t AuEq** - 9.9Mt at 4.3 g/t Au, 13.1 g/t Ag, 1.6% Zn, 0.13% Pb (2.0 g/t AuEq cut-off)
- 1.3 Moz at 6.3 g/t AuEq** - 6.4Mt at 5.9 g/t Au, 16.5 g/t Ag, 2.0% Zn, 0.15% Pb (3.0 g/t AuEq cut-off)

This grade tonnage distribution provides the Hualilan Gold project with significant flexibility to respond to a changing gold price or costs. It also provides the opportunity to evaluate a staged startup using a higher grade material.

As can be seen in Figure 3 (MRE block model in Long Section showing grade distribution) there are distinct near surface higher-grade zones of mineralisation in several locations. These zones of high-grade near surface mineralisation occur at Sentazon, Muchilera, Magnata Manto The Magnata Fault Zone, the main Norte Manto and the Sanchez Fault Zone.

HUALILAN GOLD PROJECT AND GEOLOGY

The Hualilan (local indigenous name for “land of gold”) Gold Project is located in San Juan province Argentina. All of the upgraded 2023 MRE is located on Mina's or Mining Licenses while the overall Hualilan Gold Project consists of a district scale 600 square kilometres of tenements (Figure 4).

This is held via a combination of

- 235 square kilometres granted to the Company containing the upgraded 2023 MRE; and strike extensions 5 kilometres north and south; and
- 329 square kilometres pending formal grant to the Company which has been registered to CEL in the Mining Cadastre of San Juan.

Access to the project is excellent with a double lane sealed highway covering the 120 kilometres from San Juan City, the regional capital and major mining hub, to within 400 metres from the project. San Juan City has several drilling, geophysical, and mining services companies, assay laboratories, a base of skilled mining workers contractors, and direct rail access to Rosario Port 650 kilometres away which has bulk materials handling facilities. The project is at 1200 metres elevation and both drilling and field exploration can proceed all year round.

Geology of Hualilan Gold Project

The Project is the site of extensive zinc skarn mineralisation with a gold overprint which makes it a somewhat unique style of mineralisation.

Commonly zinc skarns occur in continental settings associated convergent tectonic plate margins as is the case at Hualilan, located in the pre-cordillera of the western South American convergent plate margin. Zinc skarns commonly contain high grade zinc, lead, and silver although zinc is usually dominant. Mineralisation and skarn alteration at Hualilan occurs in all three main rock types.

1. Limestone (San Juan Formation of Ordovician age) contains high grade mineralisation (manto style) controlled by bedding parallel faults, cross faults, and contacts with other rock types.
2. Shale and sandstone (of Silurian age) contains lower grade replacement style skarn mineralisation which preferentially occurs parallel to bedding with 30m of the Limestone contact.
3. Dacitic intrusions (of Mid-Miocene age) contain stockwork fracture and locally breccias which host lower grade skarn mineralisation.

In all host rocks, the zinc skarn mineralisation is overprinted by a slightly later phase of gold – silver mineralisation. This second phase of mineralisation is mesothermal to deep epithermal and may be related to but is separate from the zinc skarn. Importantly, the gold mineralisation is deposited in the same reactivated faults and fractures as the zinc skarn. Precise mineral paragenesis and hydrothermal evolution of the deposit is the subject of on-going work which is being used to guide exploration and detailed geometallurgical test work.

For personal use only

The dacitic intrusions which are part of the host rock sequence at Hualilan may be related to the hydrothermal activity that formed the skarn, although the timing relationships have not been determined. At this stage, we use the term "intrusion-hosted" rather than "endoskarn" to describe the skarn mineralisation in the dacite.

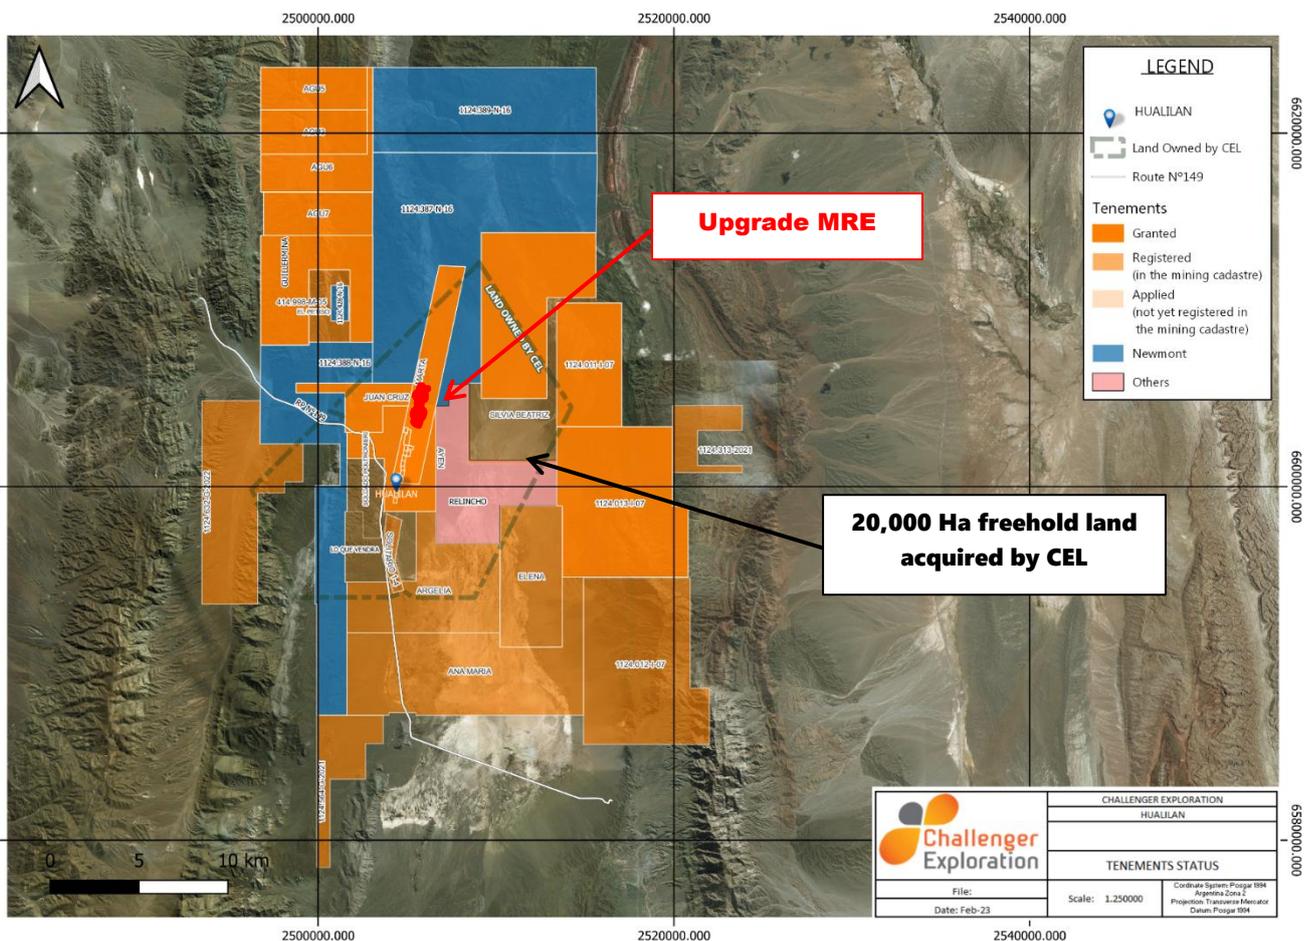

Figure 4 - Hualilan Gold Project Tenement Map

Gold occurs in native form as inclusions with sulphide (predominantly pyrite) and in pyroxene-garnet skarn alteration. The mineralisation commonly occurs with pyrite and the zinc skarn assemblage of sphalerite and galena with rare chalcocite, pyrrhotite and magnetite. Importantly, mineralisation contains very low levels of arsenic, mercury, and other deleterious metals.

