

UPDATED PORT GREGORY JORC MINERAL RESOURCE INCREASED BY 23%

- Completed Mineral Resource estimate includes 5.9 Mt of contained garnet, representing approximately 5 years of current global demand¹.
- 5.4 Mt of the contained Total Heavy Mineral (THM) is within the Measured and Indicated JORC category
- Updated JORC Mineral Resource estimate of 166 Mt @ 4.0% Total Heavy Minerals (THM) (Figure 1)
 - **Measured Mineral Resource:** 126 Mt @ 3.8% THM
 - **Indicated Mineral Resource:** 20 Mt @ 6.5% THM
 - **Inferred Mineral Resource:** 20 Mt @ 2.9% THM
- Majority of Mineral Resource (71% of contained garnet) is in the Measured JORC category
- 89% garnet fraction within the THM
- 95% Valuable Heavy Mineral (VHM) in the THM fraction which is well above industry averages with minor ilmenite and rutile credits
- Upside potential to the Mineral Resource with mineralisation open to the south and north within HVY's tenure
- Work to commence on pit optimisation and mine planning to produce mining inventory to feed into upcoming Pre-Feasibility Study (PFS) for Port Gregory.
- Bulk sampling for end user acceptance testing scheduled to commence in 2H CY2023

Heavy Minerals Limited (ACN 647 831 833) ("HVY", "Heavy Minerals" or the "Company") is pleased to announce the updated Mineral Resource estimate for the Port Gregory Garnet Project of 166 Mt @ 4.0% (THM) at a 2.0% THM cut-off grade. The 89% garnet fraction of the THM is in line with previous results resulting in 5.9 Mt of contained garnet.

Figure 1: Port Gregory Block Model showing JORC Mineral Resource classification

Significant resource upside potential still exists with mineralisation open to the south within HVY' tenure (Figure 2). The updated Mineral Resource estimate increases the tonnage of material above the cut-off grade by 23% and results in an increase in contained garnet of 20%.

¹ TZMI Garnet Market Data (Project 11759) Jan 2021.

CEO, Mr. Andrew Taplin said:

“The Company was confident that there would be a significant increase to the size and quality of the resource following the most recent infill and extension aircore drilling program with the Company meeting all expectations. The updated Mineral Resource estimate now credibly positions HVY to be the next potential garnet producer in the Port Gregory region. The updated Mineral Resource estimate will inform the Port Gregory Project Pre-Feasibility Study that is scheduled to commence imminently and is expected to contribute further value to the already strong financial metrics. The Company remains of the view that its Port Gregory Garnet Project is a world-class asset.”

Figure 2: Port Gregory Block Model showing THM grade

JORC Mineral Resource Estimate

The Mineral Resource estimate for Port Gregory is reported in accordance with the JORC Code (2012 edition). Further information about the Port Gregory Mineral Resource is set out in the *Summary of Resource Estimate Reporting Criteria* section below and includes the information prescribed by ASX Listing Rule 5.9. This information should be read in conjunction with the applicable explanatory information provided for the purposes of Table 1 of the JORC Code, included in Appendices 1 to 3 of this announcement.

The Port Gregory Mineral Resource estimate is reported above a cut-off grade of 2.0% THM and is presented below in Table 1. This table conforms to guidelines set out in the JORC Code (2012).

The Mineral Resource outline for the Port Gregory deposit is presented in Figure 8 and the JORC Classification is presented in Figure 9.

At a cut-off grade of 2.0% THM the Port Gregory deposit comprises a total Mineral Resource of 166 Mt @ 4.0% THM, 10% SLIMES and 9% OS (oversize) containing 6.6 Mt of THM with an assemblage of 89% garnet, 4% ilmenite, 2% rutile/anatase and 1% zircon. The JORC categories are specifically stated as:

- a Measured Mineral Resource of 126 Mt@ 3.8% THM, 10% SLIMES and 9% OS containing 4.7 Mt of THM with an assemblage of 88% garnet, 4% ilmenite, 2% rutile/anatase and 0.6% zircon;

- an Indicated Mineral Resource of 20 Mt @ 6.5% THM, 8% SLIMES and 9% OS containing 1.3 Mt of THM with an assemblage of 92% garnet, 4% ilmenite, 1% rutile/anatase and 1% zircon; and
- an Inferred Mineral Resource of 20 Mt @ 2.9% THM, 11% SLIMES and 13% OS containing 0.6 Mt of THM with an assemblage of 89% garnet, 4% ilmenite, 2% rutile/anatase and 1% zircon.

Table 1: Port Gregory - 2023 Mineral Resource Estimate

Summary of Mineral Resource estimate ⁽¹⁾								THM Assemblage ⁽²⁾				
Classification	In Situ		In Situ	BD (gcm ⁻³)	THM (%)	SL (%)	OS (%)	Garnet (%)	Ilmenite (%)	Zircon (%)	Rutile (%)	Other (%)

Grand Total	166	6.6	5.9	1.7	4.0	10	9	89	4	1	2	5

Notes:

- (1) Mineral Resource reported at a cut-off-grade of 2.0% THM.
- (2) Mineral assemblage is reported as a percentage of in situ THM content.

Company and Projects Overview

The Port Gregory Project Mineral Resource estimate of 166 Mt @ 4.0% THM contains 5.9 Mt of garnet which equates to approximately five years of the current global garnet¹ demand. A Mineral Resource containing 5.9 MT garnet with ilmenite and rutile credits is an enviable position for the Company to be in after such a short period following listing on the ASX in September 2021. With 91% of the garnet resource in the Measured and Indicated Mineral Resource categories, the Company now has the required resource knowledge to inform the upcoming PFS.

The assemblage of 89% garnet, 4% ilmenite, 2% rutile and 1% zircon, equates to a 95% VHM fraction which is higher than the industry average and provides HVY with numerous options with respect to developing the project. With the Mineral Resource estimate now defined, the project moves into the PFS phase, which is where the Company can build on the positive study work from the Scoping Study which was completed in late 2022.

In the coming weeks, pit optimisation work will be undertaken by IHC Mining to test the areas of the deposit where mineralised zones could be converted into potential mining inventory with the aim of informing the PFS. HVY's future exploration programs at Port Gregory will be driven by a need to improve the areas of the deposit currently sitting in the Inferred and Indicated categories, potentially extend the deposit further north and south and provide mining pit edge definition. Mining test pit activities are also planned to test the digging characteristics of near surface material and for the purpose of collecting bulk sample from representative sites for the bulk metallurgical testwork. Ultimately this metallurgical testwork is planned to be completed to DFS level in anticipation of a successful PFS phase.

The project is located on private freehold land with no identified heritage sites² and no known threatened ecological communities (TEC's). The current landowners are proactively working with HVY and GMA Garnet Group (GMA) in respect to land access, exploration activities and mining rights. These factors, though not definitive in ensuring a positive outcome for HVY moving to mine development, are certainly positive indicators for the future.

