

# Trenching results extend mineralisation trend at Lyell to 1km

Siren Gold Limited (ASX: **SNG**) (Siren or the Company) is pleased to provide an update on the significant potential of its Lyell Prospect.

## Highlights

- The Mt Lyell North 1km long Au Zone has been identified as a significant new discovery, with previous trench results including; **3.0m @ 19.1g/t Au, 7m @ 13.8 g/t Au, and 8m @ 6.2g/t Au.**
- Three new trenches have been excavated at the NW and SE ends of the 1km long soil anomaly confirming the presence of gold in all three trenches returning;
  - **2.4m @ 3.2g/t Au (LYTR010);**
  - **1.0m @ 6.0 g/t Au (LYTR011), and**
  - **2.0m @ 3.1g/t Au (LYTR012).**
- **All 10 trenches at Mt Lyell North have intersected mineralisation** greater than 1.9g/t Au.
- LYTR010 sampled 50m to the north of the outcropping Victory reef intersected in disseminated mineralisation. This trench extends the Victory mineralisation to around 75m and is open to the NW and SE.
- Trenches LYTR011 and LYTR012 were excavated at the SE end of the 1km anomaly. Both trenches exposed disseminated acicular arsenopyrite mineralisation.
- If the mineralisation plunges steeply to the north, then there could be a 700m wide shoot between trenches LYTR010 and LYTR011.
- There is a 400m elevation difference between the outcropping reef at the SE and NW ends of the 1km strike, indicating that the mineralisation may extend down plunge for at least 400m.
- 18 drill pads have been applied for, with drilling scheduled for quarter 4 2023.

## Background

The **Lyell Goldfield** is located 40kms north of Reefton (Figure 1), where gold bearing quartz lodes were worked over a continuous strike length of 5kms. The **Lyell Goldfield** is the northern extension of the **Reefton Goldfield** that produced 2 Moz of gold at an average recovered grade of 16g/t. The project overlays the historic **Alpine United** mine, which produced ~80koz of gold at an average recovered grade of ~17g/t between 1874 and closing in 1912.

Several other small mines, such as the Break of Day, Tyrconnell and United Italy, also operated historically north of the Alpine United mine. These are reported to have worked high grade quartz leaders up to about 10 cm width but only produced only small tonnages.

Three historical quartz reef mines, Titchborne, Victor Emanuel and the United Victory, were located further north. Not much is known about the Titchborne and Victor Emanuel, although excerpts from historical newspapers indicate they worked quartz reefs around 1880, with mines serviced by the Titchborne stamper battery. The United Victory Mine was worked over at least two levels.

Soil sampling has confirmed a NNW trending 4km long anomalous gold zone between the Alpine United and United Victory mines (Figure 2). The Break of Day mine is also located along this anomaly. The soil samples have identified several anomalous areas which may represent mineralised shoots similar to those seen at Alexander River. The Alpine United mine shoot plunged ~45° to the north and was mined down to 500m below the surface and 750m down plunge and is open at depth (Figure 3). A total of 80koz @ 17g/t Au were recovered from the mine.

