WINSOME RESOURCES

ASX: WR1 | FSE: 4XJ | OTCQB: WRSLF

ASX RELEASE | 1 August 2023

Substantial high-grade intersections continue to grow Adina

HIGHLIGHTS

- Assays have been received from "step-out" drilling to the east and west of previous drilling at Adina Main, with results now available from regular spaced drilling of over 1km of the 3.1km of known mineralisation at Adina.
- Substantial, high grade lithium mineralisation continues to be intersected in both Main Zone and Footwall Zone. Results detailed in Table 1 and include:
  - 1.37% Li_2O over 61.2m from 8.9m (AD-23-024, Main Zone),
  - 1.98% Li_2O over 35.4m from 251.2m (AD-23-021, FW Zone)
  - 1.62% Li_2O over 20.4m from 345.2m (AD-23-023, FW Zone)
  - 1.59% Li_2O over 27.6m from 32.4m (AD-23-024A, Main Zone),
  - 1.24% Li_2O over 33.3m from 227.3m (AD-23-024A, FW Zone),
  - 1.35% Li_2O over 30.8m from 67.5m (AD-23-075, Main Zone),
  - 2.18% Li_2O over 24.1m from 268.5m (AD-23-075, FW Zone),
  - 1.62% Li_2O over 14.0m from 194m (AD-23-99, FW Zone).
- Mineralised intersections continue to include discrete ultra-high grade zones, with the above intersections containing zones such as:
  - 2.14% Li_2O over 7.0m from 29.0m & 2.60% Li_2O over 8.1m from 62.0m (AD-23-024, Main Zone),
  - 1.97% Li_2O over 16.6m from 32.4m (AD-23-024A, Main Zone), and
  - 2.66% Li_2O over 10.3m from 88.0m (AD-23-075, Main Zone).
- Assays still awaited from near surface drill testing of Footwall Zone.
- Drilling rigs mobilising to site this week following lifting of restrictions, next phase focussing on higher grade zones to inform maiden Mineral Resource.

Lithium exploration and development company Winsome Resources (ASX:WR1; "**Winsome**" or "**the Company**") is pleased to provide an update on exploration at its 100% owned Adina project in the James Bay region of Quebec, Canada. Further thick, high-grade results have been received from both the Main Zone and Footwall Zone, summarised in Table 1 and 2, increasing the strike length of the core Adina Main Deposit. Drill rigs are currently mobilising back to Adina to re-commence the 2023 drill programme.

WINSOME'S MANAGING DIRECTOR CHRIS EVANS SAID:

"Adina continues to grow in size with each set of drilling results as does its potential to be a significant near term supplier to the North American lithium market. We are focussed on defining a robust lithium resource with systematic drill testing of the pegmatite bodies identified to date, as well as testing for new pegmatite swarms similar to the recent Footwall Zone discovery.

We are very pleased and relieved to be back on site at Adina following the recent fires in Quebec. We consider ourselves fortunate to have escaped without significant damage to our property and our thoughts are with those that have suffered damage in this fire event. We also appreciate the assistance provided by the various emergency services to the communities. I would also like to personally thank RJLL for their support in re-commencing operations and look forward to the drills turning shortly."

Hole	***Intercepts***	***Setting***
AD-23-021	1.98% Li_2O over 35.4m from 251.2m to 286.6m	East

