

Latest results for Ecuador yield a 1.2 kilometre intersection

Highlights

- Next 6 holes on the GY-A anomaly drilled to allow the reporting of a Mineral Resource Estimate intersect significant mineralisation with results including (refer Table 1):
 - 1190.0m at 0.3 g/t AuEq² - 0.2 g/t Au, 1.3 g/t Ag, 0.1 % Cu, 12.6 ppm Mo from 4.0m including;
 - 511.1m at 0.4 g/t AuEq² - 0.3 g/t Au, 2.1 g/t Ag, 0.1 % Cu, 11.9 ppm Mo from 4.0m including;
 - 369.5m at 0.5 g/t AuEq² - 0.3 g/t Au, 2.2 g/t Ag, 0.1% Cu, 13.3 ppm Mo from 65.0m including;
 - 178.8m at 0.6 g/t AuEq² - 0.5 g/t Au, 2.4 g/t Ag, 0.1% Cu, 8.8 ppm Mo from 344.0m including;
 - 101.0 m at 0.8 g/t AuEq² - 0.6 g/t Au, 2.8 g/t Ag, 0.1% Cu, 5.9 ppm Mo (GYDD-22-025)
(GY-A Phase 2 drilling - hole mineralised from surface to end of hole)
 - 689.5m at 0.3 g/t AuEq² - 0.2 g/t Au, 1.4 g/t Ag, 0.1% Cu, 9.0 ppm Mo from surface including;
 - 317.7m at 0.5 g/t AuEq² - 0.4 g/t Au, 1.2 g/t Ag, 0.1% Cu, 15.0 ppm Mo from 75.4m including;
 - 54.0 m at 1.0 g/t AuEq² - 0.9 g/t Au, 1.7 g/t Ag, 0.1% Cu, 13.6 ppm Mo from 280.5m and
 - 22.5 m at 1.3 g/t AuEq² - 1.1 g/t Au, 1.7 g/t Ag, 0.1% Cu, 9.1 ppm Mo (GYDD-22-030)
(GY-A Phase 2 drilling - hole mineralised from surface to end of hole)
 - 871.9 m at 0.3 g/t AuEq² - 0.2 g/t Au, 1.3 g/t Ag, 0.04% Cu, 14.2 ppm Mo from surface including;
 - 275.3m at 0.4 g/t AuEq² - 0.3 g/t Au, 1.8 g/t Ag, 0.04% Cu, 8.2 ppm Mo from 92.6m including;
 - 67.9m at 0.6 g/t AuEq² - 0.5 g/t Au, 3.2 g/t Ag, 0.1% Cu, 7.7 ppm Mo (GYDD-22-027)
(GY-A Phase 2 drilling - hole mineralised from surface to end of hole)
- Results confirm the GY-A anomaly has significant scale, with mineralisation having a true width over 500 metres along its current 700 metres strike extent
- GY-A and GY-B anomaly converge into one large, mineralised zone with over one kilometre true thickness and mineralisation now defined from surface to 1100 metres depth
- Drilling intersected a new style of mineralisation with drillhole GYDD-22-026 encountering an epithermal vein, above the main mineralisation zone, with an intersection of 1.3m at 231.3 g/t Au

Commenting on the results, CEL Managing Director, Mr Kris Knauer, said:

"This set of results has produced our widest intersection to date with drill hole GYDD-22-025 intersecting 1.2 kilometres of mineralisation from near surface to the end of the hole.

All 14 regionally significant gold-soil anomalies drilled to date produced gold intercepts. Seven of these, now high-priority targets, appear capable of hosting a significant bulk gold resource. We are targeting the main two targets for a maiden Mineral Resource Estimate expected to be available in May."

² Reported as Gold Equivalent (AuEq) values – for requirements under the JORC Code see page 10

For personal use only

Challenger Exploration (ASX: CEL) ("CEL" the "Company") reports results from the next six holes in its Phase 2 drilling program in Ecuador. The holes are located on the GY-A anomaly, or the Main Discovery Zone, on the Company's 100% owned El Guayabo Gold-Copper Project in El Oro Province, Ecuador.

The Phase 2 drill program was designed to allow the reporting of a maiden Mineral Resource Estimate in accordance with the JORC 2012 Code for the Main Discovery Zone. All six holes intersected significant mineralisation from near surface with three of the six holes ending in mineralisation. The results confirm continuous mineralisation on the Main Discovery Zone over at least 700 metres of strike. This zone has the potential to host a bulk gold deposit of significant scale.

HIGHLIGHTS

The six holes contain several highlights with all holes intersecting more than 100 gram x metres of mineralisation from near surface with the majority of the holes ending in mineralisation. Highlights from the current round of Phase 2 drilling include:

- **GYDD-22-025: 1190.0m at 0.3 g/t AuEq including 369.5m at 0.6 g/t AuEq and 101.0m at 0.8 g/t AuEq** with the hole mineralised from surface to the end of the hole. This 1.2 kilometre intersection is the largest intersection to date at El Guayabo. Not only does the intersection confirm mineralisation over 1.1 kilometres vertically from surface, remaining open at depth, it confirms the GY-A and GY-B anomalies converge into one large zone of continuous mineralisation with a true width of over 1 kilometre.
- **GYDD-22-027 and GYDD-22-030:** Drilled on the same section 100 metres along strike from GYDD-22-025 in opposite directions both holes intersected mineralisation from surface to the end of the hole. Intersections of **871.8m at 0.3 g/t AuEq** (including **275.3m at 0.5 g/t AuEq**, including **67.9m at 0.6 g/t AuEq** (GYDD-22-027)) and **689.5m at 0.3 g/t AuEq** including **317.7m at 0.5 g/t AuEq** (GYDD-22-030) demonstrate a true width of over 1 kilometre in this zone where the GY-A and GY-B anomalies converge.
- **GYDD-22-028: 375.2m at 0.3 g/t AuEq including 194.2m at 0.5 g/t AuEq** extends the high-grade "Copper Breccia" on the Main Discovery Zone down-dip from historical drilling and confirms mineralisation is continuous over 250 metres of strike and remains open at depth.
- **GYDD-22-026: 950.6m at 0.3 g/t AuEq including 355.1m at 0.4 g/t AuEq** extends the mineralisation on the Main Discovery Zone 100 metres east along strike from the GYDD-21-001 discovery hole. Additionally, GYDD-22-026 intersected a new style of mineralisation with the hole intersecting **1.3m at 231.3 g/t Au** in an epithermal vein above the main zone of mineralisation.
- **GYDD-22-029: 382.2m at 0.3 g/t AuEq including 207.3m at 0.5 g/t AuEq** was an infill hole targeting the copper breccia on the Main Discovery Zone. It confirms mineralisation continuity over the current 250 metre strike extent of the copper breccia.

GYDD-22-025 - GY-A Anomaly, El Guayabo concession

GYDD-22-025 returned the widest intersection so far at the El Guayabo Copper-Gold Project intersecting 1.2 kilometres of mineralisation from near surface to the end of the hole.