Complete oxidation of the surface rock due to weathering is thin. A partial oxidation/fracture oxidation layer near surface is 1 to 40m thick and has been modelled from drill hole intersections. Where oxidation is more intense, native gold can be observed. This oxide mineralisation has been the subject of past mining at Hualilan with an unknown amount of gold having been extracted by washing and more recently by vat leach.

For personal use only

GROWTH POTENTIAL

The MRE includes data from 790 of the Company's drill holes however there remains a body of significant intercepts that are located well outside the MRE boundary or where mineralisation appears strong and open down dip and/or along strike. A selection of the more significant intersections which remain open are listed in table 4 with Cross Sections provided for context.

Table 4 - Selected intercepts outside the MRE or below which mineralisation remains open

Drillhole	Intercept (AuEq)	Comment	Gram Metres
FHNV10-1B	9.2m at 5.1 g/t AuEq (channel) inc 4.6 m at 9.5 g/t AuEq	located 600 metres south of the MRE boundary	47.2

NEXT STEPS

One drill rig is currently operating on site. This rig's focus is on extension down-dip of recent high-grade intersections that remain open and testing outlier targets. With the rig count being reduced from 9 to 1 the exploration team has been split into northern and southern regional exploration teams as the Company's focus shifts, for the first time, towards looking for the next Hualilan.

Regional exploration will be aimed at the 25 kilometres of prospective strike which remains unexplored. Early results are encouraging with alteration and surface mineralisation (assays pending) mapped in outcrop in several locations up to 5 kilometres away from the existing mineralisation. The single rig on site will be sufficient to test new regional exploration targets as they are identified and matured for drilling.

RESOURCE MODEL AND MINERAL RESOURCE ESTIMATE

Pit Optimisation Parameters

A 0.30 g/t AuEq lower cut-off grade inside an US\$1800 optimised surface shell has been used to report that part of the MRE that has reasonable prospects of future economic extraction via surface mining. The surface optimisation parameters reflect internally researched costs and assumptions for similar style projects in Argentina. To provide continuity between the 2022 ME and upgraded 2023 MRE the same optimisation parameters were used for the 2023 MRE. An input gold price of US\$1,800/oz, an assumed mining cost of US\$2.0/t, a process cost of US\$10/t, and statutory royalties of 3%.

Pit slopes of 45° on the western side and 55° on the eastern side were used in the surface optimisation scenario with the eastern pit wall in the San Juan Formation limestone being prominent hills in the district. In several open cut limestone mines in the Hualilan region, which produces the majority of the limestone in Argentina, pit walls in the San Juan Formation limestone can be up to 65°. At Hualilan, detailed geotechnical work has yet to be completed.

The average metallurgical recoveries used for gold (94.9%), silver (90.9%), zinc (89%), and lead (77%) were derived by the scoping study level of metallurgical testing that has been completed involving 33 flotation tests across 6 bulk composite samples representative of all ore types. For the purposes of calculating gold equivalent recovery for Zn and Pb credits was only factored into the high-grade skarn component of the resource. Payabilities were taken from ongoing discussions the company has had with concentrate off-takers including smelters and trades. The gold equivalents reflect the updated metal recoveries.

Resources below the optimised surface shell have been reported as Inferred Resource at a 1 g/t AuEq cut off given the grade, distribution, orientation, and dimensions of the underground mineralisation is considered to have reasonable prospects of future economic extraction via an underground mining technique.

Mineral Resource Estimate Model

The Hualilan MRE has been generated from all available CEL diamond drill holes for which final assays had been returned up to end of February 2023 up to and including hole GNDD-790. The Resource

For personal use only

estimate also used results from an earlier CEL RC drilling campaign, a CEL underground and surface channel sampling campaign and historic drill holes results that have been verified by CEL drilling and geological modelling. Halved drill core is sampled over intervals from 0.5 to 2.0 metres according to lithology and alteration contacts. Representative RC drill chips were sampled over standard 1 metre intervals. The average length of a sample in the mineralised domains is approximately 1.5 metres.

Not all drill holes intersected a mineralised domain and some drill holes were too far from nearby drill holes to allow confident interpretation between holes. Thirty one (31) separate mineralised domains were wireframed using drill hole data loaded in Micromine Origin software. Each domain was constrained by interpreted geological continuity with mineralisation > 0.2 g/t AuEq used a guide to limit the extent of the mineralisation in each domain.

Within each domain, estimation was made for Au Ag, Zn and Pb being the elements of economic interest. An estimate was also made for Fe and S. The S + Fe block estimate is used to estimate the density for blocks in the Mineral Resource Estimate via linear regression of measured sample densities (SG) with S + Fe assays in the interval from which the density was measured. A 2 metre composite length was selected for the estimation after reviewing the original sample lengths from the drilling.

A block model was set up in Surpac™ V6.6 software with a parent cell size of 10m (E) x 20m (N) x 10m (RL) with standard sub-celling to 2.5m (E) x 5.0m (N) x 2.5m (RL) to maintain the resolution of the mineralised domains. The 20m Y and vertical block dimensions were chosen to reflect drill hole spacing and to provide definition for potential mine planning. The shorter 10m X dimension was used to reflect the geometry and orientation of the majority of the domain wireframes. Variography was carried out using Leapfrog Edge software on the two metre composited data from each of the 31 domains for each variable.

All of the relevant variables; Au, Ag, Pb, Zn, Fe and S in each domain were estimated using Ordinary Kriging using only data from within that domain. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures. An oriented “ellipsoid” search for each domain was used to select data for interpolation.

A three pass estimation search was conducted, with expanding search ellipsoid dimensions and decreasing minimum number of samples with each successive pass. First passes were conducted with ellipsoid radii corresponding to 40% of the complete range of variogram structures for the variable being estimated. Pass 2 was conducted with 60% of the complete range of variogram structures for the variable being estimated. Pass 3 was conducted with dimensions corresponding to 200% of the semi-variogram model ranges. Blocks within the model where Au was not estimated during the first 3 passes were assigned as unclassified. The pass number was used a guide to categorising the Resource Estimate, with first pass estimates more likely to be classified at Indicated Resource and later passes as Inferred Resource.

Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model

For personal use only

grades for northings, eastings, and elevation. These checks show good correlation between estimated block grades and drill sample grades.

A Lerchs-Grossman pit optimisation routine using inputs as described above was used to determine that blocks > 0.30 g/t AuEq have reasonable prospects of future economic extraction by surface mining. Further models using similar input variable were used to identify a near surface optimised shell that was used to report the MRE at > 0.30 g/t AuEq block cut-off. Below the optimised shell, blocks > 1.0 g/t AuEq are considered to have reasonable prospects of future economic extraction by some type of underground technique.

TOP CUTS

Cube Consulting, a leading Perth based mining consulting firm, were retained to undertake an independent analysis of sample assay composite top cuts. A statistical analysis was undertaken on the sample composites with top cuts initially applied for Au, Ag, Zn and Pb composites on a domain-by-domain basis. In addition, the domains were then grouped by host rock and mineralisation style into three group domains:

1. Fault, limestone, and intrusion hosted high-grade skarn and endoskarn - Magnata and Sanchez Faults, Magnata, Sentazon, Muchilera, Main Norte Mantos, Verde endoskarn/skarn zones
2. Intrusion-hosted mineralisation – Verde, Pizzaro, and Gap Zones
3. Sediment hosted mineralisation – Magnata Zone, Verde Zone and extensions

Applying the Cube independent top cuts produced for the three host rock grouped domains produced an MRE similar to model using composites with no top cuts. This model with no top cuts applied is shown In Table 5. With no top cuts applied the model contains uncategorised 2.9 Moz AuEq (using a 0.3 g/t block cut-off inside the pit shell and 1.0 g/t AuEq under the pit shell). It should be noted that this alternative model is not a MRE but has been done to analyse the influence of the higher grade composites within the deposit.

Using the independent top-cuts provided by Cube risked allowing the higher grade composites within the deposit to overly influence the MRE. Accordingly, the Company undertook a re-analysis of the top cuts with lower top cuts re-applied for the three host-rock domains. The top-cut values were chosen by assessing the high-end distribution (tail) of the grade population within each group and selecting the uppermost outlier value above which the distribution became too heavily skewed.

Domain	Category	Mt	Au g/t	Ag g/t	Zn %	Pb %	AuEq g/t	AuEq (Mozs)
US\$1800 optimised shell > 0.30 ppm AuEq	Indicated	45.5	1.1	5.6	0.4	0.07	1.3	1.9

17 May 2021 - CEL Delivers Exceptional Metallurgical Test Work Results from the Hualilan Gold Project

About Challenger Exploration

Challenger Exploration Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America with an MRE of **2.8 million ounces of gold equivalent** recently announced for the Hualilan Gold Project in San Juan, Argentina in 2022.

The Company strategy is for the 100% owned Hualilan Gold Project to provide a high-grade low capex operation in the near term while it prepares for much larger bulk gold operations at both Hualilan and El Guaybo in Ecuador.

- Hualilan Gold Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive drilling with over 150 historical and almost 800 CEL drill-holes. The Company has released an Interim JORC 2012 Compliant resource of 2,133,065 ounces which remains open in most directions. This resource contains a Skarn component **6.3 Mt at 5.6 g/t AuEq for 1.1 Moz AuEq** and an intrusion/sediment-hosted component of **41.5Mt at 0.8 g/t AuEq for 1.0 Moz AuEq**. The resource was based on 126,000 metres of CEL's 264,000 metre drill program. The project was locked up in a dispute for the 15 years prior to the Company's involvement and as a consequence had seen no modern exploration until CEL acquired the project in 2019. In the past 2 years CEL has completed almost 800 drill holes for more than 200,000 metres of drilling. Results have included **6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 67.7m @ 7.3 g/t Au, 5.7 g/t Ag, 0.6% Zn, and 63.3m @ 8.5 g/t Au, 7.6 g/t Ag, 2.8% Zn**. This drilling intersected high-grade gold over 3.5 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including **209.0m at 1.0 g/t Au, 1.4 g/t Ag, 0.1% Zn and 110.5m at 2.5 g/t Au, 7.4 g/t Au, 0.90% Zn** in intrusives. CEL's current program which is fully funded will include an additional 60,000 metres of drilling, an updated JORC Compliant Mineral Resource Estimate, and Scoping Study followed by a PFS.
- El Guayabo Gold/Copper Project** covers 35 sq kms in southern Ecuador and is located 5 kilometres along strike from the 22-million ounce Cangrejos Gold Project¹. Prior to CEL the project was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including 156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t Ag which have never been followed up. CEL's maiden drilling program confirmed the discovery of a major Au-Cu-Ag-Mo gold system spanning several zones of significant scale. results from CEL's maiden drill program included **257.8m at 1.4 g/t AuEq** including **53.7m at 5.3 g/t AuEq** and **309.8m at 0.7 g/t AuEq** including **202.1m at 0.8 g/t AuEq**, and **528.7m at 0.5 g/t AuEq** from surface to the end of the hole including **397.1m at 0.6 g/t AuEq** from surface. The Company has drilled fifteen regionally significant Au-soil anomalies with over 500 metres of mineralisation intersected at seven of these fifteen anomalies, confirming the potential for a major bulk gold system at El Guayabo. The Company has two rigs on site completing an additional 25,000 metres of diamond core drilling designed to allow the reporting of a maiden JORC 2012 Compliant resource for the main GY-A discovery zone.

Mineral Resource Estimate - Hualilan Gold Project

Domain	Category	Mt	Au g/t	Ag g/t	Zn %	Pb %	AuEq g/t	AuEq (Mozs)
US\$1800 optimised shell > 0.30 ppm AuEq	Indicated	45.5	1.0	5.1	0.4	0.06	1.3	1.9
	Inferred	9.6	1.1	7.3	0.4	0.06	1.2	0.4
Below US\$1800 shell >1.0ppm AuEq	Inferred	5.5	2.1	10.7	1.0	0.06	2.6	0.5
	Total	60.6	1.1	6.0	0.4	0.06	1.4	2.8

Note: Some rounding errors may be present

Hualilan MRE, March 2023

¹ Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1900 Oz, Ag US\$24 Oz, Zn US\$4,000/t, Pb US\$2000/t
- Metallurgical recoveries are estimated to be Au (95%), Ag (91%), Zn (67%) Pb (58%) across all ore types (see **JORC Table 1 Section 3 Metallurgical assumptions**) based on metallurgical test work.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times 0.012106] + [Zn (\%) \times 0.46204] + [Pb (\%) \times 0.19961]$
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

COMPETENT PERSON STATEMENT – EXPLORATION RESULTS AND MINERAL RESOURCES

The information that relates to sampling techniques and data, exploration results, geological interpretation and Mineral Resource Estimate has been compiled Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results and Mineral Resources. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

The Mineral Resource Estimate for the Hualilan Gold Project was first announced to the ASX on 1 June 2022 and updated 29 March 2023. The Company confirms it is not aware of any information or assumptions that materially impacts the information included in that announcement and that the material assumptions and technical parameters underpinning the Mineral Resource Estimate continue to apply and have not materially changed.