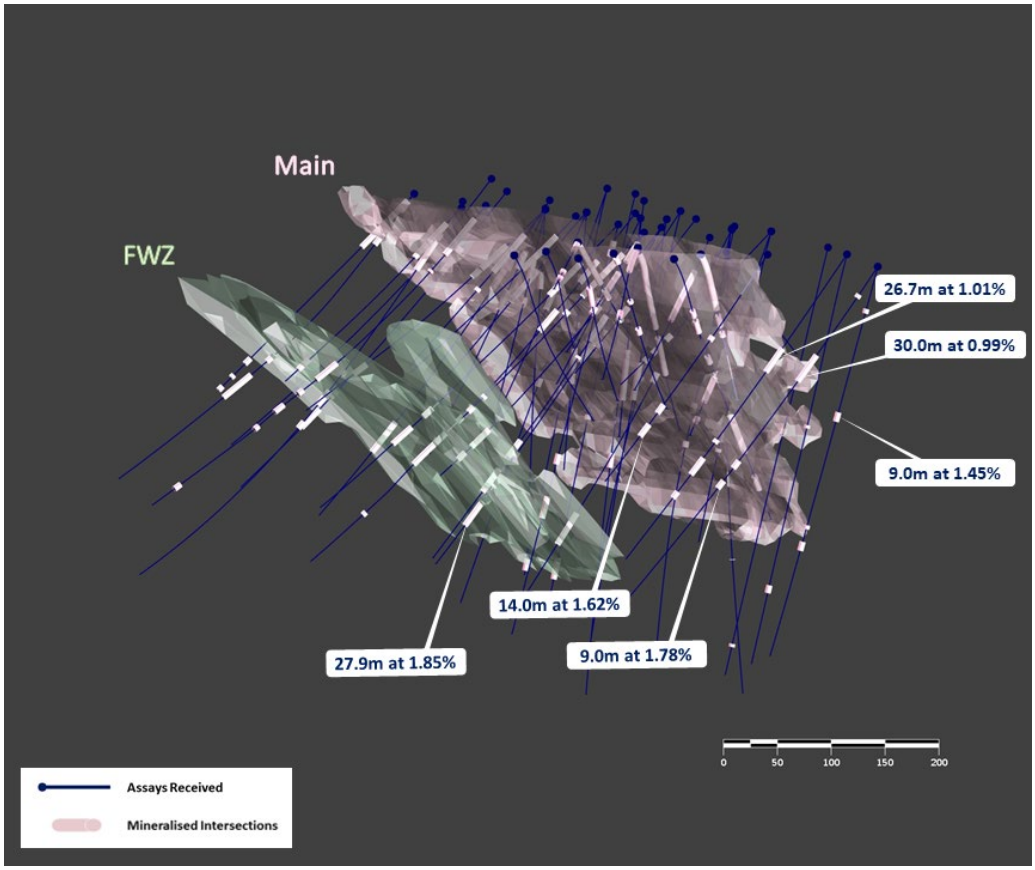

Figure 3: Adina Drill Results (West) – Oblique view looking to east along conceptual pegmatite models.

Commentary on Drilling Results

Intersections reported in this announcement confirm the continuity of lithium mineralisation to the east and west of Adina Main. With the receipt of these results drilling has now defined lithium mineralisation at Adina at close spacing over a strike length of 1km, representing the core of the 3.1km of mineralisation defined by drilling at Adina[1]. Drilling stepped out some 250m to the east and a further 150m to the west, systematically testing mineralisation on a spacing of approximately 100m x 100m. Mineralisation remains open to the east and west of drilling.

All drillholes tested both the Main Zone and the recently discovered Footwall Zone, with thick, high-grade intersections received from both zones as detailed in Tables 1 and 2 above. New results received are shown on Figures 1 and 2 with all data from the programme to date included in the Appendices. A total of 76 holes had been completed for 22,500 metres at the time drilling was suspended. Assays have now been received for 62 of these drillholes.

Results are still pending from holes drilled to test the up-dip extension of the Footwall Zone, closer to surface (Figure 3). Forthcoming drilling will focus on testing extensions to higher grade mineralisation in both the Main and Footwall Zones, to ensure these zones are well defined prior to resource modelling later in 2023.