The hole intersected **1190.0m at 0.3 g/t AuEq (0.2 g/t Au, 1.3 g/t Ag, 0.1% Cu, 12.65 ppm Mo)** from 4.0m including **511.1m at 0.4 g/t AuEq (0.3 g/t Au, 2.1 g/t Ag, 0.1 % Cu, 11.9 ppm Mo)** from 4.0m. This included a discrete higher-grade core of **369.5m at 0.5 g/t AuEq (0.3 g/t Au, 2.2 g/t Ag, 0.1 % Cu, 13.3 ppm Mo)** from 65.02m including **178.8m at 0.6 g/t AuEq (0.5 g/t Au, 2.4 g/t Ag, 0.1% Cu, 8.8 ppm Mo)** from 65.0m. This containing **101.0 m at 0.8 g/t AuEq (0.6 g/t Au, 2.8 g/t Ag, 0.1% Cu, 5.9 ppm Mo)** from 65.0m including **36.0 m at 0.9 g/t AuEq (0.8 g/t Au, 2.5 g/t Ag, 0.1% Cu, 5.1 ppm Mo)** from 65.0m.

As Figure 1 (Cross Section showing GYDD-22-025 and GY-A and GY-B anomalies) shows GYDD-22-025 extended the mineralisation intersected in the GYDD-21-001 discovery hole (784.3 metres at 0.4 g/t AuEq including 380.5 metres at 0.5 g/t AuEq from 16.2m) over 200 metres down dip. The hole also confirmed mineralisation extends from near surface 1100 metres and remains open at depth.

Additionally, the intersection in conjunction with GYDD-22-023 (drilled from the same drill pad in the opposite direction) confirms the Main Discovery Zone (GY-A) and the GY-B anomaly converge into one large zone of mineralisation with a true width of over 1 kilometre.

GYDD-22-027 and GYDD-22-030 - GY-A Anomaly, El Guayabo concession

GYDD-22-027 intersected **871.9 m at 0.3 g/t AuEq (0.2 g/t Au, 1.3 g/t Ag, 0.04% Cu, 14.2 ppm Mo)** from surface to the end of the hole including **275.3m at 0.4 g/t AuEq (0.3 g/t Au, 1.8 g/t Ag, 0.04% Cu, 8.2 ppm Mo)** from 92.6m. This included higher-grade zones of **13.4m at 0.8 g/t AuEq (0.6 g/t Au, 3.0 g/t Ag, 0.1% Cu, 31.8 ppm Mo)** and **67.9m at 0.6 g/t AuEq (0.5 g/t Au, 3.2 g/t Ag, 0.1% Cu, 7.7 ppm Mo)** and **15.8m at 0.6 g/t AuEq (0.5 g/t Au, 1.4 g/t Ag, 0.04% Cu, 2.6 ppm Mo)** and **7.9m at 0.9 g/t AuEq (0.8 g/t Au, 5.3 g/t Ag, 0.04% Cu, 2.8 ppm Mo)**.

GYDD-22-030 intersected **689.5m at 0.3 g/t AuEq (0.2 g/t Au, 1.4 g/t Ag, 0.1% Cu, 9.0 ppm Mo)** from surface to the end of the hole including **317.7m at 0.5 g/t AuEq (0.4 g/t Au, 1.2 g/t Ag, 0.1% Cu, 15.0 ppm Mo)** from 75.4m. These broad mineralisation zones contain several discrete higher-grade zones, including **6.0 m at 1.6 g/t AuEq (1.5 g/t Au, 1.7 g/t Ag, 0.05% Cu, 7.2 ppm Mo)** from 280.5m and **54.0 m at 1.0 g/t AuEq (0.9 g/t Au, 1.7 g/t Ag, 0.1% Cu, 13.6 ppm Mo)** from 280.5m and **22.5 m at 1.3 g/t AuEq (1.1 g/t Au, 1.7 g/t Ag, 0.1% Cu, 9.1 ppm Mo)** from 370.5m.

GYDD-22-027 and GYDD-22-030 were drilled on the same section in opposite directions (Figure 2). Both holes intersected mineralisation from surface to the end of the hole confirming GY-A and GY-B converge into one large zone of mineralisation at the eastern end of the discovery. The holes are located 100 metres west along strike from GYDD-22-025.

GYDD-22-028 and GYDD-22-029 - GY-A Anomaly, El Guayabo concession

GYDD-22-028 was drilled as a downdip test below historical drillholes GY-08 (280.0m at 0.6 g/t AuEq), GY-11 (239.0m at 0.8 g/t AuEq including 82.0m at 1.2 g/t AuEq), and GY-09 (164.6m at 0.6 g/t AuEq including 43.4m at 1.8 g/t AuEq) Figure 3.

GYDD-22-028 intersected **375.2 m at 0.4 g/t AuEq (0.2 g/t Au, 2.5 g/t Ag, 0.1% Cu, 1.6 ppm Mo)** from 4.5m including **194.3m at 0.5 g/t AuEq (0.2 g/t Au, 3.4 g/t Ag, 0.1% Cu, 1.3 ppm Mo)** from 172.3m. This included higher-grade zones of **18.8m at 0.7 g/t AuEq (0.7 g/t Au, 1.2 g/t Ag, 0.04 Cu, 4.6 ppm Mo)** from 4.5m and **48.6m at 1.0 g/t AuEq (0.5 g/t Au, 6.4 g/t Ag, 0.3% Cu, 1.1 ppm Mo)** from 318.0m. This deeper intersection correlates to the high-grade portion of the Copper Breccia, confirming the higher-grade mineralisation remains open at depth.

GYDD-22-029 was drilled as an infill hole 50 metres west of the historical drilling that intersected the copper breccia. The hole intersected **382.2m at 0.3 g/t AuEq (0.2 g/t Au, 2.7 g/t Ag, 0.1% Cu, 2.0 ppm Mo)** from near surface including **207.3m at 0.5 g/t AuEq (0.2 g/t Au, 3.8 g/t Ag, 0.1% Cu, 2.2 ppm Mo)**. This included higher-grade zones of **34.5m at 0.7 g/t AuEq (0.2 g/t Au, 8.3 g/t Ag, 0.2% Cu, 3.5 ppm Mo)** from 192.3m and **18.3 m at 1.0 g/t AuEq (0.6 g/t Au, 4.4 g/t Ag, 0.2% Cu, 1.6 ppm Mo)** from 342.2m. These higher-grade zones are typical of the high-grade Copper Breccia having elevated silver and copper values and confirm the continuity of the high-grade Copper Breccia over its current 250 metre strike extent.

GYDD-22-026 - GY-A Anomaly, El Guayabo concession

GYDD-22-026 was collared 100 metres east along strike from the GDDY-21-001 discovery hole and is the eastern limit of the drilling on the GY-A anomaly (or Main Discovery Zone) proper.

The hole intersected **950.6m at 0.3 g/t AuEq (0.1 g/t Au, 1.4 g/t Ag, 0.1% Cu, 14.7 ppm Mo)** from 94.5 including **355.1m at 0.4 g/t AuEq (0.2 g/t Au, 1.9 g/t Ag, 0.1% Cu, 24.3 ppm Mo)** from 208.5m. This included higher-grade zones of **30.5 m at 0.6 g/t AuEq (0.4 g/t Au, 5.3 g/t Ag, 0.1% Cu, 26.6 ppm Mo)** from 208.5m and **38.5 m at 0.6 g/t AuEq (0.4 g/t Au, 1.4 g/t Ag, 0.1% Cu, 32.4 ppm Mo)** from 360.0m.