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data -Hualilan Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> - <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> - <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> - <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> - <i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<p>Diamond core (HQ3 and NQ3) was cut longitudinally on site using a diamond saw or split using a hand operated hydraulic core sampling splitter. Samples lengths are generally from 0.5m to 2.0m in length (average 1.74m). Sample lengths are selected according to lithology, alteration, and mineralization contacts.</p> <p>For reverse circulation (RC) drilling, 2-4 kg sub-samples from each 1m drilled were collected from a face sample recovery cyclone mounted on the drill machine.</p> <p>Channel samples are cut into underground or surface outcrop using a hand-held diamond edged cutting tool. Parallel saw cuts 3-5cm apart are cut 2-4cm deep into the rock which allows for the extraction of a representative sample using a hammer and chisel. The sample is collected onto a plastic mat and collected into a sample bag.</p> <p>Core, RC and channel samples were crushed to approximately 85% passing 2mm. A 500g or a 1 kg sub-sample was taken and pulverized to 85% passing 75µm. A 50g charge was analysed for Au by fire assay with AA determination. Where the fire assay grade is > 10 g/t gold, a 50g charge was analysed for Au by Fire assay with gravimetric determination.</p> <p>A 10g charge was analysed for at least 48 elements by 4-acid digest and ICP-MS determination. Elements determined include Ag, As, Ba, Be, Bi, Ca, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr.</p> <p>For Ag > 100 g/t, Zn, Pb and Cu > 10,000 ppm and S > 10%, overlimit analysis was done by the same method using a different calibration.</p> <p>Unused pulps are returned from the laboratory to the Project and stored in a secure location, so they are available for any further analyses. Remaining drill core is stored undercover for future use if required.</p> <p>Visible gold observed has been observed in only 1 drill core sample only. Coarse gold is not likely to result in sample bias.</p> <p>Historic Data: There is little information provided by previous explorers to detail sampling techniques. Selected drill core was cut with a diamond saw longitudinally and one half submitted for assay. Assay was generally done for Au. In some drill campaigns, Ag and Zn were also analysed. There is limited multielement data available. No information is available for RC drill techniques and sampling.</p>

Criteria	JORC Code explanation	Commentary
----------	-----------------------	------------

Drilling techniques - *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*

CEL drilling of HQ3 core (triple tube) was done using various truck and track mounted drill machines that are operated by various drilling contractors based in Mendoza and San Juan. The core has not been oriented as the rock is commonly too broken to allow accurate core orientation.

CEL drilling of reverse circulation (RC) drill holes was done using a track-mounted LM650 universal drill rig set up for reverse circulation drilling. Drilling was done using a 5.25 inch hammer bit.

Collar details for DD drill holes and RC drill holes completed by CEL that are used in the resource estimate are shown below in WGS84, zone 19s projection. Collar locations for drill holes are surveyed using DGPS. Three DD holes and 3 RC holes have hand-held GPS collar surveys.

Historic Data:

Collar details for pre-CEL diamond core drilling (DD) and reverse circulation (RC) that is relied on for exploration and resource estimation is provided below. The data is archival, data cross checked with drill logs and available plans and sections where available. Collars shown below are in WGS84, zone 19s which is the standard projection used by CEL for the Project. Collar locations have been checked by CEL using differential GPS (DGPS) to verify if the site coincides with a marked collar, tagged drill site or likely drill pad location. In most cases the drill collars coincide with historic drill site, some of which (but not all) are tagged. The collar check surveys were reported in POSGAR (2007) projection and converted to WGS84.

Quality of assay data and laboratory tests - *The nature quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.*

The MSA laboratory used for sample preparation in San Juan was inspected by Stuart Munroe (Exploration Manager) and Sergio Rotondo (CEL Director) prior to any samples being submitted. The laboratory has been visited and reviewed most recently by Stuart Munroe (Exploration Manager) in May 2022. The laboratory procedures are consistent with international best practice and are suitable for samples from the Project. The SGS laboratory in San Juan and the ALS laboratory in Mendoza has not yet been inspected by CEL representatives due to COVID-19 restrictions. Each laboratory

- For geophysical tools spectrometers handheld XRF instruments etc the parameters used in determining the analysis including instrument make and model reading times calibrations factors applied and their derivation etc.
- Nature of quality control procedures adopted (eg standards blanks duplicates external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.

presents internal laboratory standards for each job to gauge precision and accuracy of assays reported.

CEL have used two different blank samples, submitted with drill core and subjected to the same preparation and assay as the core samples, RC sub-samples and channel samples. The blank samples are sourced from surface gravels in the Las Flores area of San Juan and from a commercial dolomite quarry near San Juan. In both cases the blank material is commonly for construction. Commonly, the blank samples are strategically placed in the sample sequence immediately after samples that were suspected of containing higher grade Au, Ag, S or base metals to test the lab preparation and contamination procedures. The values received from the blank samples suggest only rare cross contamination of samples during sample preparation.

For GNDD001 – GNDD010 samples analysed by MSA in 2019, three different Certified Standard Reference pulp samples (CRM) with known values for Au Ag Pb Cu and Zn were submitted with samples of drill core to test the precision and accuracy of the analytic procedures MSA laboratory in Canada. 26 reference analyses were analysed in the samples submitted in 2019. The standards demonstrate suitable precision and accuracy of the analytic process. No systematic bias

is observed.

For drill holes from GNDD011 plus unsampled intervals from the 2019 drilling, 17 different multi-element Certified Standard Reference pulp samples (CRM) with known values for Au Ag Fe S Pb Cu and Zn. 7 different CRM's with known values for Au only have been submitted with samples of drill core, RC chips and channel samples to test the precision and accuracy of the analytic procedures of the MSA,ALS and SGS laboratories used. In the results received to date there has been no systematic bias is observed. The standards demonstrate suitable precision and accuracy of the analytic process. A summary of the standard deviations from the expected values for CRM's used is summarised below. Generally, an average of standard deviations close to zero indicates a high degree of accuracy and a low range of standard deviations with a low fail count indicates a high degree of precision.

Verification of sampling and assaying

- The verification of significant intersections by either independent or alternative company personnel.
- The use of twinned holes.
- Documentation of primary data entry procedures data verification data storage (physical and electronic) protocols.
- Discuss any adjustment to assay data.

Final sample assay analyses are received by digital file in PDF and CSV format. There is no adjustment made to any of the assay values received. The original files are backed-up and the data copied into a cloud-based drill hole database, stored offsite from the project. The data is remotely accessible for geological modelling and resource estimation.