The Company's potential is further enhanced by the recent greenfields discovery at the "Red Hill Garnet Project" which lies 30 km to the South of Port Gregory which highlights the opportunity for additional mineral deposits across HVY's extensive tenure holding which will add to HVY's global resource package. An Exploration Target has already been defined at the Red Hill Project and further resource development work will be undertaken in the next 12 months prior to a Scoping Study being undertaken.

Industrial garnet demand is forecast to outstrip supply in the coming years with a widening deficit forecast from 2024 onwards³ (Figure 3) unless additional supply is brought to market. Pricing has responded accordingly with garnet pricing increasing 20% Y.O.Y in the USA, reaching US\$325 per tonne (garnet concentrate) in 2021.

Figure 3: Garnet Supply/Demand Forecast

² Schwede, M. 1993. The archaeology of the Geraldton Coastal Region. A Report for the Aboriginal Communities of the Geraldton Coastal Region.

³ TZMI Garnet Market Data (Project 11759) Jan 2021.

Future alluvial almandine garnet produced from the Port Gregory region will reduce the global supply gap and will likely displace inferior hard rock garnet that is less preferred by end users, typically due to its reduced recyclability.

Key Appointments:

IHC Mining (IHC) were engaged to prepare the Mineral Resource estimate declared in this release and also as the Study Managers for the Port Gregory Scoping Study and Preliminary Economic Assessment (PEA). IHC are an industry leading Mineral Sands Engineering Consultancy with over 100 years of mineral sands and project build experience. The Study Team selected for the project is led by Engineers that have recently worked directly on the RDG Lucky Bay Garnet mine project. The Company intends to engage IHC Mining to complete the upcoming PFS

With extensive, in-house experience over a complete suite of services, IHC Mining's capabilities include:

- Geology;
- Metallurgical testwork;
- Mining Engineering and Mine Planning;
- Engineering;
- Equipment supply ; and
- Project delivery, including commissioning.

IHC are expected to deliver an industry leading and robust PFS, thereby maximising the value proposition for HVY for the Port Gregory project. This includes the most practical and economically feasible project development pathway for HVY, thereby delivering the maximum value for shareholders.

Mr. Matt Robbins, Principal of Allied Project Developments has been appointed as HVY's client representative following the successful completion of the Scoping Study. Mr. Robbins will act as HVY's client representative during the PFS. Mr. Robbins has more than 20 years project management experience with numerous roles in the Mineral Sands and Industrial Minerals sector. Furthermore, Mr. Robbins has worked extensively on Projects in the Mid-West region of Western Australia and has recent experience working with a variety of stakeholders and projects that intend to ship from the Port of Geraldton. To have someone of Matt's calibre join the HVY team will bolster the in-house expertise and ensure that HVY achieves optimal outcomes from the various studies to be undertaken between now and a potential decision to mine.

Summary of Resource Estimate Reporting Criteria

Regional Geology:

The heavy minerals in the known deposits in Western Australia were ultimately, but indirectly, derived from the weathering of crystalline igneous rocks in the Archean Yilgarn Block. Heavy mineral grains derived from the Yilgarn Block were initially deposited in thick sequences of Mesozoic sediments that filled the Perth Basin. There was some local degree of concentration of heavy minerals in these sediments relative to the primary source areas, in places reaching potential ore grades. For example, the Beenup deposit is thought to be Mesozoic in age. Erosion and reworking of the relatively soft Mesozoic sediments, particularly those parts of the stratigraphic sequence dominated by coarse sandstones and grits, subsequently released the heavy minerals into the strand deposits.

The project area lies in the most northerly part of the Perth Basin, on the western side of the Northampton Block.

The Tamala Limestone, a belt of coastal limestone extends up to 8 km inland. It is composed of eolianite, which accumulated originally as coastal sand dunes in the late Pleistocene. This has developed over a basement of late Cretaceous age Winning Group sediments which can be seen outcropping near Yanganooka Well. Several erosional scarps have been developed on the seaward side of the Tamala Limestone, one of which is equivalent to the strand-line mineralisation to the south. Fossil crescent dunes can also be distinguished on top of the massive limestone area which may be of early Pleistocene age.

Mobile coastal dunes, equivalent to the Safety Bay Sand, are extensively developed and in the northern part transgress over the Tamala Limestone. They are divided into a coastal zone of large mobile longitudinal and crescent dunes, from an inner zone of older, stabilized and more sparsely distributed crescent dunes.

Project Geology:

The local geology is dominated by dunal accumulations of grey to brown to white sand and Limesand. These sediments are thought to be Quaternary in age and overlay Silurian aged Tumblagooda Sandstone which is composed of a Red-bed sequence of sandstone; siltstone; and minor conglomerate. They locally appear to have been deposited in an embayment eroded into the Tumblagooda Sandstone.

The Limesand has been partially indurated with carbonate cementation and sandy limestone is locally developed. The older the formation the more induration appears to be developed.

Drilling Techniques:

Aircore (AC) drilling was used to obtain samples for analysis with an additional 162 AC holes for 5,180.5 metres and 5,329 samples, drilled to an average depth of 33 m. 9 holes were twinned as a part of this drill program. Bostech Drilling was engaged to drill out this program (Figure 5) with their Truck mounted Drillboss 200 AC rig. These holes and assays were added to the already drilled holes and assay results. The drilling metres for the different phases of exploration are presented in Table 2 below.

Table 2: Port Gregory - 2023 Mineral Resource Estimate

Drilling Phase	Drilling Company	Metres	%
1	BOSTECH	4428.00	41%
	HORNET	626.60	6%
	TERRAIN	593.90	5%
Total		5648.50	52%
2	BOSTECH	5180.50	48%
Total		5180.50	48%
Grand Total		10829.00	100%

AC drill sample recovery is monitored by reviewing the sample mass of the total weight of the 1.0 m interval weighed both on site as a wet sample and at the laboratory as a dried sample. The entire sample passes through the on-board rotary splitter and the sample collected in a pre-numbered calico bag. The bulk reject is not collected and is shovelled back down the hole upon completion

The drilling program was undertaken in dry conditions with holes drilled vertically and spaced at 100 m across strike and 250 m along strike. The program involved in-filling the previous 500 m spaced drill lines and extending the footprint of the defined Mineral Resource further to the east. The spacing / density of the holes is deemed to adequately define the mineralisation in the Mineral Resource estimate and this was confirmed with variography and an assessment of the mineral assemblage composites which determine the mineralogy.

Sampling Techniques and Sample Analysis Methodology:

The aircore drill samples have an average range between 6 kg and 9 kg and were split using the rig based rotary splitter to between 1.5 kg and - 2.5 kg. The split samples were "panned" and visually estimated for THM on site.