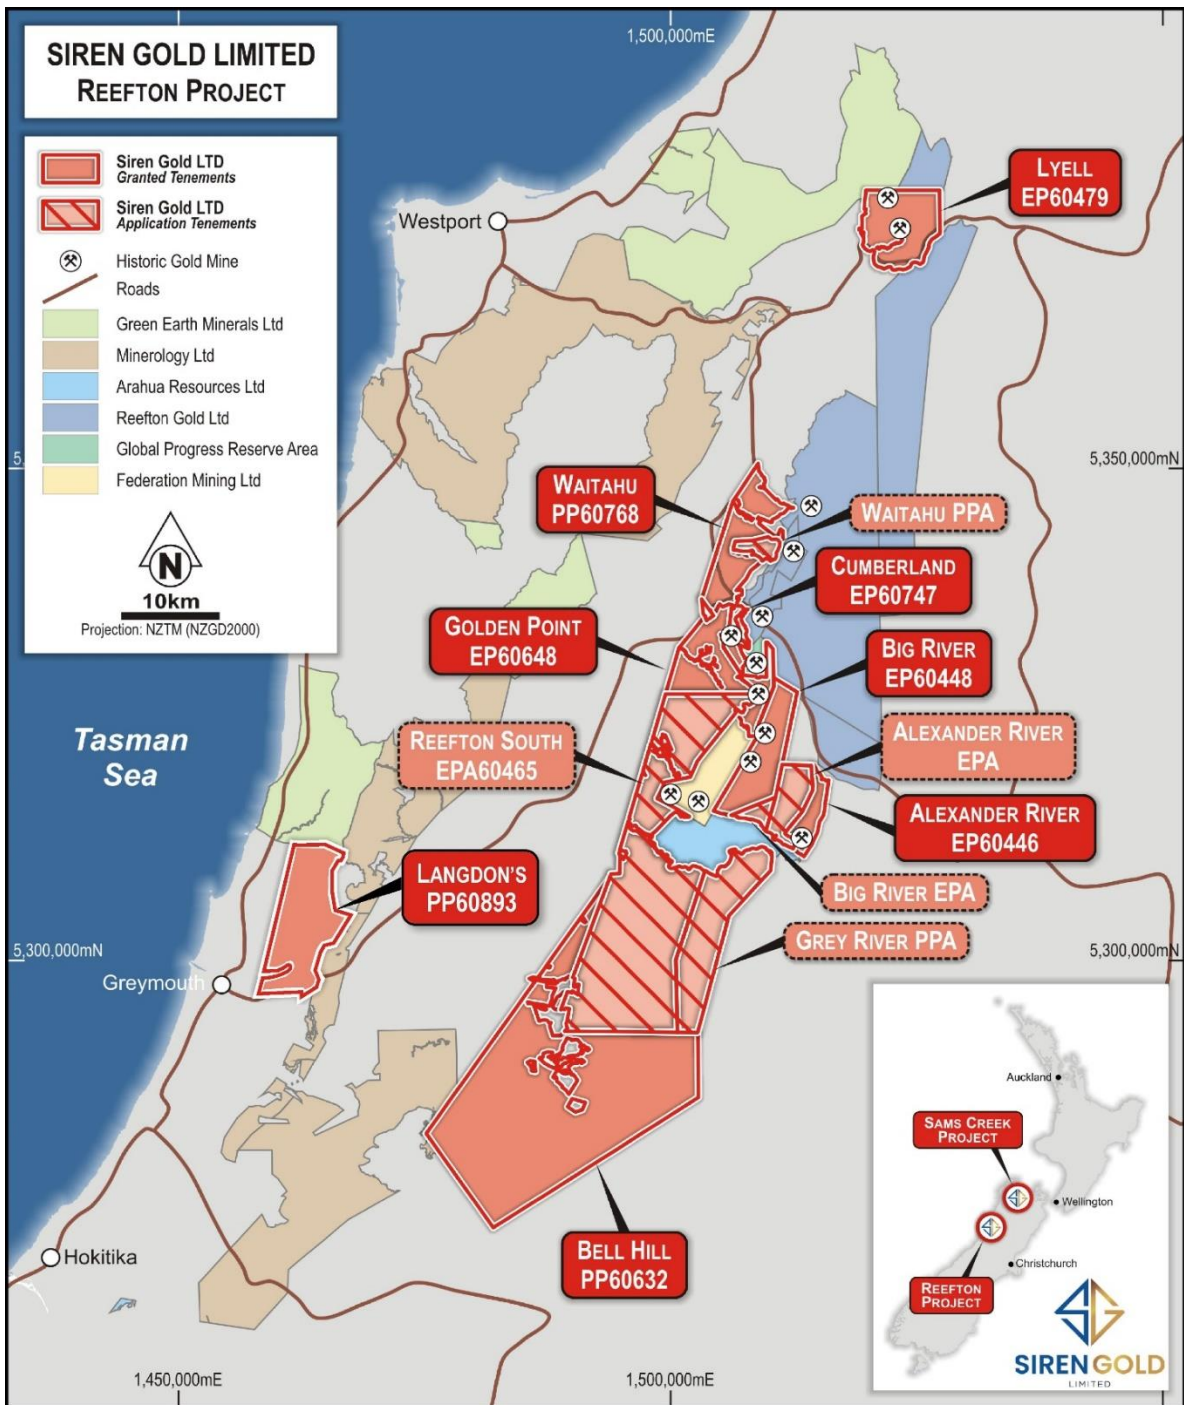

Figure 1. Reefton Tenement Map

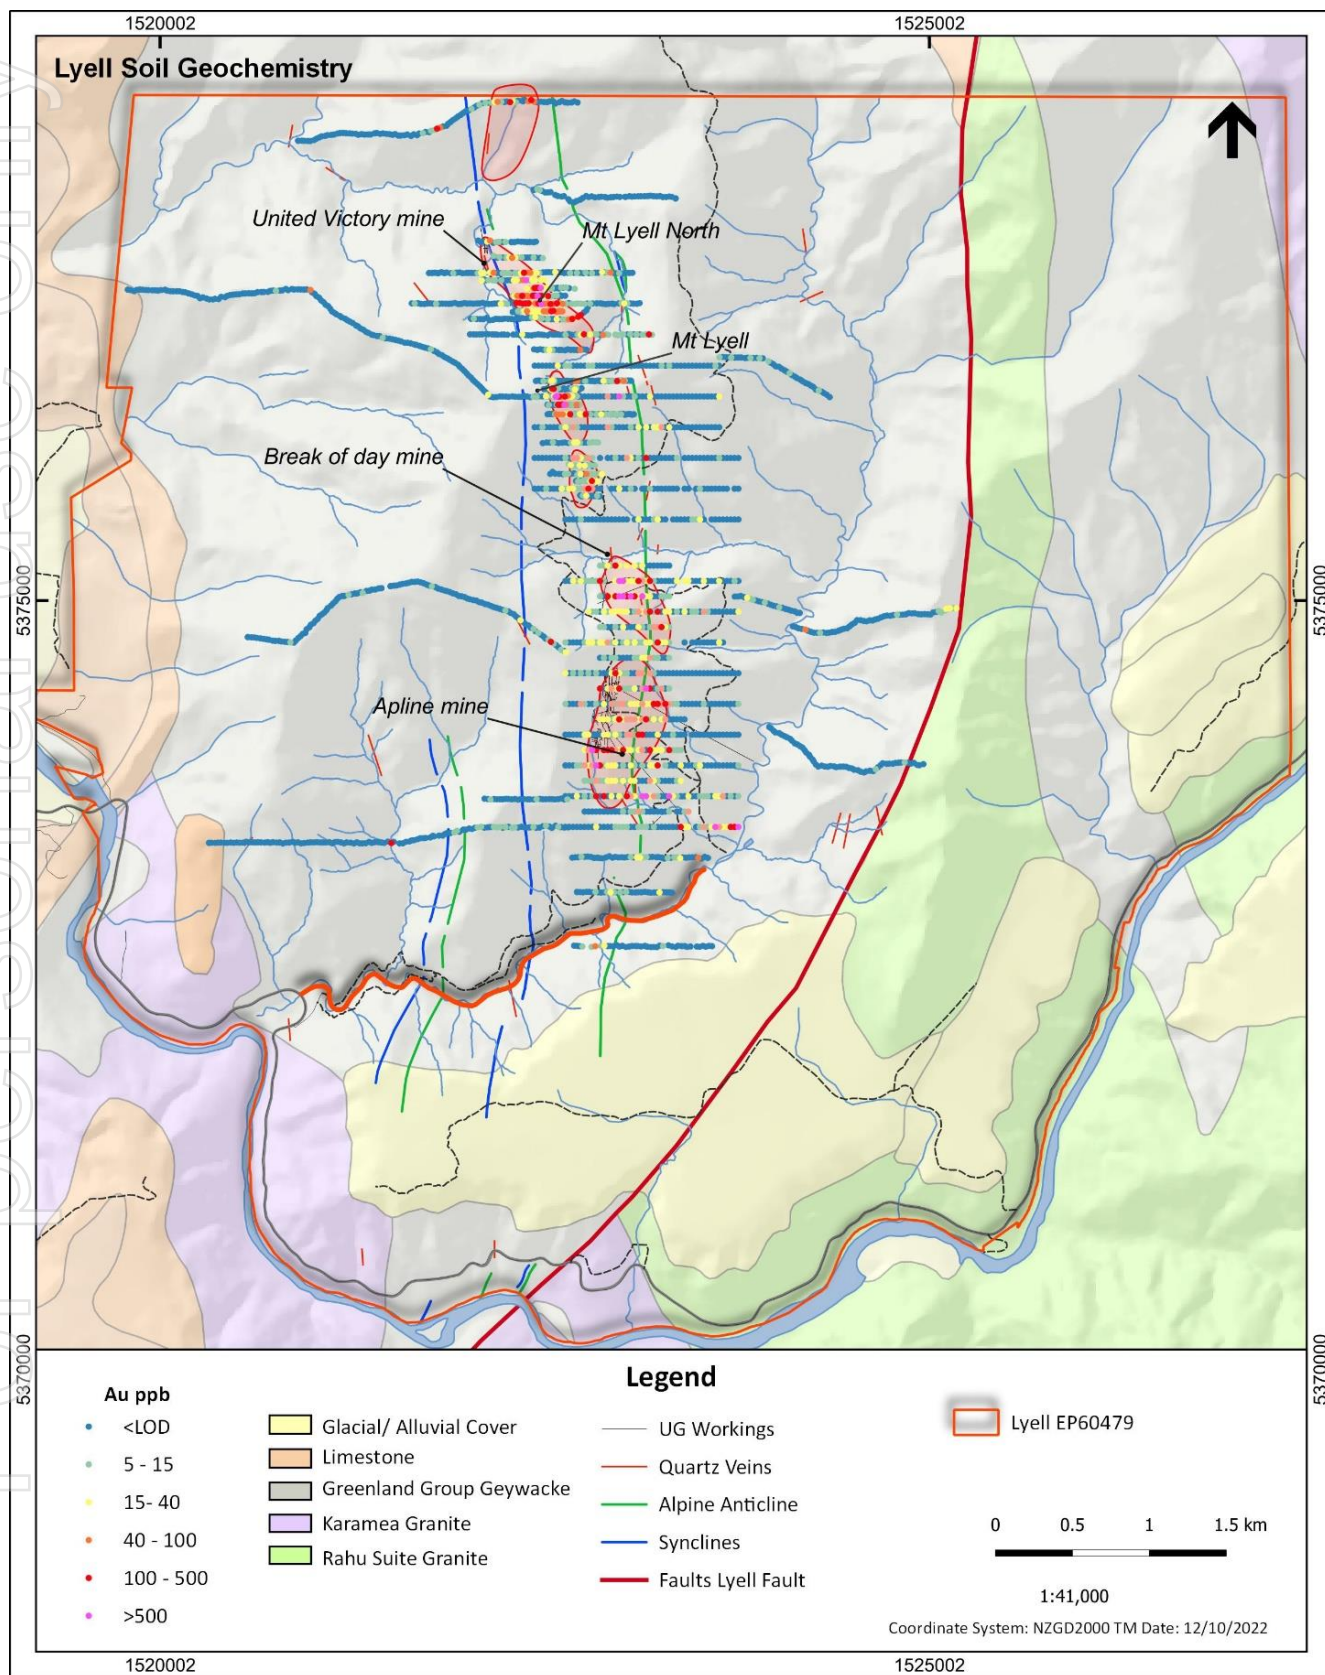

Figure 2. Lyell gold soil geochemistry

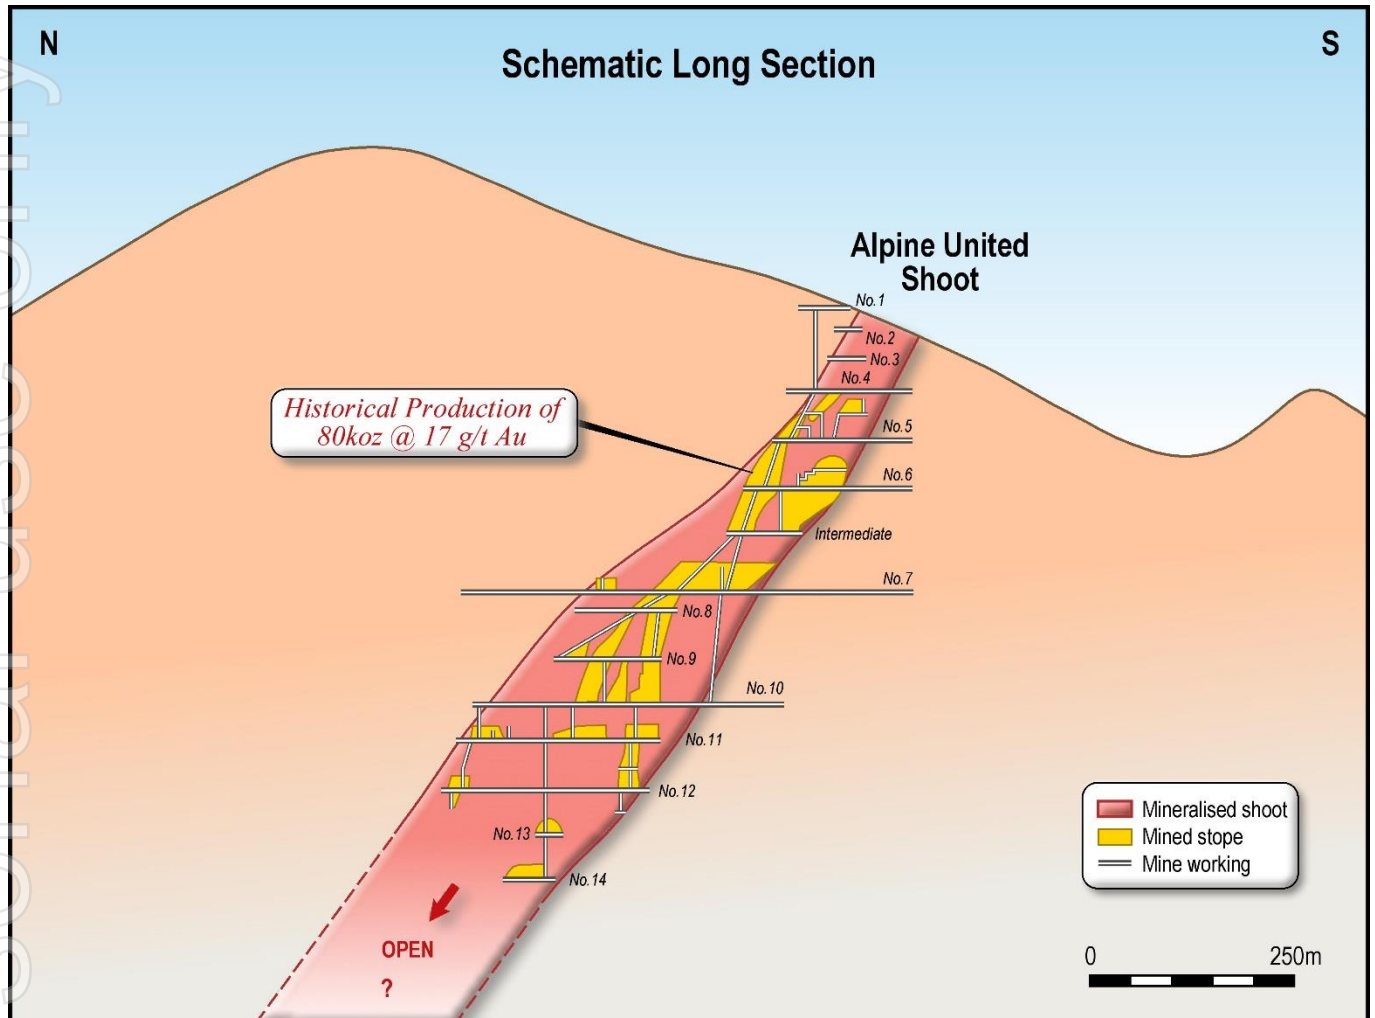

Figure 3. Alpine United Mine longitudinal section.

## Trenching

As previously reported (refer announcement dated 24 October 2022), seven trenches or channel samples were sampled along the 1km long Mt Lyell North - Victory gold:arsenic soil anomaly. The mineralisation intersected comprised mineralised quartz veins with disseminated acicular arsenopyrite.

**LYTR001** exposed a 7m thick mineralised zone that averaged **7m @ 13.8g/t Au**, with 1m grades as high as **25g/t Au**. The true thickness of the intersection is interpreted to be around 5m.