In addition to the hole extending the Main Discovery Zone mineralisation 100 metres east along strike and confirming mineralisation remains open to the east, the hole intersected a new style of high-grade mineralisation near the top of the hole.

This intersection occurred in what is interpreted as an epithermal vein containing visible gold. The intersection was **1.3m at 231.5 g/t AuEq (231.3 g/t Au, 10.7 g/t Ag)** from 93.3m.

Next steps

One drill rig remains on site completing drill hole GYDD-23-041. Assays are pending from drillholes GYDD-23-031 to drillhole GYDD-23-040 as shown in Table 1 below. The Company anticipates receiving all outstanding assays from the current Phase 2 drill program by early May. This will allow the reporting of a maiden Mineral Resource Estimate in accordance with the JORC 2012 Code during May 2023.

Table 1 - Status of current Phase 2 drill program El Guayabo concession

Drillhole	Target	Depth (m)	Status
GYDD-23-031	GY-A	696.4	Complete assays pending
GYDD-23-032	GY-A	781.5	Complete assays pending
GYDD-23-033	GY-A	565.9	Complete assays pending
GYDD-23-034	GY-A	413.7	Complete assays pending
GYDD-23-035	GY-A	381.9	Complete assays pending
GYDD-23-036	GY-A	767.5	Complete assays pending
GYDD-23-037	GY-B	823.1	Complete assays pending
GYDD-23-038	GY-A	651.8	Complete assays pending
GYDD-23-039	GY-C	812.4	Complete assays pending
GYDD-23-040	GY-A	352.4	Complete assays pending
GYDD-23-041	GY-C	605.6	In progress planed depth 800m

Ends

Previous announcements referred to in this release include:

13 Jan 2022- First drill hole in Ecuador confirms the discovery of a major gold-copper system with a 748 metre Intersection

23 Feb 2022 - Ongoing drilling at the El Guayabo Project in Ecuador confirms the discovery of a major Au-Cu-Ag mineralised system

9 Mar 2022 - Significant high-grade intersection at Challenger's 100% owned El Guayabo gold-copper Project in Ecuador

22 April 2022 - Drilling confirms significant scale over multiple zones at CEL's 100% owned El Guayabo Au-Cu Project

6 June 2022 - Two New Copper Gold Discoveries at Colorado V Ecuador

4 July 2022 - Drilling Expands Colorado V Discoveries in Ecuador

5 October 2022 - Several 500 metre intersections continue to extend CEL's gold discoveries in Colorado V

18 January 2023 - Drilling success continues at the El Guayabo project

Table 2 - Significant Intersections reported this release

See below for information regarding AuEq's reported under the JORC Code.

² Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1780 Oz, Ag US\$22 Oz, Cu US\$9,650 /t, Mo US\$40,500 /t,
- Metallurgical recovery factors for gold, silver, copper, and molybdenum are assumed to be equal. No metallurgical factors have been applied in calculating the Au Eq.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times (22/1780)] + [Cu (\%) \times (9650/100 \times 31.1/1780)] + [Mo (\%) \times (40500/100 \times 31.1/1780)]$.
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have reasonable potential to be recovered and sold.

About Challenger Exploration

Challenger Exploration Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America with an MRE of **2.8 million ounces of gold equivalent** recently announced for the Hualilan Gold Project in San Juan, Argentina in 2022.

The Company strategy is for the 100% owned Hualilan Gold Project to provide a high-grade low capex operation in the near term while it prepares for much larger bulk gold operations at both Hualilan and El Guaybo in Ecuador.

1. **Hualilan Gold Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive drilling with over 150 historical and almost 800 CEL drill-holes. The Company has released an Interim JORC 2012 Compliant resource of 2,133,065 ounces which remains open in most directions. This resource contains a Skarn component **6.3 Mt at 5.6 g/t AuEq for 1.1 Moz AuEq** and an intrusion/sediment-hosted component of **41.5Mt at 0.8 g/t AuEq for 1.0 Moz AuEq**. The resource was based on 126,000 metres of CEL's 264,000 metre drill program. The project was locked up in a dispute for the 15 years prior to the Company's involvement and as a consequence had seen no modern exploration until CEL acquired the project in 2019. In the past 2 years CEL has completed almost 800 drill holes for more than 200,000 metres of drilling. Results have included **6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 67.7m @ 7.3 g/t Au, 5.7 g/t Ag, 0.6% Zn, and 63.3m @ 8.5 g/t Au, 7.6 g/t Ag, 2.8% Zn**. This drilling intersected high-grade gold over 3.5 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including **209.0m at 1.0 g/t Au, 1.4 g/t Ag, 0.1% Zn and 110.5m at 2.5 g/t Au, 7.4 g/t Ag, 0.90% Zn** in intrusives. CEL's current program which is fully funded will include an additional 60,000 metres of drilling, an updated JORC Compliant Mineral Resource Estimate, and Scoping Study followed by a PFS.
2. **El Guayabo Gold/Copper Project** covers 35 sq kms in southern Ecuador and is located 5 kilometres along strike from the 22-million ounce Cangrejos Gold Project¹. Prior to CEL the project was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including 156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t Ag which have never been followed up. CEL's maiden drilling program confirmed the discovery of a major Au-Cu-Ag-Mo gold system spanning several zones of significant scale. results from CEL's maiden drill program included **257.8m at 1.4 g/t AuEq including 53.7m at 5.3 g/t AuEq and 309.8m at 0.7 g/t AuEq including 202.1m at 0.8 g/t AuEq, and 528.7m at 0.5 g/t AuEq** from surface to the end of the hole including **397.1m at 0.6 g/t AuEq** from surface. The Company has drilled fifteen regionally significant Au-soil anomalies with over 500 metres of mineralisation intersected at seven of these fifteen anomalies, confirming the potential for a major bulk gold system at El Guayabo. The Company has two rigs on site completing an additional 25,000 metres of diamond core drilling designed to allow the reporting of a maiden JORC 2012 Compliant resource for the main GY-A discovery zone.

Hualilan MRE, March 2023

COMPETENT PERSON STATEMENT – EXPLORATION RESULTS AND MINERAL RESOURCES

The information that relates to sampling techniques and data, exploration results, geological interpretation and Mineral Resource Estimate has been compiled Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results and Mineral Resources. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

The Mineral Resource Estimate for the Hualilan Gold Project was first announced to the ASX on 1 June 2022 and updated 29 March 2023. The Company confirms it is not aware of any information or assumptions that materially impacts the information included in that announcement and that the material assumptions and technical parameters underpinning the Mineral Resource Estimate continue to apply and have not materially changed.