The remainder of the split samples (laboratory sample) were transported to Diamantina Laboratories for assaying where the laboratory sample was dried for up to 24 hours @ 105-110 degrees Celsius. The sample was then loosened until friable and passed through a rotary splitter to take a 250 g sub-sample. This sub-sample was then wet screened on a Sweco vibrating screen deck at a top aperture of 1 mm (oversize - OS) and a bottom screen of 45 µm (SLIMES fraction).

The sand fraction containing the THM (-1 mm and +45 µm) was then dried and a sub-split of approximately 70-80 g is taken using a micro riffle splitter and used for heavy liquid separation using funnels and a heavy liquid, Tetrabromoethane (TBE), with a density of between 2.92 and 2.96 gcm⁻³ to determine THM content. This sampling and sample analysis technique is considered appropriate and reliable based upon accepted industry practice. Diamantina Laboratories is considered to be an industry leading mineral sands assay laboratory.

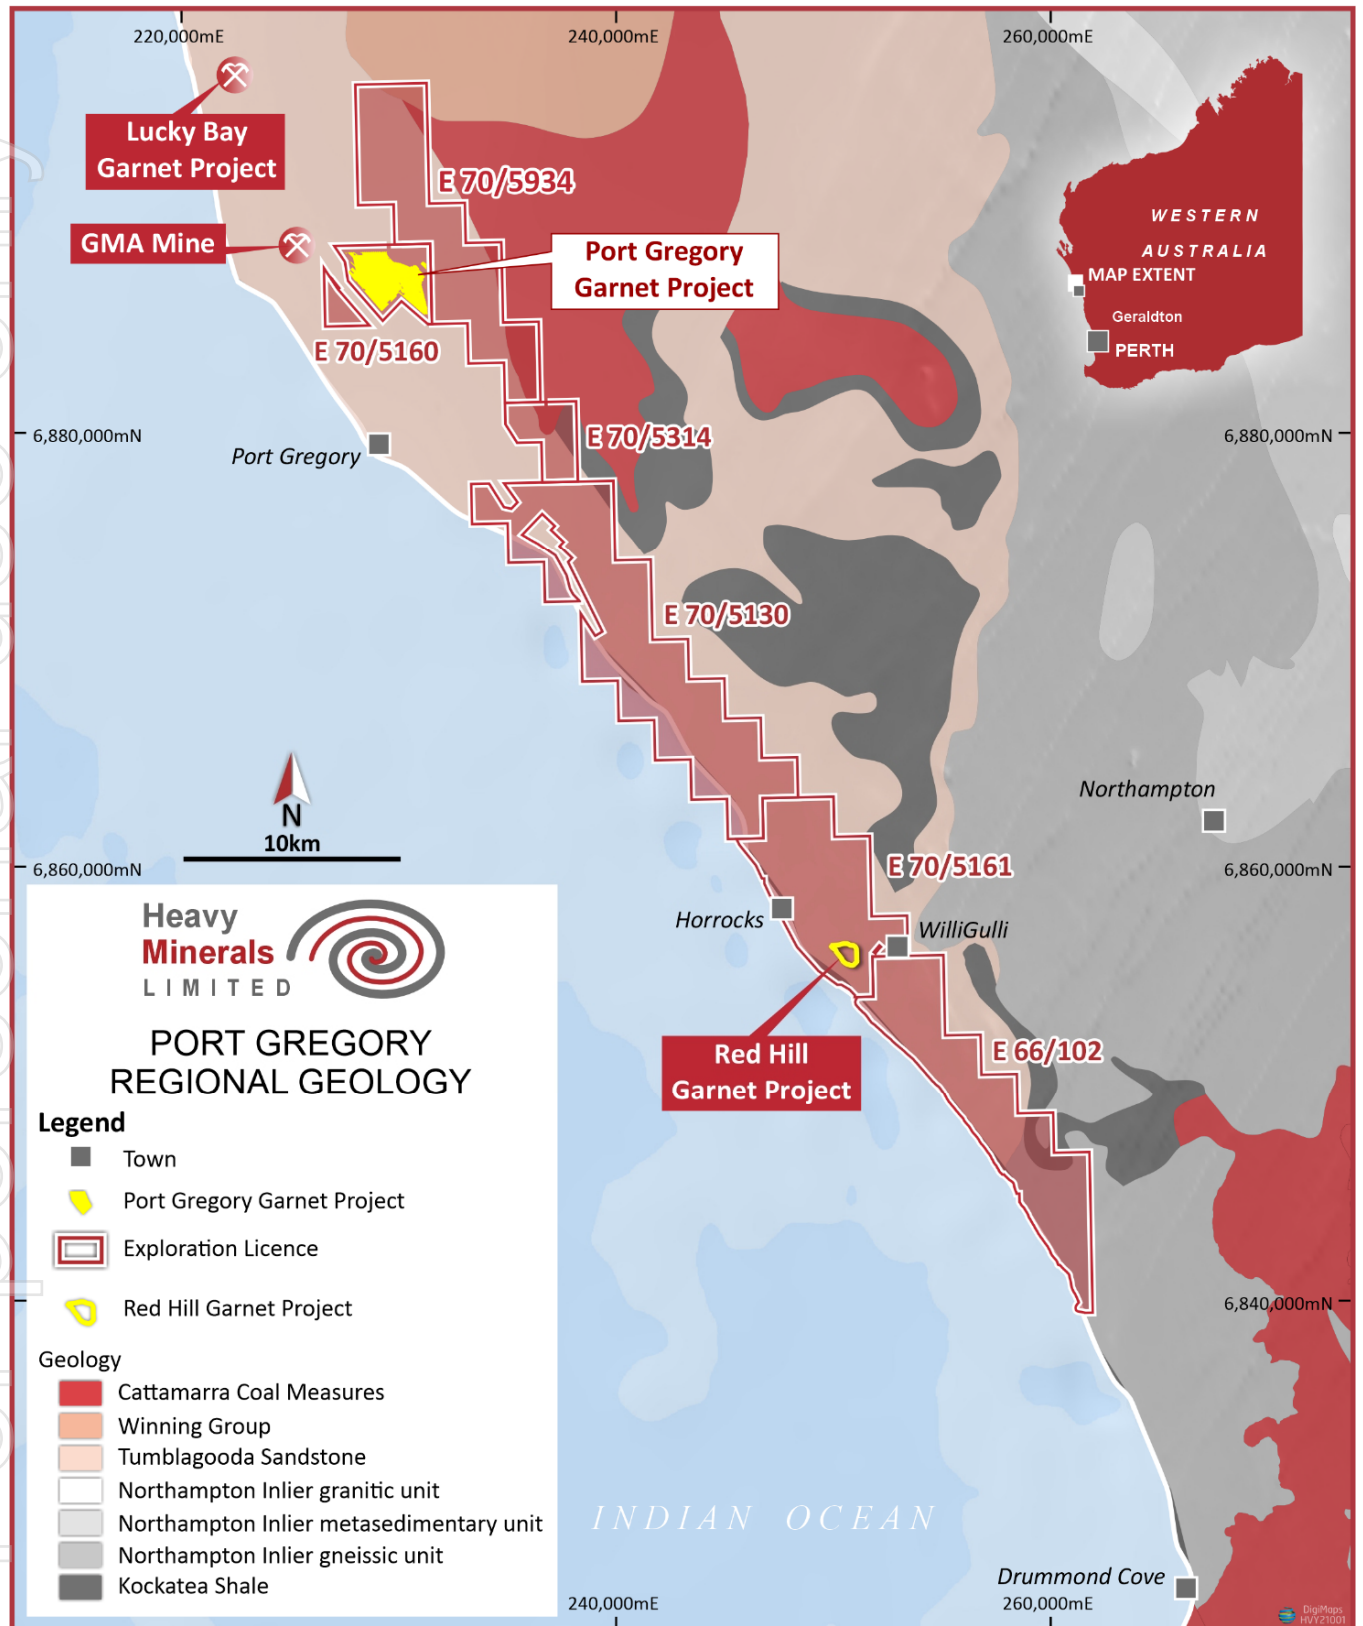

Figure 4: Port Gregory Regional Geology

Figure 5: Bostech drilling rig on site

The remainder of the split samples (laboratory sample) were transported to Diamantina Laboratories for assaying where the laboratory sample was dried for up to 24 hours @ 105-110 degrees Celsius. The sample was then loosened until friable and passed through a rotary splitter to take a 250 g sub-sample. This sub-sample was then wet screened on a Sweco vibrating screen deck at a top aperture of 1 mm (oversize - OS) and a bottom screen of 45 μm (SLIMES fraction).

The sand fraction containing the THM (-1 mm and +45 μm) was then dried and a sub-split of approximately 70-80 g is taken using a micro riffle splitter and used for heavy liquid separation using funnels and a heavy liquid, Tetrabromoethane (TBE), with a density of between 2.92 and 2.96 gcm^{-3} to determine total heavy mineral (THM) content. This sampling and sample analysis technique is considered appropriate and reliable based upon accepted industry practice. Diamantina Laboratories is considered to be an industry leading mineral sands assay laboratory.

QA/QC:

Accuracy monitoring was achieved through submission of certified reference materials (CRM's). HVY uses externally sourced CRM's inserted into sample batches at a rate of 1 in 40. The externally sourced, certified standard reference material for HM and Slimes assessment is provided by Placer Consulting. HVY also added field duplicate samples alternatively to CRM's at a rate of 1 in 40. Diamantina Laboratories conduct their own internal QA/QC checks and use internal CRM's at a rate of 1 in 40 and repeats at a rate of 1 in 40.

Examination of the QA/QC sample data indicates satisfactory performance of field sampling protocols and assay laboratories providing acceptable levels of precision and accuracy.

Geological Interpretation and Mineralogical Determination

THM sinks were logged by Diamantina Laboratories using rapid scan optical mineralogy techniques to identify the gross mineralogy breakdown. Estimates were rounded to the nearest 5%, in the exception of trace minerals which were determined to be 1%. This visual mineralogy estimation was then used to assist in the interpretation and domaining of the geology and for the development of mineral assemblage composites.

The geological interpretation was undertaken by IHC Mining in collaboration with the company's Non-Executive Technical Director and then validated using all logging and sampling data and observations. Current data spacing and quality is sufficient to indicate grade continuity with a moderate level of confidence.