**LYTR002** exposed an 8m thick mineralised zone that averaged **8m @ 6.3g/t Au**, with 1m grades as high as **29.7g/t Au**. The true thickness of this intersection is also interpreted to be around 5m.

**LYTR009** sampled an exposed 0.4m quartz reef with significant visible gold, surrounded by disseminated arsenopyrite mineralised sandstone that averaged **3m @ 19.1g/t Au** that assayed **42.0g/t Au** and 1.4g/t Au (Figures 4 and 5).

**Figure 4. Outcropping United Victory Reef exposed by recent flooding.**

**Figure 5. United Victory Reef float sample that assayed 205g/t Au**

For personal use only

Three new trenches have been excavated at the NW and SE ends of the 1km long soil anomaly (Figure 6). **LYTR010** sampled disseminated acicular arsenopyrite exposed 50m along strike to the north of the outcropping reef shown in Figure 4. There were no quartz veins and the disseminated mineralisation averaged **2.4m @ 3.2g/t Au**. This trench extends the Victory mineralisation to around 75m and open to the NW and SE.

Trenches LYTR011 and LYTR012 were excavated at the SE end of the 1km anomaly. Both trenches exposed disseminated acicular arsenopyrite mineralisation, with **LYTR011** intersecting **1m at 6.0g/t** and **LYTR012** intersecting **2m @ 3.1g/t Au**.

All 10 trenches at Mt Lyell North have intersected mineralisation greater than 1.9g/t Au (Figure 6 and Table 1). If a 60° north plunge is interpreted similar to the Alpine United Shoot (Figure 3), then there could be a 700m wide shoot or series of shoots between trenches LYTR010 and LYTR011. There is a 400m elevation difference between the outcropping reef at the SE (900mRL) and NW (500mRL) ends of the 1km strike (Figure 7), indicating that the mineralisation may extend down plunge for at least 400m.

Recent mapping and trenching indicated that the Mt Lyell North – Victory Reef appears to be dipping steeply to the east, similar to the reef at the Alpine United mine. Subsequently, the location of some of the planned drill pads have been moved to better focus on targeting the Mt Lyell North mineralised zone, including some new pads to target the Victory Reef (Figure 7). This revised application, which includes 18 drill pads, was lodged with the Department of Conservation (DoC) this week, with drilling scheduled for quarter 4 2023.

**Table 1. Mt Lyell North - Victory Trench Results**

Trench ID	Mineralised Zone	Interval (m)	Au g/t
LYTR001	Mt Lyell North	7.0	13.8
LYTR002	Mt Lyell North	8.0	6.3
LYTR003	Mt Lyell North	2.5	3.2
LYTR004	Mt Lyell North	1.0	1.9
LYTR005	Victory	1.7	11.5
LYTR008	Victory	1.1	36.0
LYTR009	Victory	3.0	19.1
LYTR010	Victory	2.4	3.2
LYTR011	Mt Lyell North	1.0	6.0
LYTR012	Mt Lyell North	2.0	3.1