For personal use only

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data -El Guayabo Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> - <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> - <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> - <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> - <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<p>El Guayabo:</p> <p>CEL Drilling:</p> <ul style="list-style-type: none"> • CEL have drilled HQ diamond core which is sampled by cutting the core longitudinal into two halves. One half is retained for future reference and the other half is sent for sampling. • Sampling is done according to the geology. Sample lengths range from 0.5 to 2.5 metres. The average sample length is 1.5m. Samples are prepared at SGS Laboratories in Guayaquil for 30g fire assay and 4-acid digest ICPMS and then assayed in SGS Lima. • The sample size is considered representative for the geology and style of mineralisation intersected. All the core All collected material is sampled for assay. <p>Historic Drilling:</p> <ul style="list-style-type: none"> • Newmont Mining Corp (NYSE: NEM) ("Newmont") and Odin Mining and Exploration Ltd (TSX: ODN) ("Odin") core drilled the property between February 1995 and November 1996 across two drilling campaigns. • The sampling techniques were reviewed as part of a 43-101 Technical report on Cangrejos Property which also included the early results of the El Joven joint venture between Odin and Newmont, under which the work on the El Guayabo project was undertaken. This report is dated 27 May 2004 and found the sampling techniques and intervals to be appropriate with adequate QA/QC and custody procedures, core recoveries generally 100%, and appropriate duplicates and blanks use for determining assay precision and accuracy. • Duplicates were prepared by the Laboratory (Bonder Cleg) which used internal standards. Newmont also inserted its own standards at 25 sample intervals as a control on analytical quality • Diamond drilling produced core that was sawed in half with one half sent to the laboratory for assaying per industry standards and the remaining core retained on site. • Cu assays above 2% were not re-assayed using a technique calibrated to higher value Cu results hence the maximum reported assay for copper is 2%. • All core samples were analysed using a standard fire assay with atomic absorption finish on a 30 g charge (30 g FAA). Because of concerns about possible reproducibility problems in the gold values resulting from the presence of coarse gold, the coarse crusher rejects for all samples with results greater than 0.5 g/t were re-assayed using the "blaster" technique - a screen type fire analysis based on a pulverized sample with a mass of about 5 kg. Samples from most of these intersections were also analysed for Cu, Mo, Pb, Zn and Ag. • CEL has re-sampled sections of the Newmont and Odin drill core. ¼ drill core was cutover intervals that replicated the earlier sampling. Sample intervals ranged from 0.7 – 4.5m with an average of 2.0m. 533 samples

Criteria	JORC Code explanation	Commentary
		<p>totaling 1,094.29m were collected. Sampling was done for Au analysis by fire assay of a 30g charge and 43 element 4-acid digest with ICP_AES determination.</p> <ul style="list-style-type: none"> Field mapping (creek traverse) by CEL includes collection of rock chip samples for assay for Au by fire assay (50g) with AAS determination and gravimetric determination for values > 10 g/t Au and assay for 48 elements by 4-acid digest with ICP-MS determination. Rock chip samples are taken so as to be as representative as possible of the exposure being mapped. <p>Colorado V:</p> <ul style="list-style-type: none"> Soil sampling: A database of 4,495 soil analyses has been provided by Goldking Mining Company S.A. (GK) has been fully evaluated. No information has been provided on the method of sample collection or assay technique. The soil analyses include replicate samples and second split analyses. Pulps have been securely retained by Goldking Mining Company and have been made available to CEL for check assaying. Check assaying is planned, including collection of field duplicates. Rock chip sampling during regional mapping has been done on selected exposures. Sampling involves taking 2-3 kg of rock using a hammer from surface exposures that is representative of the exposure. Selected intervals of drill core have been cut longitudinally and half core were submitted for gold determination at GK's on-site laboratory prior to CEL's involvement with the Project. Re-sampling of the core by CEL involves taking ¼ core (where the core has previously been sampled) or ½ core (where the core has not previously been sampled). The core is cut longitudinally and sample intervals of 1 – 3 meters have been collected for analysis. ZK0-1 and ZK1-3 have been analysed for gold by fire assay (30g) with ICP determination and other elements by 4 acid digest with ICP-AES finish (36 elements) at SGS del Peru S.A.C. SAZK0-1, SAZK0-2, SAZK2-1, ZK0-2, ZK0-5, ZK1-5, ZK1-6, ZK2-1, ZK3-1, ZK3-4, ZK13-1 and ZK18-1 have been analysed for of gold by fire assay (30g) with ICP determination and other elements by 4 acid digest with combined ICP-AES and ICP-MS finish (50 elements) at SGS del Peru S.A.C. Samples from other holes have been analysed for gold by fire assay (30g) with ICP determination and overlimit (>10 g/t Au) by fire assay with gravimetric determination and other elements by 4-acid digest with ICP-MS (48 elements) at ALS Laboratories in Peru. Underground development has been mapped and channel sampled. Channel samples have been taken by cutting a horizontal channel of approximately 5 cm width and 4 cm depth into the walls at a nominal height of 1m above the ground. The channel cuts were made with an angle grinder mounted with a diamond blade. Samples were extracted from the channel with a hammer and chisel to obtain a representative sample with a similar weight per metre as would be obtained from a drill core sample. Analysis of the samples has been done by ALS Laboratories in Peru using the same preparation and analysis as has been used for drill core samples.
Drilling techniques	- <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple</i>	<p>El Guayabo:</p> <p>CEL Drilling:</p> <ul style="list-style-type: none"> Diamond core drilling collecting HQ core (standard tube). The core is not oriented.

Criteria	JORC Code explanation	Commentary
	<i>or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	<p>Historic Drilling:</p> <ul style="list-style-type: none"> Diamond core drilling HQ size from surface and reducing to NQ size as necessary. The historical records do not indicate if the core was oriented <p>Colorado V:</p> <ul style="list-style-type: none"> Diamond drilling was done using a rig owned by GK. Core size collected includes HQ, NQ and NQ3. There is no indication that oriented core was recovered.
Drill sample recovery	<ul style="list-style-type: none"> Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<p>El Guayabo:</p> <p>CEL Drilling:</p> <ul style="list-style-type: none"> Core run lengths recovered are recorded against the drillers depth markers to determine core recovery. Core sample recovery is high using standard HQ and NQ drilling No relationship between sample recovery and grade has been observed. <p>Historic Drilling:</p> <ul style="list-style-type: none"> In a majority of cases core recovery was 100%. In the historical drill logs where core recoveries were less than 100% the percentage core recovery was noted. No documentation on the methods to maximise sample recovery was reported in historical reports however inspection of the available core and historical drilling logs indicate that core recoveries were generally 100% with the exception of the top few metres of each drill hole. No material bias has presently been recognised in core. Observation of the core from various drill holes indicate that the rock is generally fairly solid even where it has been subjected to intense, pervasive hydrothermal alteration and core recoveries are generally 100%. Consequently, it is expected that the samples obtained were not unduly biased by significant core losses either during the drilling or cutting processes <p>Colorado V:</p> <ul style="list-style-type: none"> Core from Goldking has been re-boxed prior to sampling where boxes have deteriorated, otherwise the original boxes have been retained. Core lengths have been measured and compared to the depth tags that are kept in the boxes from the drilling and recovered lengths have been recorded with the logging. Where re-boxing of the core is required, core has been placed in the new boxes, row-by row with care taken to ensure all of the core has been transferred. No relationship has been observed between core recovery and sample assay values.