Interpretation of modelling domains was restricted to the main mineralised envelopes utilising THM, SLIMES, oversize, mineralogy and geological logging. The interpretation of domains was also aided by the utilisation of lithological colour logging which assisted with distinguishing domain boundaries.

There is a moderate to high degree of confidence in the geological interpretation and of the enclosed mineralised envelopes. Grade trends have been used with cross-sectional data and variography analysis to define search ellipsoid orientation and size in controlling the grade interpolation and for populating the grade block model.

Four geological domains and a basement zone were identified and are used as constraints in the grade block model and for reporting the Mineral Resource Estimation.

There are two primary geological domains for the deposit, an upper near surface high THM grade domain (Zone 1) and a lower low THM grade domain (Zone 2) (refer to Figure 6).

There is also a smaller discontinuous geological domain located at the western extent of the deposit. Zone 3 is a very high THM grade domain located at depth along the western edge of the deposit exhibiting elevated garnet grades.

Figure 6: Section slices through the block model showing domains used for grade and mineralogical interpolation

A further 30 mineral assemblage composites were added to the previous total of 77 composites, taking the total number of mineral assemblage composites prepared for the Mineral Resource estimate to 107 composites. This has allowed the Company to ensure that there was enough data points to understand the variability of the mineralisation and mineralogy to ensure a moderate to high confidence in the Mineral Resource estimate. A coloured model image

(Figure 7) shows the assignment of the mineral assemblage composites to the block model. These sample numbers correspond to the mineralogy table for the QXRD results presented in Appendix 3.

Once the mineral assemblage composites were prepared (by splitting the THM sink samples down on a weighted basis), the samples were sent off to Bureau Veritas Minerals Pty Ltd in South Australia for whole rock XRF and QXRD analysis.

Figure 7: Block model coloured on assignment of mineral assemblage composites used for the mineralogy assignment

Estimation Methodology

Construction of the geological grade model was based on a combination of coding model cells in drill holes below open wireframe surfaces, including topography, mineralisation and basement and inside closed wireframes defined by the mineralised and non-mineralised domains.

The dominant drill grid spacing for the Port Gregory deposit was 250 m north-south and 100 m east-west.

A parent cell dimension of 50 m x 125 m x 1 m in XYZ was selected as this represents half the distance between drill holes spacing in the easting and northing directions for most of the model area and reflects the dominant down hole sample spacing.

The selected X and Y model origin coordinates are such that the model cell centroid is centred on the dominant drill hole X and Y coordinates (and given that the drill grid was regularly spaced, this was an effective method).

Inverse distance cubed (ID3) was used along with nearest neighbour to interpolate drill hole grades, logging codes and mineral assemblage composite identifiers into the block model. Kriging was also used to interpolate grades into the model as a check against the Inverse distance cubed interpolation method.

The kriging check against ID3 demonstrated that results of both methodologies were within <5% difference which is considered to be very satisfactory. This provides significantly more confidence in the grade interpolation of the model. It also shows a very firm understanding of the geological domaining and grade continuity of the deposit (especially for the Measured and Indicated classified material).