Assay results summarised in the context of this report have been rounded appropriately to 2 significant figures. No assay data have been otherwise adjusted. Replicate assay of 186 coarse reject samples from 2019 drilling has been done to verify assay precision. Original core samples were from the 2019 DD drilling which were analysed by MSA (San Juan preparation and Vancouver analysis). Coarse reject samples were analysed by ALS (Mendoza preparation and Vancouver analysis). The repeat analysis technique was identical to the original. The repeat analyses correlate very closely with the original analyses providing high confidence in precision of results between MSA and ALS. A summary of the results for the 186 sample pairs for key elements is provided below:

Element	Mean		Median		Std Deviation		Correlation coefficient
	MSA	ALS	MSA	ALS	MSA	ALS	
Au (FA and GFA ppm)	4.24	4.27	0.50	0.49	11.15	11.00	0.9972

CEL have sought to twin and triplicate some of the historic and recent drill holes to check the results of previous exploration. A preliminary analysis of the twin holes indicates similar widths and grades for key elements assayed. The twin holes are:
 GNDD003 – DDH34 and 04HD08
 GNRC110 – DDH53
 GNDD144 – GNDD021 – 05HD39
 GNRC107 – GNDD008/008A
 GNDD206 – DDH54
 GNDD421 – GNDD424

Location of data points	<ul style="list-style-type: none"> - Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys) trenches mine workings and other locations used in Mineral Resource estimation. - Specification of the grid system used. - Quality and adequacy of topographic control. 	<p>Following completion of drilling, collars are marked and surveyed using a differential GPS (DGPS) relative to a nearby Argentinian SGM survey point. The collars have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.</p> <p>Following completion of the channel sampling, the location of the channel samples is surveyed from a survey mark at the entrance to the underground workings, located using differential GPS. The locations have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.</p> <p>The drill machine is set-up on the drill pad using hand-held survey equipment according to the proposed hole design.</p> <p>Diamond core drill holes up to GNDD390 are surveyed down-hole at 30-40m intervals down hole using a down-hole compass and inclinometer tool. RC drill holes and diamond core holes from GNDD391 were continuously surveyed down hole using a gyroscope to avoid magnetic influence from the drill string and rocks. The gyroscope down-hole survey data is recorded in the drill hole database at 10m intervals.</p> <p>Ten diamond drill holes have no down hole survey data due to drill hole collapse or blockage of the hole due to loss of drilling equipment. These are GNDD036, 197, 212, 283, 376, 423, 425, 439, 445 and 465. For these holes, a survey of the collar has been used with no assumed deviation to the end of the hole.</p> <p>All current and previous drill collar sites, Minas corner pegs and strategic surface points have been surveyed using DGPS to provide topographic control for the Project. In addition, AWD3D DTM model with a nominal 2.5 metre precision has been</p>

Criteria	JORC Code explanation	Commentary
		acquired for the project and greater surrounding areas. Drone-based topographic survey data with 0.1 meter precision is being acquired over the project to provide more detail where required.
Data spacing and distribution	<ul style="list-style-type: none"> - <i>Data spacing for reporting of Exploration Results.</i> - <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> - <i>Whether sample compositing has been applied.</i> 	<p>Nominal 80m x 80m, 40m x 80m and 40m x 40m drill spacing is being applied to the drilling to define mineralised areas to Indicated Resource level of confidence, where appropriate. Drilling has been completed to check previous exploration, extend mineralisation along strike, and provide some information to establish controls on mineralization and exploration potential.</p> <p>Samples have not been composited.</p>
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> - <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known considering the deposit type.</i> - <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias this should be assessed and reported if material.</i> 	<p>As far as is currently understood and where practicable, the orientation of sampling achieves unbiased sampling of structures and geology controlling the mineralisation. Some exploration holes have drilled at a low angle to mineralisation and have been followed up with drill holes in the opposite direction to define mineralised domains.</p> <p>For underground channel sampling, the orientation of the sample is determined by the orientation of the workings. Where the sampling is parallel with the strike of the mineralisation, plans showing the location of the sampling relative to the orientation of the mineralisation, weighted average grades and estimates of true thickness are provided to provide a balanced report of the mineralisation that has been sampled.</p> <p>Drilling has been designed to provide an unbiased sample of the geology and mineralisation targeted. In exceptional circumstances, where drill access is restricted, drilling may be non-optimally angled across the mineralised zone.</p>
Sample security	<ul style="list-style-type: none"> - <i>The measures taken to ensure sample security.</i> 	Samples were under constant supervision by site security, senior technical personnel and courier contractors prior to delivery to the preparation laboratories in San Juan and Mendoza.
Audits or reviews	<ul style="list-style-type: none"> - <i>The results of any audits or reviews of sampling techniques and data.</i> 	There has not yet been any independent reviews of the sampling techniques and data.

Exploration Licence (Cateo) Held (Direct Award)

Name	Number	Transferred to CEL	Status	Area (ha)
-	1124-248G-20	Yes	Current	933.20
-	1124-188-G-20 (2 zones)	Yes	Current	327.16
-	1124.313-2021	Yes	Current	986.41
-	1124.564-G-2021	Yes	Current	1,521.12
-	1124.632-G-2022	Yes	Current	4,287.38

There are no known impediments to obtaining the exploration licenses or operating the Project.

Exploration done by other parties

- *Acknowledgment and appraisal of exploration by other parties.*

Intermittent historic sampling has produced a large volume of information and data including sampling, geological maps, reports, trenching data, underground surveys, drill hole results, geophysical surveys, non-JORC resource estimates plus property examinations and detailed studies by multiple geologists. Prior to exploration by CEL, no work has been completed on the Project since 2006.

There is at least 6 km of underground workings that pass through mineralised zones at Hualilan. Surveys of the workings are likely to be incomplete. Commonly incomplete records of the underground geology and sampling have been compiled and digitised as has sample data geological mapping adit exposures and drill hole results. Historic geophysical surveys exist but have been superseded by surveys completed by CEL.

Historic drilling on or near the Hualilan Project (Cerro Sur and Cerro Norte combined) extends to over 150 drill holes. The key historical exploration drilling and sampling programs are:

- 1984 – Lixivia SA channel sampling & 16 RC holes (AG1-AG16) totalling 2,040m
- 1995 - Plata Mining Limited (TSE: PMT) 33 RC holes (Hua- 1 to 33) + 1,500 RC chip samples
- 1998 – Chilean consulting firm EPROM (on behalf of Plata Mining) systematic underground mapping and channel sampling