Criteria

JORC Code explanation

Commentary

- For Fe, of 56 CRM pulp analyses, 54 are within ± 2 SD (93%)
- 118 samples of pulp that are known to have a blank Au value have been included with the samples submitted. 16 samples returned Au values of >5 ppb (up to 11 ppb) indicating only mild instrument calibration or contamination during fire assay.
- 137 $\frac{1}{4}$ core duplicate samples have been submitted. The duplicate analyses for Au, Ag, Cu, Pb, Zn, As and Mo have been analysed. The duplicate sample analyses follow very closely the original analyses providing assurance that the sample size and technique is appropriate.

Criteria	JORC Code explanation	Commentary
		<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used by Newmont and Odin are still in line with industry best practice with appropriate QA/QC and chain of custody and are considered appropriate. Available historical data does not mention details of geophysical tools as such it is believed a geophysical campaign was not completed in parallel with the drilling campaign. Duplicates were prepared by the Laboratory (Bonder Cleg) which used internal standards. Newmont also inserted its own standards at 25 sample intervals as a control on analytical quality. Later Odin undertook a re-assaying program of the majority of the higher-grade sections which confirmed the repeatability. Given the above, it is considered acceptable levels of accuracy and precision have been established CEL ¼ and ½ core samples were prepared for assay at SGS Del Ecuador S.A.in Quito, Ecuador with analysis completed by in Lima at SGS del in Peru S.A.C and by ALS Laboratories in Quito with analysis completed by ALS in Vancouver, Canada. Samples were crushed and a 500g sub-sample was pulverized to 85% passing 75 µm. The technique provides for a near total analysis of the economic elements of interest. CEL rock chip samples were prepared for assay at ALS Laboratories (Quito) with analysis being completed at ALS Laboratories (Peru). The fire assay and 4-acid digest provide for near-total analysis of the economic elements of interest. No standards or blanks were submitted with the rock chip samples. <p>Colorado V:</p> <ul style="list-style-type: none"> No information is available on the methods used to analyse the historic soil or drill core samples. Assay results are not provided in this report. Soil samples have been analysed by GK for Au, Cu, Ag, Zn, Pb, As, Mn, Ni, Cr, Mo, Sn, V, Ti, Co, B, Ba, Sb, Bi and Hg. Pulps have been securely retained and check assaying is planned. Drill core was partially assayed for gold only with assays undertaken by Goldking's on site laboratory CEL samples of drill core re-sampled by CEL. Blanks and CRM (standards) were added to the batches to check sample preparation and analysis. 3 separate CRM's were included in the batches sent for analysis. All three have certified Au values. The results of the analysis of the CRM is shown below. With a few exceptions, the CRM has returned results within +/- 2 SD of the certified reference value. There is no bias in the results returned from either SGS or ALS laboratories. CRM3 analyses by fire assay at SGS did not include overlimit (>10 g/t).

Criteria

JORC Code explanation

Commentary

- No duplicate samples have been submitted.
- Two different blanks have been included randomly within the sample batches. A CRM blank with a value of <0.01 ppm (10 ppb) Au was used initially. More recent batches have used a blank gravel material which has no certified reference value. The results are shown below. The first 4 gravel blanks show elevated Au values which is believed to be due to contamination of the blank prior to submission and not due to laboratory contamination. With one exception, the blanks have returned values below 10 ppb.

Verification of sampling and assaying

- The verification of significant intersections by either independent or alternative company personnel.
- The use of twinned holes.

**El Guayabo:
CEL Drilling:**

- Samples from significant intersections have not been checked by a second laboratory. No holes have been twinned.

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> - Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> - The El Guayabo (Code. 225) mining concession is located within El Oro Province. The concession is held by Torata Mining Resources S.A (TMR S.A) and was granted in compliance with the Mining Act ("MA") in on April 27, 2010. There are no overriding royalties on the project other than normal Ecuadorian government royalties. - The property has no historical sites, wilderness or national park issues. - The mining title grants the owner an exclusive right to perform mining activities, including, exploration, exploitation and processing of minerals over the area covered by the prior title for a period of 25 years, renewable for a further 25 years. Under its option agreement, the owner has been granted a negative pledge (which is broadly equivalent to a fixed and floating charge) over the concession. In addition, a duly notarized Irrevocable Promise to Transfer executed by TMR S.A in favor of AEP has been lodged with the Ecuador Mines Department. - The Colorado V mining concession (Code No. 3363.1) located in Bellamaria, Santa Rosa, El Oro, Ecuador was granted in compliance with the Mining Act ("MA") in on July 17, 2001. It is adjacent to El Guayabo concession to the north. The concession is held by Goldking Mining Company S.A. There are no overriding royalties on the project other than normal Ecuadorian government royalties. - The concession has no historical sites, wilderness or national park issues. - The El Guayabo 2 (Code. 300964) mining concession is located Torata parish, Santa Rosa canton, El Oro province, Ecuador. The concession is held by T Mr. Segundo Ángel Marín Gómez and Mrs. Hermida Adelina Freire Jaramillo and was granted in compliance with the Mining Act ("MA") on 29April 29, 2010. There are no overriding royalties on the project other than normal Ecuadorian government royalties. - The property has no historical sites, wilderness, or national park issues.
Exploration done by other parties	<ul style="list-style-type: none"> - Acknowledgment and appraisal of exploration by other parties. 	<p>El Guayabo:</p> <ul style="list-style-type: none"> - Previous exploration on the project has been undertaken by Newmont and Odin from 1994 to 1997. This included surface pit and rock chip geochemistry, followed by the drilling of 33 drill holes for a total of 7605.52 meters) to evaluate the larger geochemical anomalies. - The collection of all exploration data by Newmont and Odin was of a high standard and had appropriate sampling techniques and intervals, adequate QA/QC and custody procedures, and appropriate duplicates and blanks used for determining assay precision and accuracy. - The geological interpretation of this data, including core logging and follow up geology was designed and directed by in-country inexperienced geologists. It appears to have been focused almost exclusively for gold targeting surface gold anomalies or the depth extensions of higher-grade gold zones being exploited by the artisanal miners. The geologic logs for all drill holes did not record details that would have been typical, industry standards for porphyry copper