Part of the rationale for using both ID3 and kriging is centred around the continuity of the mineralisation (low nugget effect as determined from the experimental variograms), the drill hole and assay spacing (regular east-west and north-south) and the nature of sampling process.

Effectively there is an averaging over the length of the sample interval down hole (in this case being 1, 1.5 m and 2 m). There is already a dilution effect on any potential high grade mineralisation leading to inverse distance being a less complex and more straightforward methodology.

JORC Classification

The JORC classification was developed on the level of confidence of a number of criteria, namely:

- Support of the drilling spacing, both in the XYZ directions by variography;
- The number of mineral assemblage composites to establish clearly the distribution of mineralogy throughout the deposit;
- The continuity of the geology and consistency in the logging;
- The broad nature and relatively continuous grade of the mineralisation in a dunal-style deposit which makes up the majority of the project area; and
- The continuity and reproducibility of the THM, SLIMES and OS grades from twinned drilling and general QA/QC sampling.

About Heavy Minerals Limited

Heavy Minerals Limited (ASX: HVY) is an Australian ASX listed industrial mineral exploration company.

The Company's projects are prospective for industrial minerals including but not limited to garnet, zircon, rutile and ilmenite. The Company's initial focus is the Port Gregory and Red Hill Garnet Projects in Western Australia. Port Gregory comprises a total JORC (2012) Measured, Indicated and Inferred Mineral Resource of 166 million tonnes @ 4.0% THM. This includes 5.9 million tonnes of contained garnet and 220 thousand tonnes of ilmenite⁴.

An Exploration Target has been defined for Red Hill using cut-off grades for reporting of 3% THM and 1% THM and ranging from 90 to 150 Mt of material @ 5.4% to 4.1% THM. The Exploration Target also contains between 5 and 6 Mt of THM and 3.8 and 4.5 Mt of garnet⁵. The potential quality and grade of the Exploration Target is conceptual in nature and there has been insufficient exploration activity to determine a Mineral Resource estimate and it is uncertain if further exploration will result in the estimation of a Mineral Resource.

The Company's other project is the Inhambane Heavy Mineral Project in Mozambique which contains a ilmenite dominated JORC (2012) Inferred Mineral Resource of 90 million tonnes @ 3.0% Total Heavy Mineral⁶.

Competent Person Statement

The information in this announcement that relates to Mineral Resource estimates is based on and fairly represents information and supporting documentation prepared, compiled and reviewed by Mr. Greg Jones (FAusIMM) who is an Independent Non-Executive Director of the Company and is the Commercial and Business Development Manager for IHC Mining. Mr. Jones is a Fellow of the Australasian Institute of Mining and Metallurgy and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity that is being reported on to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr. Jones has reviewed this report and consents to the inclusion in the report of the matters in the form and context with which it appears.

Appendix 1: JORC Code Table 1

Section 1 Sampling Techniques and Data		
Criteria	Explanation	Comment
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> Aircore drilling was used to obtain samples for analysis at a mixture of 1, 1.5 and 2 m intervals Each sample was homogenized within the sample bag by rotating the sample bag A appropriate sample of sand, approx. 70 g (or the size of a matchbox), is scooped from the sample bag for an initial visual THM% estimation and logging. A similar sample mass is used for every pan sample for visual THM% estimation The standard sized sample is to ensure calibration is maintained for consistency in visual estimation A sample ledger is kept at the drill rig for recording sample numbers The aircore drill samples have an average range between 6 kg and 9 kg and were split down using a rig based rotary splitter to 1.5 to 2.5 kg. Samples were transported to Diamantina Laboratories for assaying. The laboratory sample was dried for up to 24 hours @ 105-110 degrees Celsius. The sample was then loosened until friable and passed through a rotary splitter to take a 250 g sub-sample. This sub-sample was then wet screened on a Sweco vibrating screen deck at a top aperture of 1 mm (oversize - OS) and a bottom screen of 45 µm (SLIMES fraction). The sand fraction containing the THM (-1 mm and +45 µm) is then dried and a sub-split of approximately 100 g is taken using a micro riffle splitter and used for heavy liquid separation using funnels and a heavy liquid, Tetrabromoethane (TBE), with a density of between 2.92 and 2.96 gcm⁻³ to determine total heavy mineral (THM) content.
Drilling techniques	<ul style="list-style-type: none"> Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<ul style="list-style-type: none"> Aircore drilling with inner tubes for sample return was used Aircore is considered a standard industry technique for HMS mineralisation. Aircore drilling is a form of reverse circulation drilling where the sample is collected at the face and returned inside the inner tube Aircore drill rods used were 3 m long NQ diameter (76mm) drill bits and rods were used All drill holes were vertically drilled

Criteria	Explanation	Comment																														
Drill sample recovery	<ul style="list-style-type: none">Method of recording and assessing core and chip sample recoveries and results assessed.Measures taken to maximise sample recovery and ensure representative nature of the samples.Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	<ul style="list-style-type: none">AC drill sample recovery is monitored by reviewing the sample mass of the total weight of the 1.0, 1.5 or 2.0 m interval weighed both on site as a wet sample and at the laboratory as a dried sampleIndustry leading mineral sand drilling specialists were engaged to drill the holes with experienced drillers to maximize drill recovery such as maintaining drill penetration rates, airflow and water injectionThe drilling and sampling used in the Mineral Resource estimate was dominantly completed by Bostech, with almost 90% - the remainder being split between Hornet Drilling and Terrain Drilling <table><tr><th>Drilling Phase</th><th>Drilling Company</th><th>Metres</th><th>%</th></tr><tr><td rowspan="3">1</td><td>BOSTECH</td><td>4428.00</td><td>41%</td></tr><tr><td>HORNET</td><td>626.60</td><td>6%</td></tr><tr><td>TERRAIN</td><td>593.90</td><td>5%</td></tr><tr><td colspan="2">Total</td><td>5648.50</td><td>52%</td></tr><tr><td>2</td><td>BOSTECH</td><td>5180.50</td><td>48%</td></tr><tr><td colspan="2">Total</td><td>5180.50</td><td>48%</td></tr><tr><td colspan="2">Grand Total</td><td>10829.00</td><td>100%</td></tr></table> <ul style="list-style-type: none">Bostech used a Drillboss 200 mounted on a 4WD truck, with compressor specifications of 600 CFM and 250 PSI mounted onboard the rigHornet used a Mantis 75 mounted on a 6WD Toyota Landcruiser, with compressor specifications of 160 CFM and 125 PSI mounted onboard the rigTerrain used a TD150 rig mounted on a MAN 4WD, with compressor specifications of 200-400 CFM and 160 PSI mounted onboard the rigAll drilling contractors used NQ sized drill rods with open face sampling bits appropriate for mineral sands drillingWhile initially collaring the hole, limited sample recovery can occur in the initial 0 m to 2 m sample interval owing to sample and air loss into the surrounding loose soilsThe initial 0 m to 2 m sample interval is drilled very slowly in order to achieve optimum sample recoveryThe entire sample passes through the on board rotary splitter and the sample collected in a pre-numbered calico bag. The bulk reject is not collected and is shovelled back down the hole upon completionAbout 5 samples are placed in numbered poly weave bags and secured with a cable tieAll samples were drilled in dry conditions, with no groundwater encountered. Water injection was used to keep dust down and maintain the integrity of the drill hole.At the end of each drill rod, the drill string is cleaned by blowing down with air/water to remove any clay and silt potentially built up in the sample hose	Drilling Phase	Drilling Company	Metres	%	1	BOSTECH	4428.00	41%	HORNET	626.60	6%	TERRAIN	593.90	5%	Total		5648.50	52%	2	BOSTECH	5180.50	48%	Total		5180.50	48%	Grand Total		10829.00	100%