Criteria	JORC Code explanation	Commentary																																				
		<ul style="list-style-type: none"> - 1999 – Compania Mineral El Colorado SA (“CMEC”) 59 diamond core holes (DDH-20 to 79) plus 1,700m RC program - 2003 – 2005 – La Mancha (TSE Listed) undertook 7,447m of DDH core drilling (HD-01 to HD-48) - Detailed resource estimation studies were undertaken by EPROM Ltd. (EPROM) in 1996 and CMEC (1999 revised 2000) both of which are well documented and La Mancha 2003 and 2006. <p>The collection of all exploration data by the various operators was of a high standard and appropriate sampling techniques intervals and custody procedures were used. Not all the historic data has been archived and so there are gaps in the availability of the historic data.</p>																																				
Geology	<ul style="list-style-type: none"> - <i>Deposit type geological setting and style of mineralisation.</i> 	<p>Mineralisation occurs in all rock types where it preferentially replaces limestone, shale and sandstone and occurs in fault zones and in fracture networks within dacitic intrusions.</p> <p>The mineralisation is Zn-(Pb-Cu-Ag) distal skarn (or manto-style skarn) overprinted with vein-hosted mesothermal to epithermal Au-Ag mineralisation. It has been divided into three phases – prograde skarn, retrograde skarn and a later quartz-rich mineralisation consistent with the evolution of a large hydrothermal system. Precise mineral paragenesis and hydrothermal evolution is the subject of on-going work which is being used for exploration and detailed geometallurgical test work.</p> <p>Gold occurs in native form as inclusions with sulphide (predominantly pyrite) and in pyroxene. The mineralisation commonly contains pyrite, chalcopyrite sphalerite and galena with rare arsenopyrite, pyrrhotite and magnetite.</p> <p>Mineralisation is either parallel to bedding in bedding-parallel faults, in veins or breccia matrix within fractured dacitic intrusions, at lithology contacts or in east-west striking steeply dipping siliceous faults that cross the bedding at a high angle. The faults have thicknesses of 1–4 metres and contain abundant sulphides. The intersection between the bedding-parallel mineralisation and east-striking cross veins seems to be important in localising the mineralisation.</p> <p>Complete oxidation of the surface rock due to weathering is thin. A partial oxidation / fracture oxidation layer near surface is 1 to 40m thick and has been modelled from drill hole intersections.</p>																																				
Drill hole Information	<ul style="list-style-type: none"> - <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> - <i>easting and northing of the drill hole collar</i> - <i>elevation or RL (Reduced Level – elevation above sea level in metres) of</i> 	<p>The following significant intersections have been reported by previous explorers. A cut-off grade of 1 g/t Au equivalent has been used with up to 2m of internal dilution or a cut-off grade of 0.2 g/t Au equivalent and up to 4m of internal dilution has been allowed. No metallurgical or recovery factors have been used in the intersections reported here. Drill collar location is provided in the previous section.</p> <table border="1"> <thead> <tr> <th>Hole_id</th> <th>From (m)</th> <th>Interval (m)</th> <th>Au (g/t)</th> <th>Ag (g/t)</th> <th>Zn (%)</th> </tr> </thead> <tbody> <tr> <td>AG16</td> <td>38.6</td> <td>1.2</td> <td>0.1</td> <td>28.6</td> <td>1.7</td> </tr> <tr> <td>MG10</td> <td>108.0</td> <td>3.0</td> <td>1.3</td> <td>No assay</td> <td>No assay</td> </tr> <tr> <td>DDH36</td> <td>24.7</td> <td>9.3</td> <td>1.6</td> <td>46.3</td> <td>1.2</td> </tr> <tr> <td>DDH53</td> <td>17.3</td> <td>1.4</td> <td>1.0</td> <td>1.7</td> <td>0.00</td> </tr> <tr> <td>DDH53</td> <td>24.0</td> <td>8.9</td> <td>3.7</td> <td>239.5</td> <td>0.03</td> </tr> </tbody> </table>	Hole_id	From (m)	Interval (m)	Au (g/t)	Ag (g/t)	Zn (%)	AG16	38.6	1.2	0.1	28.6	1.7	MG10	108.0	3.0	1.3	No assay	No assay	DDH36	24.7	9.3	1.6	46.3	1.2	DDH53	17.3	1.4	1.0	1.7	0.00	DDH53	24.0	8.9	3.7	239.5	0.03

CEL drill holes are numbered from GNDD001 the following significant assay results have been received since the 1 June 2022 Mineral Resource Estimate was reported. Significant results are, reported to a cut-off of 1.0 g/t AuEq (gold equivalent) unless otherwise indicated. Drill collar location is provided in the previous section.

Significant results for drill holes completed in 2022 since the 1 June 2022 MRE:

		(1)	cut off 10 g/t Au equivalent								
		(2)	cut off 0.2 g/t Au equivalent								
		NSI:	no significant intersection								
Data aggregation methods	<ul style="list-style-type: none"> - In reporting Exploration Results weighting averaging techniques maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of 	<p>Weighted average significant intercepts are reported to a gold grade equivalent (AuEq). Results are reported to cut-off grade of a 1.0 g/t Au equivalent and 10 g/t Au equivalent allowing for up to 2m of internal dilution between samples above the cut-off grade and 0.2 g/t Au equivalent allowing up to 10m of internal dilution between samples above the cut-off grade. The following metals and metal prices have been used to report gold grade equivalent (AuEq): Au US\$ 1780 / oz Ag US\$24 /oz and Zn US\$ 2800 /t.</p> <p>Metallurgical recoveries for Au, Ag and Zn have been estimated from the results of interim metallurgical test work completed by SGS Metallurgical Operations in Lakefield, Ontario using a combination of gravity and flotation of a combined metallurgical sample from 5 drill holes. Using data from the interim test results, and for the purposes of the AuEq calculation for drill hole significant intercepts, gold recovery is estimated at 89%, silver at 84% and zinc at 79%. Accordingly, the formula used is $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times (24/1780) \times (0.84/0.89)] + [Zn (g/t) \times (28.00 \times 31.1/1780) \times (0.79/0.89)]$. Metallurgical test work and geological and petrographic descriptions suggest all the elements included in the metal equivalents calculation have reasonable potential of eventual economic recovery. While Cu and Pb are reported in the</p>