Criteria	JORC Code explanation	Commentary																																																																																																																																																																
		<p>exploration at that time. Several holes which ended in economic mineralisation have never been followed up.</p> <ul style="list-style-type: none">- In short, important details which would have allowed the type of target to be better explored were missed which in turn presents an opportunity to the current owner. <p>Colorado V:</p> <ul style="list-style-type: none">- All exploration known has been completed by GK. Drilling has been done from 2016 to 2019. 56 drill holes, totaling 21,471.83m have been completed by GK. <p>El Guayabo 2:</p> <ul style="list-style-type: none">- Exploration work undertaken by the previous owner was limited to field mapping and sampling including assaying of a small number of samples for gold, silver, copper, lead and zinc. The report is only available in Spanish and assays were conducted in a local laboratory in Ecuador with the majority of this work undertaken in 2017.																																																																																																																																																																
Geology	<ul style="list-style-type: none">- <i>Deposit type, geological setting and style of mineralisation.</i>	<ul style="list-style-type: none">- It is believed that the El Guayabo, El Guayabo 2, and Colorado V concessions contain a “Low Sulfide” porphyry gold copper system and intrusive-related gold. The host rocks for the intrusive complex is metamorphic basement and Oligocene – Mid-Miocene volcanic rocks. This suggests the intrusions are of a similar age to the host volcanic sequence, which also suggests an evolving basement magmatic system. Intrusions are described in the core logs as quartz diorite and dacite. Mineralisation has been recognized in:<ul style="list-style-type: none">– Steeply plunging breccia bodies and in the metamorphic host rock adjacent to the breccia (up to 200 m in diameter)– Quartz veins and veinlets– Disseminated pyrite and pyrrhotite in the intrusions and in the metamorphic host rock near the intrusions.																																																																																																																																																																
Drill hole Information	<ul style="list-style-type: none">- <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i><ul style="list-style-type: none">o <i>easting and northing of the drill hole collar</i>o <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i>o <i>dip and azimuth of the hole</i>o <i>down hole length and interception depth</i>o <i>hole length.</i>- <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	<p>El Guayabo Historic drill hole information is provided below.</p> <table><tr><th>DRILLHOLE CODE</th><th>EAST (X)</th><th>NORTH (N)</th><th>ELEVATION (m.a.s.l)</th><th>AZIMUTH (°)</th><th>DIP (°)</th><th>FINAL DEPTH</th><th>DRILLED BY</th></tr><tr><td>DDHGY 01</td><td>628928.09</td><td>9605517.20</td><td>839.01</td><td>360</td><td>-90.0</td><td>249.20</td><td>Odin</td></tr><tr><td>DDHGY 02</td><td>629171.15</td><td>9606025.55</td><td>983.16</td><td>360.0</td><td>-90.0</td><td>272.90</td><td>Odin</td></tr><tr><td>DDHGY 03</td><td>629041.84</td><td>9606312.81</td><td>1063.37</td><td>305.0</td><td>-60.0</td><td>295.94</td><td>Odin</td></tr><tr><td>DDHGY 04</td><td>629171.68</td><td>9606025.18</td><td>983.2</td><td>125.0</td><td>-60.0</td><td>172.21</td><td>Odin</td></tr><tr><td>DDHGY 05</td><td>628509.21</td><td>9606405.29</td><td>989.87</td><td>145.0</td><td>-60.0</td><td>258.27</td><td>Odin</td></tr><tr><td>DDHGY 06</td><td>629170.56</td><td>9606025.97</td><td>983.11</td><td>305.0</td><td>-60.0</td><td>101.94</td><td>Odin</td></tr><tr><td>DDHGY 07</td><td>629170.81</td><td>9606025.80</td><td>983.16</td><td>305.0</td><td>-75.0</td><td>127.00</td><td>Odin</td></tr><tr><td>DDHGY 08</td><td>628508.95</td><td>9606405.74</td><td>989.86</td><td>145.0</td><td>-75.0</td><td>312.32</td><td>Odin</td></tr><tr><td>DDHGY 09</td><td>629171.22</td><td>9606025.88</td><td>983.22</td><td>45.0</td><td>-75.0</td><td>166.25</td><td>Odin</td></tr><tr><td>DDHGY 10</td><td>629170.77</td><td>9606025.24</td><td>983.12</td><td>225.0</td><td>-75.0</td><td>194.47</td><td>Odin</td></tr><tr><td>DDHGY 11</td><td>628507.97</td><td>9606405.33</td><td>989.83</td><td>160.0</td><td>-60.0</td><td>241.57</td><td>Odin</td></tr><tr><td>DDHGY 12</td><td>629087.18</td><td>9606035.53</td><td>996.98</td><td>125.0</td><td>-60.0</td><td>255.7</td><td>Odin</td></tr><tr><td>DDHGY 13</td><td>629242.46</td><td>9605975.42</td><td>997.292</td><td>320.0</td><td>-65.0</td><td>340.86</td><td>Odin</td></tr><tr><td>DDHGY 14</td><td>629242.27</td><td>9605975.64</td><td>997.285</td><td>320.0</td><td>-75.0</td><td>309.14</td><td>Odin</td></tr><tr><td>DDHGY 15</td><td>629194.67</td><td>9605912.35</td><td>977.001</td><td>320.0</td><td>-60.0</td><td>251.07</td><td>Odin</td></tr><tr><td>DDHGY 16</td><td>629285.92</td><td>9606044.44</td><td>1036.920</td><td>320.0</td><td>-60.0</td><td>195.73</td><td>Odin</td></tr><tr><td>DDHGY 17</td><td>629122.31</td><td>9606058.64</td><td>1021.053</td><td>125.0</td><td>-82.0</td><td>280.04</td><td>Odin</td></tr><tr><td>DDHGY 18</td><td>628993.10</td><td>9606035.45</td><td>977.215</td><td>140.0</td><td>-60.0</td><td>160.35</td><td>Odin</td></tr><tr><td>DDHGY 19</td><td>629087.23</td><td>9606034.98</td><td>997.332</td><td>45.0</td><td>-53.0</td><td>175.41</td><td>Odin</td></tr></table>	DRILLHOLE CODE	EAST (X)	NORTH (N)	ELEVATION (m.a.s.l)	AZIMUTH (°)	DIP (°)	FINAL DEPTH	DRILLED BY	DDHGY 01	628928.09	9605517.20	839.01	360	-90.0	249.20	Odin	DDHGY 02	629171.15	9606025.55	983.16	360.0	-90.0	272.90	Odin	DDHGY 03	629041.84	9606312.81	1063.37	305.0	-60.0	295.94	Odin	DDHGY 04	629171.68	9606025.18	983.2	125.0	-60.0	172.21	Odin	DDHGY 05	628509.21	9606405.29	989.87	145.0	-60.0	258.27	Odin	DDHGY 06	629170.56	9606025.97	983.11	305.0	-60.0	101.94	Odin	DDHGY 07	629170.81	9606025.80	983.16	305.0	-75.0	127.00	Odin	DDHGY 08	628508.95	9606405.74	989.86	145.0	-75.0	312.32	Odin	DDHGY 09	629171.22	9606025.88	983.22	45.0	-75.0	166.25	Odin	DDHGY 10	629170.77	9606025.24	983.12	225.0	-75.0	194.47	Odin	DDHGY 11	628507.97	9606405.33	989.83	160.0	-60.0	241.57	Odin	DDHGY 12	629087.18	9606035.53	996.98	125.0	-60.0	255.7	Odin	DDHGY 13	629242.46	9605975.42	997.292	320.0	-65.0	340.86	Odin	DDHGY 14	629242.27	9605975.64	997.285	320.0	-75.0	309.14	Odin	DDHGY 15	629194.67	9605912.35	977.001	320.0	-60.0	251.07	Odin	DDHGY 16	629285.92	9606044.44	1036.920	320.0	-60.0	195.73	Odin	DDHGY 17	629122.31	9606058.64	1021.053	125.0	-82.0	280.04	Odin	DDHGY 18	628993.10	9606035.45	977.215	140.0	-60.0	160.35	Odin	DDHGY 19	629087.23	9606034.98	997.332	45.0	-53.0	175.41	Odin