Criteria	Explanation	Comment
		<ul style="list-style-type: none"> At the end of each hole the cyclone is inspected for material build up and cleanliness (for potential contamination) The twin-tube aircore drilling technique is known to provide high quality samples from the face of the drill hole
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> The aircore samples were each qualitatively logged using a field laptop (Toughbook) then entered into Field Marshall The aircore samples were logged for lithology, colour, grainsize, rounding, hardness, rock type, sorting, estimated THM%, estimated Slimes% and any relevant comments Every drill hole was logged in full with detailed logging based on a small sample of sand taken from the split sample to improve representivity Logging is undertaken with reference to a Drilling Guideline with codes prescribed and guidance on description to ensure consistent and systematic data collection
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> The AC drill sample collected at the source was split down to 1.5 to 2.5 kg using a rig based rotary splitter The sample size and process is considered an appropriate technique for mineral sands The sample sizes were deemed suitable to reliably capture THM, slime, and oversize characteristics, based on industry experience of the geologists involved and consultation with laboratory staff Field duplicates of the samples were completed at a frequency of 1 per 40 primary samples Standard Certified Reference Material samples are inserted into numbered sample bags in the field at a frequency of 1 per 40 samples. These are blind to the laboratory staff and laboratory processing flowsheet

Criteria	Explanation	Comment
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> The wet panning at the drill site provides an estimate of the THM and SLIMES grade which is expressed as a percentage and is sufficient for the purpose of determining approximate initial concentrations Individual aircore sub-samples (approximately 1.5 - 2.5 kg) were analysed by Diamantina Laboratories in Perth, Western Australia Diamantina Laboratories is considered to be a mineral sands industry leading laboratory The as received sample was dried for up to 24 hours @ 105-110 degrees Celsius. The sample was then loosened until friable and put over a rotary splitter to take a 250 g sub-sample. This sub-sample was then wet screened on a Sweco vibrating screen deck at a top aperture of 1 mm (oversize - OS) and a bottom screen of 45 µm (SLIMES fraction). The sand fraction containing the THM (-1 mm and +45 µm) is then dried and a sub-split of approximately 100 g is taken using a micro riffle splitter and used for heavy liquid separation using funnels and a heavy liquid, Tetrabromomethane (TBE), with a density of between 2.92 and 2.96 gcm⁻³ to determine total heavy mineral (THM) content. This is considered to be an industry standard technique Field duplicates and HM Standards are alternatively inserted into the sample string at a frequency of 1 per 40 primary samples Diamantina completed its own internal QA/QC checks that included laboratory repeats at a rate of 1 in 40 and the insertion of Standard Certified Reference Material at a rate of 1 in 40 prior to the results being released Analysis of QA/QC samples show the laboratory data to be of acceptable accuracy and precision. The adopted QA/QC protocols are acceptable and equal to accepted best industry practice
Verification of sampling and assaying	<ul style="list-style-type: none"> The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. 	<ul style="list-style-type: none"> All results are checked by the Competent Person The Competent Person makes periodic visits to the laboratory to observe sample processing A process of laboratory data validation using mass balance is undertaken to identify entry errors or questionable data Field and laboratory duplicate data pairs (THM / OS / SLIMES) of each batch are plotted to identify potential quality control issues Standard Certified Reference Material sample results are checked from each sample batch to ensure they are within tolerance (<2SD) and that there is no bias or drift

Criteria	Explanation	Comment
		<ul style="list-style-type: none"> The field and laboratory data has been updated into a Microsoft Access database and then imported into Datamine drill hole files. Data validation criteria are included to check for overlapping sample intervals, end of hole match between 'Lithology', 'Sample', 'Survey' files, duplicate sample numbers and other common errors No adjustments are made to the primary assay data
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> Down hole surveys for shallow vertical aircore holes are not required A handheld GPS was initially used to identify the positions of the drill holes in the field. The handheld GPS has an accuracy of +/- 5-10 m in the horizontal. A professional DGPS survey pickup of each collar position was completed upon completion of the drilling program LiDAR topography was used for modelling and location of all collar coordinates in RL. This level of topographic control is considered of high enough quality to take through the project development phases of PFS and DFS Following the completion of the drilling program, a professional survey pickup of all the drill hole collar coordinates was also undertaken The datum used is GDA94 and coordinates are projected as UTM zone 50
Data spacing and distribution	<ul style="list-style-type: none"> Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	<p>Aircore Drilling</p> <ul style="list-style-type: none"> The planned drill density was 100 m east-west by 250 m north-south Drilling completed to date consists of 358 AC holes spread across 18 parallel East/West orientated lines spaced 250 m apart in a North/South direction. Of these holes, a total of 325 were used in the Mineral Resource estimate preparation. Holes were omitted due to issues identified on site with sampling, holes collapsing and abandoned, and those holes strongly suspected sample contamination due to poor drilling technique. This was further pared down to 315 holes given there were 10 twinned holes drilled as part of the QA/QC This spacing is designed for supporting the development of Mineral Resource Estimation Each aircore drill sample is a single 1, 1.5 or 2 m sample of material intersected down the hole No compositing has been applied for values of THM, slime and oversize, other than the summary reporting of mineralisation intervals in this announcement Compositing of samples (107 composite samples) was undertaken on THM concentrates for mineral assemblage determination. The mineral assemblage