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	<ul style="list-style-type: none"> - Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection and its use for Mineral Resource estimation purposes. - Data validation procedures used. 	<p>Geological logging completed by previous explorers was done on paper copies and transcribed into a series of excel spreadsheets. These data have been checked for errors. Checks have been made against the original logs and with follow-up twin and close spaced drilling. Only some of the historic drill holes have been used in the Resource Estimate, including the results presented in Section2. Some drill holes have been excluded where the geology indicates that the drill hole is likely mis-located or where the drill hole has been superseded by CEL drilling.</p> <p>For CEL drilled holes, assay data is received in digital format. Backup copies are backed up into a cloud-based file storage system and the data is entered into a drill hole database which is also securely backed up off site.</p> <p>The drill hole data is backed up and is updated periodically by the CEL GIS and data management team.</p>
Site visits	<ul style="list-style-type: none"> - Comment on any site visits undertaken by the Competent Person and the outcome of those visits. - If no site visits have been undertaken indicate why this is the case. 	<p>The Competent Person has undertaken site visits during exploration. Site visits were undertaken from 3 to 16 October 2019 15 to 30 November 2019 and 1-19 February 2020 before COVID-19 closed international travel. Post COVID site visits were undertaken from 21 November – 4 December 2021, 11 – 23 May 2022, 17-25 June, 3 – 14 September and 7 – 21 November2022. The performance of the drilling program, collection of data, sampling procedures, sample submission and exploration program were initiated and reviewed during these visits.</p>
Geological interpretation	<ul style="list-style-type: none"> - Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit. - Nature of the data used and of any assumptions made. - The effect if any of alternative interpretations on Mineral Resource estimation. - The use of geology in guiding and controlling Mineral Resource estimation. - The factors affecting continuity both of grade and geology. 	<p>The geological interpretation is considered appropriate given the drill core density of data that has been collected, access to mineralisation at surface and underground exposures. Given the data, geological studies past and completed by CEL, the Competent Person has a high level of confidence in the geological model that has been used to constrain the mineralised domains. It is assumed that networks of fractures controlled by local geological factors have focussed hydrothermal fluids and been the site of mineralisation in both the prograde zinc skarn and retrograde mesothermal – epithermal stages of hydrothermal evolution.</p> <p>The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the findings from the initial underground sampling activities. Mineralised domains have been built using explicit wireframe techniques from 0.2 – 0.5 g/t AuEq mineralised intersections, joined between holes by the instruction from the geology and structure. Continuity of grade between drill holes is determined by the intensity of fracturing, the host rock contacts (particularly dacite – limestone contacts) and by bedding parallel faults, particularly within limestone, at the limestone and overlying sedimentary rock contact and within the lower sequences of the sedimentary rocks within 40m of the contact.</p> <p>No alternative interpretations have been made from which a Mineral Resource Estimate has been made.</p>
Dimensions	<ul style="list-style-type: none"> - The extent and variability of the Mineral Resource expressed as length (along strike or otherwise) plan width and depth below surface to the upper and lower limits of the Mineral 	<p>31 separate domains were interpreted over a strike length of 2.3kms. The domains vary in width and orientation from 2m up to 100m in width. The deepest interpreted domain extends from the surface down approximately 600m below surface.</p>

Criteria	JORC Code explanation	Commentary																				
	<i>Resource.</i>																					
Estimation and modelling techniques	<ul style="list-style-type: none"> - <i>The nature and appropriateness of the estimation technique(s) applied and key assumptions including treatment of extreme grade values domaining interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i> - <i>The availability of check estimates previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i> - <i>The assumptions made regarding recovery of by-products.</i> - <i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i> - <i>In the case of block model interpolation the block size in relation to the average sample spacing and the search employed.</i> - <i>Any assumptions behind modelling of selective mining units.</i> - <i>Any assumptions about correlation between variables.</i> - <i>Description of how the geological interpretation was used to control the resource estimates.</i> - <i>Discussion of basis for using or not using grade cutting or capping.</i> - <i>The process of validation the checking process used the comparison of model data to drill hole data and use of reconciliation data if available</i> 	<p>Estimation was made for Au Ag, Zn and Pb being the elements of economic interest. Estimate was also made for Fe and S being the elements that for pyrite which is of economic and metallurgical interest and is also used to estimate the density for bocks in the Mineral Resource Estimate.</p> <p>No previous JORC Resource estimates or non-JORC Foreign Resource estimates were made with similar methods to compare to the current Resource estimate. No production records are available to provide comparisons.</p> <p>A 2m composite length was selected after reviewing the original sample lengths from the drilling which showed an average length of 1.54m for samples taken within the mineralised domains.</p> <p>A statistical analysis was undertaken on the sample composites top cuts for Au, Ag, Zn and Pb composites on a domain-by-domain basis. The domains were then grouped by host rock and mineralisation style and group domain top cuts were applied in order to reduce the influence of extreme values on the resource estimates without downgrading the high-grade composites too severely. The top-cut values were chosen by assessing the high-end distribution of the grade population within each group and selecting the value above which the distribution became erratic. The following table shows the top cuts applied to each group and domain for Au, Ag, Zn and Pb. No top cut was applied to estimation of Fe and S.</p> <table border="1"> <thead> <tr> <th>Group</th> <th>Au (ppm)</th> <th>Ag (ppm)</th> <th>Zn (%)</th> <th>Pb (%)</th> </tr> </thead> <tbody> <tr> <td>Fault Zone hosted (Magnata and Sanchez) and CAL (limestone) hosted</td> <td>80</td> <td>300</td> <td>20</td> <td>5</td> </tr> <tr> <td>LUT (siltstone) hosted</td> <td>20</td> <td>100</td> <td>5</td> <td>1</td> </tr> <tr> <td>DAC (intrusive) hosted</td> <td>15</td> <td>70</td> <td>5</td> <td>1.8</td> </tr> </tbody> </table> <p>Block modelling was undertaken in Surpac™ V6.6 software.</p> <p>A block model was set up with a parent cell size of 10m (E) x 20m (N) x 10m (RL) with standard sub-celling to 2.5m (E) x 5.0m (N) x 2.5m (RL) to maintain the resolution of the mineralised domains. The 20m Y and vertical block dimensions were chosen to reflect drill hole spacing and to provide definition for potential mine planning. The shorter 10m X dimension was used to reflect the geometry and orientation of the majority of the domain wireframes.</p> <p>Group Variography was carried out using Leapfrog Edge software on the two metre composited data from each of the 31 domains for each variable.</p>	Group	Au (ppm)	Ag (ppm)	Zn (%)	Pb (%)	Fault Zone hosted (Magnata and Sanchez) and CAL (limestone) hosted	80	300	20	5	LUT (siltstone) hosted	20	100	5	1	DAC (intrusive) hosted	15	70	5	1.8

Criteria	JORC Code explanation	Commentary
		<p>All relevant variables; Au, Ag, Pb, Zn, Fe and S in each domain were estimated using Ordinary Kriging using only data from within that domain. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures.</p> <p>An oriented “ellipsoid” search for each domain was used to select data for interpolation. A 3 pass estimation search was conducted, with expanding search ellipsoid dimensions and decreasing minimum number of samples with each successive pass. First passes were conducted with ellipsoid radii corresponding to 40% of the complete range of variogram structures for the variable being estimated. Pass 2 was conducted with 60% of the complete range of variogram structures for the variable being estimated. Pass 3 was conducted with dimensions corresponding to 200% of the semi-variogram model ranges. Blocks within the model where Au was not estimated during the first 3 passes were assigned as unclassified. Blocks for Ag, Pb, Zn, Fe and S that were not estimated were assigned the average values on a per-domain basis.</p> <p>Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades for northings, eastings and elevation. These checks show good correlation between estimated block grades and drill sample grades.</p>
Moisture	- Whether the tonnages are estimated on a dry basis or with natural moisture and the method of determination of the moisture content.	Tonnage is estimated on a dry basis.
Cut-off parameters	- The basis of the adopted cut-off grade(s) or quality parameters applied.	<p>The following metals and metal prices have been used to report gold grade equivalent (AuEq): Au US\$ 1900 / oz Ag US\$24 /oz, Zn US\$ 4,000 /t and Pb US 2,000/t.</p> <p>Average metallurgical recoveries for Au, Ag, Zn and Pb have been estimated from the results of Stage 1 metallurgical test work completed by SGS Metallurgical Operations in Lakefield, Ontario using a combination of gravity and flotation combined metallurgical samples as detailed in the Criteria below.</p> <p>For the AuEq calculation average metallurgical recovery is estimated as 94.9% for gold, 90.9% for silver, 67.0% for Zn and 57.8% for Pb.</p> <p>Accordingly, the formula used for Au Equivalent is: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times (24/1900) \times (0.909/0.949)] + [Zn (\%) \times (40.00 \times 31.1/1900) \times (0.670/0.949)] + [Pb (\%) \times 20.00 \times 31.1/1900) \times (0.578/.9490)]$.</p> <p>Based on the break-even grade for an optimised pit shell for gold equivalent, a AuEq cut-off grade of 0.25 ppm is used to report the resource within an optimised pit shell run at a gold price of US\$1,800 per ounce and allowing for Ag, Zn and Pb credits. Under this scenario, blocks with a grade above the 0.25 g/t Au Eq cut off are considered to have reasonable prospects of mining by open pit methods.</p> <p>A AuEq cut-off grade of 1.0 ppm was used to report the resource beneath the optimised pit shell run as these blocks are considered to have reasonable prospects of future mining by underground methods.</p>