Data aggregation methods	<ul style="list-style-type: none"> - In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> • No grade cutting has been used to derive the weighted average grades reported. • Minimum cut of grade of 0.2 g/t Au Equivalent (AuEq) was used for determining intercepts. • Aggregate intercepts have been reported with higher grade inclusions to demonstrate the impact of aggregation. A bottom cut of 0.5 g/t Au Equivalent has been used to determine the higher-grade inclusions. Given the generally consistent nature of the mineralisation the impact of the aggregation of high-grade results and longer lengths of low-grade results does not have a large impact. For example, in the intercept of 156m @ 2.6 g.t Au in hole GGY-02: <ul style="list-style-type: none"> • over half of the intercept comprises gold grades in excess of 1 g/t Au • only 20% of the intercept includes grades between 0.2 and 0.5 g/t Au • over one third includes gold grades in excess of 2 g/t Au. • Au Eq assumes a gold price of USD 1,780/oz, a silver price of USD 22 /oz, a copper price of USD 9,650 /t, and a Molybdenum price of US\$40,500 • Metallurgical recovery factors for gold, silver, copper, and Molybdenum are assumed to be equal. No metallurgical factors have been applied in calculating the AuEq at this early stage of the Project, hence the formula for calculating the Au Eq is: $Au (g/t) + (Ag (g/t) \times 22/1780) + (1.68604 \times Cu (\%) + (7.07612 \times Mo (\%)))$. • CEL confirms that it is the company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold <p>Significant historic intersections from El Guayabo drilling are shown below:</p>

Colorado V:

A cut-off grade of 0.1 g/t Au was used to report the assays of re-samples core and channel samples from underground development with up to 10 metres of internal dilution below cut-off allowable for the reporting of significant intercepts, consistent with a large low-grade mineralized system. Intersections that use a different cut-off are indicated.

Guayabo and Colorado V Camp 1, Phase #1 Drilling Intercepts: A cut-off grade of 0.1 g/t Au was used to report the assays of core samples with up to 10 metres of internal dilution below cut-off allowable for the reporting of significant intercepts, consistent with a large low-grade mineralized system. Intersections that use a different cut-off are indicated (e.g. 0.2g/t Au Eq, 0.5g/t AuEq, 1.0g/t AuEq, 10.0g/t AuEq).												
Relationship between mineralisation widths and intercept lengths	- These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. - If it is not known and only the down hole lengths are reported,	- The geometry of the breccia hosted mineralisation appears to be predominantly vertical pipes while the geometry of the intrusive hosted mineralisation is sub-vertical.. - The preliminary interpretation is that the breccia hosted mineralisation occurs in near vertical breccia pipes. Thus, intersections in steeply inclined holes may not be representative of the true width of this breccia hosted mineralisation. The relationship between the drilling orientation and some of the key mineralised structures and possible reporting bias in terms of true width is illustrated in the figure below.

Criteria

JORC Code explanation

Commentary

there should be a clear statement to this effect (eg 'down hole length, true width not known').

Diagrams

- Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.

See section above and sections accompanying this release

Balanced reporting

- Where comprehensive reporting of all Exploration Results is not practicable,

- The reporting is fair and representative of what is currently understood to be the geology and controls on mineralisation at the project.

Criteria	JORC Code explanation	Commentary
	<i>representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	
Other substantive exploration data	<p>- Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</p>	<p>El Guayabo:</p> <p>Quantec Geophysical services conducted a SPARTAN Broadband Magnetotelluric and TITAN IP/EMAP surveys completed February 3rd to April 1st, 2019 over the El Guayabo property by Quantec Geoscience Ltd. on behalf of AAR Resources. The survey covered 16 square kilometers with data collected on 300m 3D spacing on a grid oriented at 10 degrees and 100 degrees. The grid was moved 10 degrees so the survey could be oriented perpendicular to the main geological structures. The survey involved a total of 205 Magnetotelluric (MT) sites and 2 test TITAN IP/EMAP profiles were surveyed. The final survey results to which will be delivered will consist of :</p> <ul style="list-style-type: none"> • Inversion 2D products <ul style="list-style-type: none"> • 2D model sections (for each line) of the: • DC resistivity model; • IP chargeability model using the DC resistivity model as a reference; • IP chargeability model using a half-space resistivity model as a reference; • MT(EMAP) resistivity model; • Joint MT+DC resistivity model; IP chargeability model using the MT+DC resistivity model; • Inversion 3D products <ul style="list-style-type: none"> • 3D MT model; • Cross-sections and Elevation Plan maps of the 3D MT models; <p>Figures showing Survey Locations and Results are included in the body of this release</p> <p>DCIP INVERSION PROCEDURES</p> <p>DCIP is an electrical method that uses the injection of current and the measurement of voltage difference along with its rate of decay to determine subsurface resistivity and chargeability respectively. Depth of investigation is mainly controlled by the array geometry but may also be limited by the received signal (dependent on transmitted current) and ground resistivity. Chargeability is particularly susceptible to data with a low signal-to-noise ratio. The differences in penetration depth between DC resistivity and chargeability are a function of relative property contrasts and relative signal-to-noise levels between the two measurements. A detailed introduction to DCIP is given in Telford, et al. (1976). The primary tool for evaluating data is through the inversion of the data in two or three dimensions. An inversion model depends not only on the data collected, but also on the associated data errors in the reading and the “model norm”. Inversion models are not unique and may contain “artefacts” from the inversion process. The inversion model may not accurately reflect all the information apparent in the actual data. Inversion models must be reviewed in context with the observed data, model fit, and with an understanding of the model norm used.</p>