Criteria	Explanation	Comment
		<i>composite samples were determined by geological domains.</i>
<i>Orientation of data in relation to geological structure</i>	<ul style="list-style-type: none"> <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> 	<ul style="list-style-type: none"> <i>The aircore drilling section lines were oriented perpendicular to the strike of mineralisation</i> <i>The strike of the mineralisation is sub-parallel to the contemporary coastline and is interpreted to be controlled by limestone basement</i> <i>Drill holes were vertical because the nature of the mineralisation is relatively horizontal</i> <i>The orientation of the drilling is considered appropriate for testing the lateral and vertical extent of mineralisation limiting bias</i>
<i>Sample security</i>	<ul style="list-style-type: none"> <i>The measures are taken to ensure sample security.</i> 	<ul style="list-style-type: none"> <i>Aircore samples remained in the custody of Company representatives until they were trucked to Perth using an independent contractor or samples were transported by Company representatives</i> <i>The samples were transported to Perth and delivered directly to the laboratory along with a sample manifest for checking of samples</i> <i>The laboratory inspected the packages and did not report tampering of the samples</i>
<i>Audits or reviews</i>	<ul style="list-style-type: none"> <i>The results of any audits or reviews of sampling techniques and data.</i> 	<ul style="list-style-type: none"> <i>Internal reviews were undertaken and Richard Stockwell of Placer Consulting Pty Ltd was engaged to undertake supervision and training of onsite Company engaged contractors.</i>

Section 2 Reporting of Exploration Results

Criteria	Explanation	Comment
<i>Mineral tenement and land tenure status</i>	<ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<ul style="list-style-type: none"> <i>The completed drilling and Mineral Resource estimate lies within the granted exploration licences.</i> <i>The drill samples for this Mineral Resource estimate were taken from tenement E70/5160</i> <i>At the time of reporting all tenure was secure and any administrative costs or fees were fully paid up.</i>
<i>Exploration done by other parties</i>	<ul style="list-style-type: none"> <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<ul style="list-style-type: none"> <i>Previous tenement holders in the area, GMA, conducted Air Core drilling over the tenement.</i>
<i>Geology</i>	<ul style="list-style-type: none"> <i>Deposit type, geological setting and style of mineralisation.</i> 	<ul style="list-style-type: none"> <i>The deposit style is a combination of dunal and fluvial / marine sediments. Heavy mineral accumulations are preserved throughout the stratigraphic sequence.</i>

Criteria	Explanation	Comment
Drill hole Information	<ul style="list-style-type: none"> A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <ul style="list-style-type: none"> - easting and northing of the drill hole collar - elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar - dip and azimuth of the hole - down hole length and interception depth - hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Independent Geologist should clearly explain why this is the case. 	<ul style="list-style-type: none"> All significant drill results and drill hole collar locations have been identified in Appendices 2 and 3 respectively of this report. No relevant material data has been excluded from this report.
Data aggregation methods	<ul style="list-style-type: none"> In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> All length weighted intervals are reported for each hole in (Appendix 2) for grades above 2.0% THM For the Mineral Resource estimate reporting, the cut-off grade for reporting was THM > 2%.
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this 	<ul style="list-style-type: none"> All drill holes are vertical and perpendicular to the dip and strike of mineralisation and therefore all interceptions are approximately true thickness. Drill holes are inferred to intersect the mineralisation approximately perpendicularly. The deposit style is flat-lying and so the vertical holes are assumed to intersect the true width of any mineralisation.

Criteria	Explanation	Comment
	effect (eg 'down hole length, true width not known').	
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> Figures and plans are displayed in the main text of the Release
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> All drill results > 2.0% THM have been summarised as composited intervals and reported and tabulated in Appendix 2.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<ul style="list-style-type: none"> Samples have not yet been tested for in situ density. Passive seismic surveys have been carried out over the deposit in alignment with planned drilling. Preliminary results correlate to the identification of bands of limestone and calcrete in the drilling carried out to date. Detailed mineral assemblage work was undertaken on composite samples from across the resource area using whole rock XRF analysis and QXRD analysis by Bureau Veritas Minerals Pty Ltd, South Australia.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<ul style="list-style-type: none"> Pit-optimisation studies Bulk sample metallurgical testwork Test pit work to collect bulk samples and determine dig-ability indices Further work via infill and extension drilling to target high grade extensions, as well as mining inventory pit edge delineation is recommended. Refer to the main body of the release for further information regarding diagrams.

Section 3 Estimation and Reporting of Mineral Resources

Criteria	Explanation	Comment
Database integrity	<ul style="list-style-type: none"> Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection 	<ul style="list-style-type: none"> Exploration data provided by the company to IHC Mining in the form a Microsoft Excel Spreadsheet which was then imported into a Microsoft Access database.

Criteria	Explanation	Comment
	<p>and its use for Mineral Resource estimation purposes.</p> <ul style="list-style-type: none"> Data validation procedures used. 	<ul style="list-style-type: none"> Checks of data by visually inspecting on screen (to identify translation of samples), duplicate assays was visually examined to check the reproducibility of assays. Database assay values have been subjected to random reconciliation with laboratory certified value is to ensure agreement. Visual and statistical comparison was undertaken to check the validity of results.
Site visits	<ul style="list-style-type: none"> Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. 	<ul style="list-style-type: none"> Regular site trips before and during the resource drilling programme were undertaken by Mr Greg Jones to observe the drilling data collection, and sampling activities.
Geological interpretation	<ul style="list-style-type: none"> Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect, if any, of alternative interpretations on Mineral Resource. The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology. 	<ul style="list-style-type: none"> The geological interpretation was undertaken by IHC Mining in collaboration with the company and then validated using all logging and sampling data and observations. Current data spacing and quality is sufficient to indicate grade continuity. Interpretation of modelling domains was restricted to the main mineralised envelopes utilising THM, SLIMES, oversize, mineralogy and geological logging. The interpretation of domains was also aided by the utilisation lithological colour logging which assisted with distinguishing domain boundaries. Optical mineral scanning was undertaken on THM sink fractions by Diamantina Laboratories. This was a rapid scan and estimate process with rounding to the nearest 5% and 1% for trace mineral species. This scanned mineralogy was used to guide the domain interpretation and the design of the mineral assemblage composites. There is a high degree of confidence in the geological interpretation and of the enclosed mineralised envelopes. Grade trends have been used with cross-sectional data and variography analysis to define search ellipsoid orientation and size in populating the resource model. Four geological domains and a basement zone were identified and are used as constraints in the Mineral Resource Estimation. There are two primary geological domains for the deposit, an upper near surface high THM grade domain (Zone 1) and a lower low THM grade domain (Zone 2). There are also two smaller discontinuous geological domains located at the western and eastern extents of the deposit. Zone 3 is a very high THM grade domain