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	<p>- Assumptions made regarding possible mining methods minimum mining dimensions and internal (or if applicable external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the mining assumptions made.</p>	<p>The Resource estimate has assumed that near surface mineralisation would be amenable to open pit mining given that the mineralisation is exposed at surface and under relatively thin unconsolidated cover. A surface mine optimiser has been used to determine the proportion of the Resource estimate model that would be amenable to eventual economic extraction by open pit mining methods. The surface mine optimiser was built using the following parameters with prices in USD:</p> <ul style="list-style-type: none"> - Au price of \$1,800 per oz, Ag price of \$23.4 per oz, Zn price of \$3,825 per tonne and Pb price of \$1,980 per tonne - Average metallurgical recoveries of 94.9% for Au, 90.9 % for Ag and 67 % for Zn and 57.8 % for Pb. - Ore and waste mining cost of \$2.00 per tonne - Unconsolidated cover removal cost of \$0.10 per tonne - Processing cost of \$10.00 per tonne - Transport and marketing of \$50 / oz of AuEq (road to Jan Juan then rail to Rosario Port) - Royalty of \$60 per oz Au, 3% for Ag, Zn and Pb. - Assumed concentrate payability of 94.1% for Au, 82.9% for Ag, 90 % for Zn and 95 % for Pb. - 45° pit slopes on the western side of the pit and 55° on the eastern side of the pit <p>Blocks above a 0.25 g/t AuEq within the optimised open pit shell are determined to have reasonable prospects of future economic extraction by open pit mining and are included in the Resource estimate on that basis. Blocks below the open pit shell that are above 1.0 g/t AuEq are determined to have reasonable prospects of future economic extraction by underground mining methods and are included in the Resource estimate on that basis.</p>
Metallurgical factors or assumptions	<p>- The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.</p>	<p>CEL has completed Stage 1 metallurgical test work on representative composite sample of mineralisation from:</p> <ol style="list-style-type: none"> 1. Two separate composite samples of limestone-hosted massive sulphide (manto) Sample A has a weighted average grade of 10.4 g/t Au, 31.7 g/t Ag, 3.2 % Zn and 0.46 % Pb. Sample B has a weighted average grade of 9.7 g/t Au, 41.6 g/t Ag, 4.0% Zn and 0.48% Pb. 2. One dacite (intrusive) composite sample with a weighted average grade of 1.1 g/t Au, 8.1 g/t Ag and 0.10 % Zn and 0.04% Pb. 3. One sediment hosted (fine grained sandstone and siltstone) composite sample with a weighted average grade of 0.68 g/t Au, 7.5 g/t Ag, 0.34 % Zn and 0.06 % Pb. 4. One oxidised limestone (manto oxide) composite sample with a weighted average grade of 7.0 g/t Au, 45 g/t Ag, 3.7% Zn and 0.77% Pb. <p>Gravity recovery and sequential flotation tests of the higher-grade limestone hosted mineralisation involved;</p> <ol style="list-style-type: none"> 1. primary P80 = 51 micron primary grind, 2. gravity recovery, 3. Pb-Cu followed by Zn rougher flotation,

alteration zones within the deposit.

- Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.

In fresh rock samples, a regression model for block density determination has been made by plotting assay interval Fe (%) + S (%) from the interval where the SG measurement was made against the SG measurement. Fe and S are the two elements that form pyrite which is the mineral that is commonly associated with gold and base metal mineralisation at Hualilan. SG plotted against (Fe+S) follows a linear trend within the mineralised domains for oxide and fresh rock as shown below.

For fresh rock at zero Fe + S (%) the density is assumed to be 2,530 kg/m³ (2.52 g/cc). The regression slope has a linear increase in density of 26.1 kg/m³ (0.0261 g/cc) for each 1 percent increase in Fe + S (%). The formula used for block density (kg/m³) determination in oxide rock is 2,530 + 26.1 x (Fe % + S%).

Criteria	JORC Code explanation	Commentary
Classification	<ul style="list-style-type: none"> - <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i> - <i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity and distribution of the data).</i> - <i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i> 	<p>The Mineral Resource has been classified based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters and an analysis of available density information.</p> <p>The estimation search strategy was undertaken in three separate passes with different search distances, and the minimum number of samples used to estimate a block which were then used as a guide for the classification of the resource into Indicated, Inferred and Unclassified. The classification was then further modified to restrict the Indicated Resource to the domains with closer spaced drilling.</p> <p>The potential open pit resource was constrained within an optimised pit shell run using a gold price of \$1,800 per ounce. Resources reported inside the pit shell were reported above a AuEq cut-off grade of 0.25 ppm and Resources outside the pit shell were reported above a AuEq cut-off grade of 1.0 ppm. Resource reported outside the pit shell above a 1.0 g/t AuEq cut-off is considered 100% Inferred.</p> <p>The Competent Person has reviewed the result and determined that these classifications are appropriate given the confidence in the geology, data and results from drilling.</p>
Audits or reviews	<ul style="list-style-type: none"> - <i>The results of any audits or reviews of Mineral Resource estimates.</i> 	<p>The Mineral Resource estimate has not been independently audited or reviewed.</p>
Discussion of relative accuracy/confidence	<ul style="list-style-type: none"> - <i>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</i> - <i>The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</i> - <i>These statements of relative accuracy and confidence of the estimate should be compared</i> 	<p>There is sufficient confidence in the data quality drilling methods and analytical results that they can be relied upon. The available geology and assay data correlate well. The approach and procedure is deemed appropriate given the confidence limits. The main factors which could affect relative accuracy are:</p> <ul style="list-style-type: none"> - domain boundary assumptions - orientation - grade continuity - top cut. <p>Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date and closer spaced drilling is required to improve the understanding of the grade continuity in both strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha are encouraging in terms of grade repeatability.</p> <p>The deposit contains very high grades and there is need for the use of top cuts.</p> <p>No production data is available for comparison.</p>