Criteria	JORC Code explanation	Commentary
		<p>The DC and IP inversions use the same mesh. The horizontal mesh is set as 2 cells between electrodes. The vertical mesh is designed with a cell thickness starting from 20 m for the first hundred metres to accommodate the topographic variation along the profiles, and then increases logarithmically with depth. The inversions were generally run for a maximum of 50 iterations. The DC data is inverted using an unconstrained 2D inversion with a homogenous half-space of average input data as starting model. For IP inversions, the apparent chargeability ρ_a is computed by carrying out two DC resistivity forward models with conductivity distributions $\sigma(x_i, z_j)$ and $(1-\eta)\sigma(x_i, z_j)$ (Oldenburg and Li, 1994), where (x_i, z_j) specifies the location in a 2D mesh. The conductivity distributions used in IP inversions can be the inverted DC model or a half space of uniform conductivity. Two IP inversions are then calculated from the same data set and parameters using different reference models. The first inversion of the IP data uses the previously calculated DC model as the reference model and is labelled the IP dceref model. The second IP inversion uses a homogeneous half-space resistivity model as the reference model and is labelled IP hsfref model. This model is included to test the validity of chargeability anomalies, and to limit the possibility of inversion artefacts in the IP model due to the use of the DC model as a reference. The results of this second IP inversion are presented on the digital archived attached to this report.</p> <p>MAGNETOTELLURIC INVERSIONS</p> <p>The Magnetotelluric (MT) method is a natural source EM method that measures the variation of both the electric (E) and magnetic (H) field on the surface of the earth to determine the distribution at depth of the resistivity of the underlying rocks. A complete review of the method is presented in Vozoff (1972) and Orange (1989).</p> <p>The measured MT impedance Z, defined by the ratio between the E and H fields, is a tensor of complex numbers. This tensor is generally represented by an apparent resistivity (a parameter proportional to the modulus of Z) and a phase (argument of Z). The variation of those parameters with frequency relates the variations of the resistivity with depth, the high frequencies sampling the sub-surface and the low frequencies the deeper part of the earth. However, the apparent resistivity and the phase have an opposite behaviour. An increase of the phase indicates a more conductive zone than the host rocks and is associated with a decrease in apparent resistivity. The objective of the inversion of MT data is to compute a distribution of the resistivity of the surface that explains the variations of the MT parameters, i.e. the response of the model that fits the observed data. The solution however is not unique and different inversions must be performed (different programs, different conditions) to test and compare solutions for artefacts versus a target anomaly.</p> <p>An additional parameter acquired during MT survey is the Tipper. Tipper parameters Tzx and Tzy (complex numbers) represent the transfer function between the vertical magnetic field and the horizontal X (Tzx), and Y (Tzy) magnetic fields respectively (as the impedance Z represent the transfer function between the electric and magnetic fields). This tipper is a 'local' effect, mainly defined by the lateral contrast of the resistivity. Consequently, the tipper can be used to estimate the geological strike direction. Another important use of the tipper is to display its components as vectors, named induction vectors. The induction vectors (defined by the real components of Tzx and Tzy) plotted following the Parkinson-Real-Reverse-Angle convention will point to conductive zones. The tipper is then a good mapping tool to delineate more conductive zones. The depth of investigation is determined primarily by the frequency content of the measurement. Depth estimates from any individual sounding may easily exceed 20 km. However, the data can only be confidently interpreted when the aperture of the array is comparable to the depth of investigation.</p>

Criteria	JORC Code explanation	Commentary																												
		<p>The inversion model is dependent on the data, but also on the associated data errors and the model norm. The inversion models are not unique, may contain artefacts of the inversion process and may not therefore accurately reflect all the information apparent in the actual data. Inversion models need to be reviewed in context with the observed data, model fit. The user must understand the model norm used and evaluate whether the model is geologically plausible.</p> <p>For this project, 2D inversions were performed on the TITAN/EMAP profiles data. For each profile, we assume the strike direction is perpendicular to the profile for all sites: the TM mode is then defined by the inline E-field (and cross line H-field); no TE mode (crossline E-field) were used in the 2D inversions.</p> <p>The 2D inversions were performed using the TM-mode resistivity and phase data interpolated at 6 frequencies per decade, assuming 10% and 5% error for the resistivity and phase respectively, which is equivalent to 5% error on the impedance component Z. No static shift of the data has been applied on the data.</p> <p>The 3D inversion was carried out using the CGG RLM-3D inversion code. The 3D inversions of the MT data were completed over an area of approximately 5km x 3.5km. All MT sites from this current survey were used for the 3D inversion.</p> <p>The 3D inversion was completed using a sub sample of the MT data with a maximum of 24 frequencies at each site covering the measured data from 10 kHz to 0.01 Hz with a nominal 4 frequencies per decade. At each site, the complete MT complex impedance tensors (Zxx, Zxy, Zyx, and Zyy) were used as input data with an associated error set to 5% on each parameter. The measured tipper data (Tzx, Tzy) were also used as input data with an associated error set to 0.02 on each parameter. A homogenous half space with resistivity of 100 Ohm-m was used as the starting model for this 3D MT inversion. A uniform mesh with 75 m x 75 m cell size was used in horizontal directions in the resistivity model. The vertical mesh was defined to cover the first 4 km. Padding cells were added in each direction to accommodate the inversion for boundary conditions. The 3D inversion was run for a maximum of 50 iterations.</p> <p>In addition a total of 129 samples distributed along 12 holes were analysed to measure the resistivity (Rho (Ohm*m) and chargeability properties (Chargeability M and Susceptibility (SCPT 0.001 SI) . The equipment used for the analyses was the Sample Core IP Tester, manufactured by Instrumentation GDD Inc. It should be noted that these measures should be taken only as first order estimate, and not as “absolute” (true) value as readings by the field crew were not repeated and potentially subject to some errors (i.e. wrong size of the core entered in the equipment).</p> <p>Colorado V:</p> <p>Exploration Target:</p> <p>An Exploration Target for two mineralized zones on the Colorado V mining concession has been made using surface gold in soil anomalies, drill hole geological and assay information and panel sampling from an adit at one of the targets.</p> <table><tr><th>Exploration Target Anomaly A</th><th>Unit</th><th>Low estimate</th><th>High Estimate</th></tr><tr><td>Surface area (100 ppb Au in soil envelope):</td><td>m²</td><td>250000</td><td>250000</td></tr><tr><td>Depth</td><td>m</td><td>400</td><td>400</td></tr><tr><td>Bulk Density</td><td>kg/m³</td><td>2600</td><td>2750</td></tr><tr><td>Tonnage</td><td>Mt</td><td>260</td><td>275</td></tr><tr><td>Grade Au</td><td>g/t</td><td>0.4</td><td>0.7</td></tr><tr><td>Grade Ag</td><td>g/t</td><td>1.5</td><td>2.5</td></tr></table>	Exploration Target Anomaly A	Unit	Low estimate	High Estimate	Surface area (100 ppb Au in soil envelope):	m ²	250000	250000	Depth	m	400	400	Bulk Density	kg/m ³	2600	2750	Tonnage	Mt	260	275	Grade Au	g/t	0.4	0.7	Grade Ag	g/t	1.5	2.5

		<p>The potential quantity and grade of the Colorado V Exploration Target is conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource and that it is uncertain if further exploration will result in the estimation of a Mineral Resource.</p> <p>The following is an explanation of the inputs used in formulating the Exploration Target.</p> <ul style="list-style-type: none"> • Surface Area: The surface area of the target has been estimated by projecting drill hole gold significant intersections vertically to the surface. The surface projection of the intersections in the drill holes coincides with the 100 ppb Au gold-in-soil anomaly contour. This area has been used to estimate the horizontal extent of the mineralization. • Depth: A depth of 400 metres from surface has been used as an estimate of the depth that an open pit and underground bulk tonnage mining project would be expected to extend. The mineralization at Colorado V is controlled by steeply plunging / dipping intrusions and breccia which is expected to extend to at least 400m depth from surface. • Bulk Density: The bulk density is based on geological observations of the rocks that host the mineralization. Typical bulk densities for these rock types are in the range used. • Gold and Silver grades: The gold and silver grade range has been estimated from the weighted average and median sample grades and deviations from mean from drill core and underground panel sampling. • Proportion of tonnage above cut-off grade: These values are estimates based on drill hole intersection grade continuity down-hole assuming that not all of the Target volume, if sampled would be above the economic cut-off