Criteria	Explanation	Comment
		<i>located at depth along the western edge of the deposit exhibiting elevated garnet grades.</i>
<i>Dimensions</i>	<ul style="list-style-type: none"> <i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource</i> 	<ul style="list-style-type: none"> <i>The Mineral Resource field for the Project is approximately 5 km in length (at the longest point) and approximately 3 km wide (at the widest point). Depth of the Mineral Resource typically ranges from 10 m to 60 m depth dictated by the morphology of the project region and limestone basement.</i>
<i>Estimation and modelling techniques</i>	<ul style="list-style-type: none"> <i>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i> <i>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i> <i>The assumptions made regarding recovery of by-products.</i> <i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i> <i>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</i> <i>Any assumptions behind modelling of selective mining units.</i> <i>Any assumptions about correlation between variables.</i> <i>Description of how the geological interpretation was used to control the resource estimates.</i> <i>Discussion of basis for using or not using grade cutting or capping.</i> <i>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</i> 	<ul style="list-style-type: none"> <i>The Mineral Resource estimate was conducted using Datamine Studio RM mining software. Inverse distance weighting techniques were used to interpolate assay grades from drill hole samples into the block model and nearest neighbour techniques were used to interpolate index values and nonnumeric sample identification into the block model. The mostly regular dimensions of the drill grid and the anisotropy of the drilling and sampling grid allowed for the use of inverse distance methodologies as no de-clustering of samples was required. Appropriate and industry standard search ellipses were used to search for data for the interpolation and suitable limitations on the number of samples and the impact of those samples was maintained. An inverse distance weighting power of 3 ('ID3') was used so as not to over smooth the grade interpolations. Ordinary Kriging was also used as check against the inverse distance weighting using THM grade as a comparison which proved successful demonstrating comparable results. Hard domain boundaries were used and these were defined by the geological wireframes that were interpreted.</i> <i>No assumptions were made during the resource estimation as to the recovery of by-products.</i> <i>SLIMES and oversize contents are estimated at the same time as estimating the THM grade.</i> <i>The average parent cell size used for the interpolation was half the standard drill hole width and half the standard drill hole section line spacing.</i> <i>No assumptions were made regarding the modelling of selective mining units however it is assumed that a form of dry mining will be undertaken, and the cell size and the sub cell splitting will allow for an appropriate dry mining preliminary reserve to be prepared. Any other mining methodology will be more than adequately catered for with the parent cell size that was selected for the modelling exercise.</i> <i>No assumptions were made about correlation between variables.</i> <i>The Mineral Resource estimates were controlled to an extent by the geological / mineralisation and basement surfaces.</i>

Criteria	Explanation	Comment
		<ul style="list-style-type: none"> Grade cutting or capping was not used during the interpolation because of the regular nature of sample spacing and the fact that samples were not clustered nor wide spaced to an extent where elevated samples could have a deleterious impact on the resource estimation. Sample distributions were reviewed and no extreme outliers were identified either high or low that necessitated any grade cutting or capping. The sample length of 1.0, 1.5 m and 2 m does result in a degree of grade smoothing also negating the requirement for grade cutting or capping. Validation of grade interpolations were done visually in Datamine Studio RM software by loading model and drill hole files and annotating and colouring and using filtering to check for the appropriateness of interpolations. Statistical distributions were prepared for model zones from drill hole and model files to compare the effectiveness of the interpolation. Along strike distributions of section line averages (swath plots) for drill holes and models were also prepared for comparison purposes.
Moisture	<ul style="list-style-type: none"> The basis of the adopted cut-off grade(s) or quality parameters applied. 	<ul style="list-style-type: none"> Cut-off grades for THM were used to prepare the reported resource estimates. These cut-off grades were defined by the Competent Person by considering the continuity of mineralisation at that cut-off-grade as well as the inflection points on the grade tonnage curves of the Port Gregory deposit. This was used to report the block model on material >2% THM for the Mineral Resource Consideration was taken into account for a modest stripping ratio to ensure that deeply buried material with a very low likelihood of eventual economic extraction was not selected for reporting in the Mineral Resource estimate. The selected cut-off grades are also in line with other deposits of similar size.
Mining factors or assumptions	<ul style="list-style-type: none"> Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported 	<ul style="list-style-type: none"> No specific mining method is assumed other than potentially the use of dry mining methods. It is assumed that dozer trap in combination with truck and excavator will be potential mining methods

Criteria	Explanation	Comment
	<i>with an explanation of the basis of the mining assumptions made.</i>	
Metallurgical factors or assumptions	<ul style="list-style-type: none"> The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made. 	<ul style="list-style-type: none"> Metallurgical assumptions were used based on mineral assemblage composites which at this stage only allow for preliminary commentary with no final products being defined from the reported mineral species.
Environmental factors or assumptions	<ul style="list-style-type: none"> Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. 	<ul style="list-style-type: none"> No assumptions have been made regarding possible waste and process residue however disposal of by products such as SLIMES, sand and oversize are normally part of capture and disposal back into the mining void for eventual rehabilitation. This also applies to mineral products recovered and waste products recovered from metallurgical processing of heavy mineral.
Bulk density	<ul style="list-style-type: none"> Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit. 	<ul style="list-style-type: none"> A bulk density algorithm was prepared using first principles techniques coupled with industry experience that is exclusive to IHC Mining. IHC Mining believe the bulk density formula to be conservative and fit for purpose at this level of confidence for the Mineral Resource estimates and based on our experience and we would also recommend that bulk density test work be undertaken going forward. A bulk density (BD) was applied to the model using a standard linear formula originally described by Baxter (1977). This approach was refined in a practical application by this author using the following first principles calculations to develop a regression formula. This regression formula was then used to calculate the

Criteria	Explanation	Comment
	<ul style="list-style-type: none"> Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. 	<p>conversion of tonnes from each cell volume and from there the calculation of material, THM and SLIMES tonnes.</p> <ul style="list-style-type: none"> The bulk density formula is described as: Bulk Density = (0.009 * HM) + 1.698
Classification	<ul style="list-style-type: none"> The basis for the classification of the Mineral Resources into varying confidence categories. Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data). Whether the result appropriately reflects the Competent Person's view of the deposit. 	<ul style="list-style-type: none"> The resource classification for the Port Gregory deposit was based on the following criteria: drill hole spacing, geological and grade continuity, variography of primary assay grades and the distribution of bulk samples. The classification of the Measured, Indicated and Inferred Mineral Resources was supported by all the supporting criteria as noted above. As a Competent Person, Greg Jones considers that the result appropriately reflects a reasonable view of the deposit categorisation.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of Mineral Resource estimates. 	<ul style="list-style-type: none"> No audits or reviews of the mineral resource estimate have been undertaken at this point in time.
Discussion of relative accuracy/ confidence	<ul style="list-style-type: none"> Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. 	<ul style="list-style-type: none"> Variography was undertaken to determine drill hole support of the selected JORC Classification Ordinary Kriging was used as a check against the inverse distance weighting technique for the interpolation of THM grade demonstrating a strong correlation providing further confidence in the resource estimate Validation of the model vs drill hole grades by observation and comparison on screen Swathe plots, trend plots in both X and Y used to validate model vs drill hole grades Contact analysis used to validate the model's geological domains The statement refers to global estimates for the entire known extent of the Port Gregory deposit. No production data is available for comparison with the Port Gregory deposit.

Appendix 2: Summary of drill hole results