## Competent Person Statement

The information in this announcement that relates to exploration results is based on, and fairly represents, information and supporting documentation prepared by Mr Paul Angus, a competent person who is a member of the Australasian Institute of Mining and Metallurgy. Mr Angus has a minimum of five years' experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a competent person as defined in the 2012 Edition of the Joint Ore Reserves Committee Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Angus is a related party of the Company, being the Technical Director, and holds securities in the Company. Mr Angus has consented to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <li>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</li> <li>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</li> </ul>	<ul style="list-style-type: none"> <li>The Company's Reefton tenements, both granted (8), and applications (2), are shown in Figure 1 of this announcement. All Siren tenements or applications are 100% owned by Reefton Resources Pty Limited (RRL) a fully owned NZ subsidiary of Siren. All the tenements are within the Department of Conservation (DoC) estate. Minimum Impact Activity (MIA) Access Agreements have been issued by DoC for Alexander River, Big River, Lyell, Reefton South and Golden Point. DoC Access Agreements (AA) that allows drilling, have been granted for Alexander River (47 drill pads), Big River (40 drill pads), Golden Point (22 pads) and Auld Creek (20 pads). An AA application for Lyell (18 Pads) has been lodged and is being assessed by DoC.</li> </ul>
Exploration done by other parties	<ul style="list-style-type: none"> <li>Acknowledgment and appraisal of exploration by other parties.</li> </ul>	<ul style="list-style-type: none"> <li>All exploration prior to 2021 was completed and documented by Ausex Resources Pty Limited.</li> <li>Exploration from 2021 was completed by Siren.</li> <li>The West Coast Airborne Magnetic Survey, acquired by NZ government during the period between April 2011 and March 2013 was completed by Thomson Aviation. The survey was conducted in two blocks and in three sections totaling 86,763 km<sup>2</sup> along the West Coast of South Island. Please refer to MR5000 for more details about the technical data and acquisition reports for the survey.</li> </ul>
Geology	<ul style="list-style-type: none"> <li>Deposit type, geological setting and style of mineralisation.</li> </ul>	<ul style="list-style-type: none"> <li>Gold mineralisation in the Reefton and Lyell Goldfields is structurally controlled; the formation of the different deposit types is interpreted to be due to focussing of the same hydrothermal fluid into different structural settings during a single gold mineralisation event, however, some of the deposits (e.g. Globe-Progress, Big River) appear to have been re-worked, with gold and sulphide mineral remobilisation having occurred during a later phase of brittle deformation.</li> <li>In general, two end members of mineralisation styles exist, the "Blackwater Style" is comprised of relatively undeformed quartz lodes; whilst the "Globe-Progress Style" comprises highly deformed quartz - pug breccia material with a halo of disseminated</li> </ul>

Criteria	JORC Code Explanation	Commentary
		<p>sulphide mineralisation.</p> <ul style="list-style-type: none"> <li>• Three main structural deposit types appear to occur in the Reefion Goldfield. The Globe-Progress deposit occupies a distinct structural setting, where there is a clear break in the continuity and tightness of early folding. This break defines the east-west striking Globe-Progress shear zone. The fault splays off the Oriental-General Gordon shear zone. The geometry of the fault structure has allowed dilation and quartz vein deposition more or less contemporaneously with shearing, hydrothermal alteration, and low-grade mineralisation of the wall rocks. The broad disseminated mineralisation that now surrounds the Globe-Progress ore body is thought to have been formed by later movement on fault planes, in the presence of fluids, which led to some mobilisation and recrystallisation of metals and formed the halo of mineralised country rock. The Big River deposit shows similar paragenesis to Globe-Progress, except for the fact that the disseminated sulphide halo is not as extensive.</li> <li>• The second structural deposit type hosts most gold deposits ie., Big River South, Scotia, Gallant and Crushington, however, these are typically small, narrow, steeply plunging and consequently generally sub-economic. These deposits have formed in reverse shear zones that are parallel or sub-parallel to cleavage and bedding. The attitude of these deposits has not allowed the formation of significant shear zones, dilatant zones or fluid channel ways and consequently the deposits formed tend to be small. Most mineralised zones occur as small-scale versions of the other two deposit types, formed in small, localised transgressive structural settings that are conducive to those deposit types.</li> <li>• The third deposit type occurs as steeply dipping transgressive dilatant structures, which are typically northeast trending (Blackwater). Gold mineralisation is interpreted to have formed when an earlier, favourably orientated shear zone became a zone of weakness under strike-slip movement. This dextral strike-slip movement created a locus for dilation and fluid channelling caused by periodic fluid pumping and over pressuring during the hydrothermal mineralising event.</li> </ul>
<p><i>Trench and Drillhole Information</i></p>	<ul style="list-style-type: none"> <li>• <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes:</i> <ul style="list-style-type: none"> <li>○ <i>easting and northing of the drillhole collar</i></li> <li>○ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drillhole collar</i></li> <li>○ <i>dip and azimuth of the hole</i></li> <li>○ <i>down hole length and interception depth</i></li> <li>○ <i>hole length.</i></li> </ul> </li> <li>• <i>If the exclusion of this information is justified on the basis that the information is not Material and this</i></li> </ul>	

## Criteria

Data aggregation methods

- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.
- Where aggregate intercepts incorporate short

- Drilling results presented have used a weighted average when presenting drilling intercepts, hence, any potential sample length bias has been accounted for.