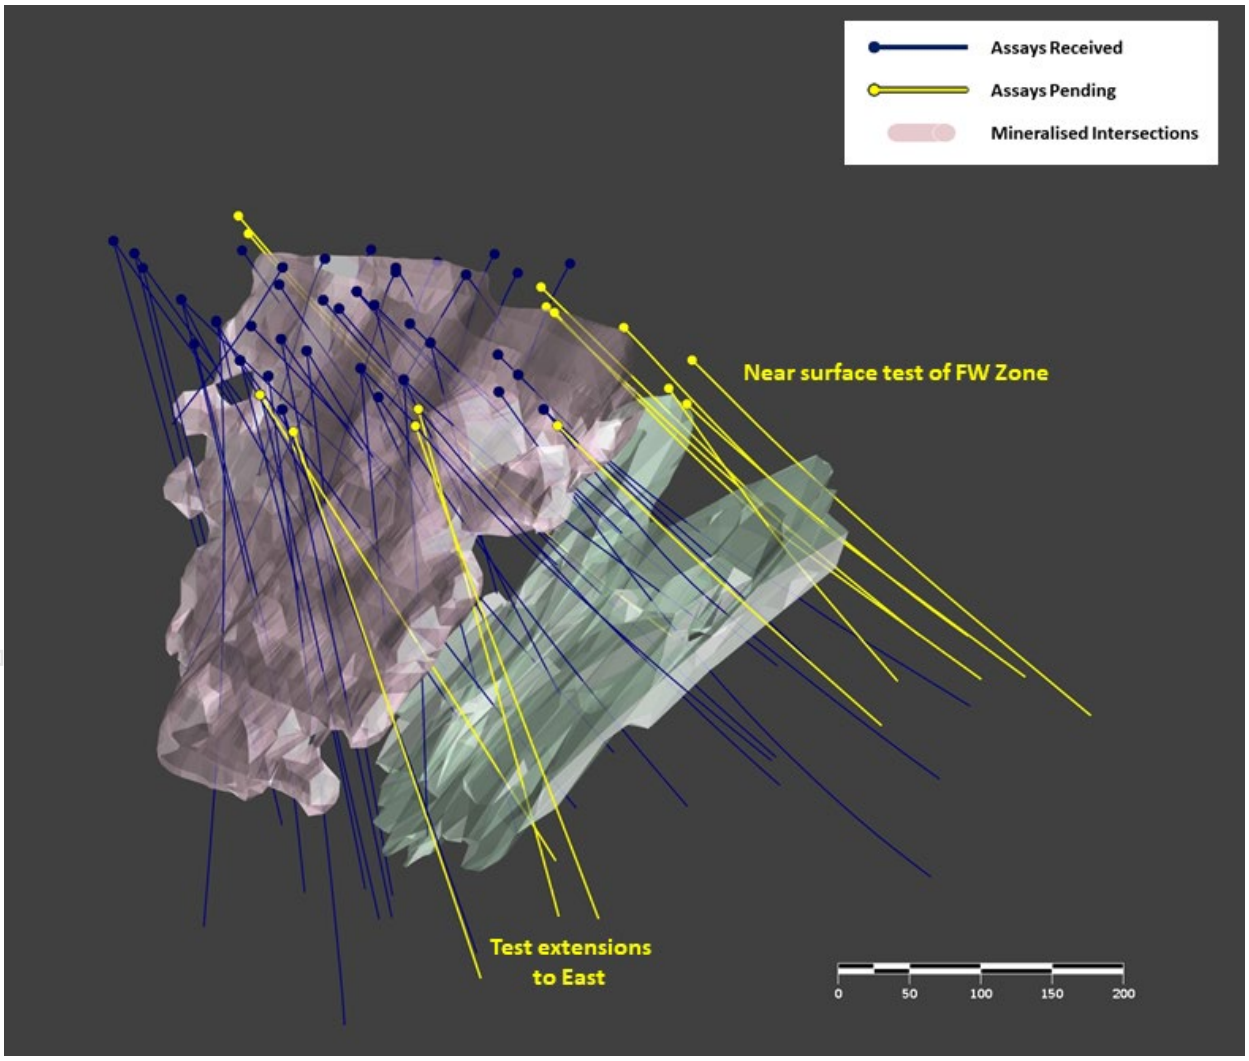

Figure 3: Oblique view looking west of drilling to date at Adina Main showing conceptual pegmatite models and drillholes where assays are pending

[1] *"Over 3km of lithium mineralisation confirmed at Adina"* ASX Announcement 3 April 2023

Commentary on Operations in Quebec

The Company is pleased to advise that its team have returned to Cargair Camp over the last few days following the lifting of restrictions in the James Bay region. Inspection of the area has confirmed the initial assessment that the Company's assets have not been affected by the fire. As previously advised, there was some fire damage to drilling and ancillary equipment owned by the Company's drilling contractor RJLL but access is expected to be re-established in coming days to all active drilling sites. RJLL is mobilising drilling rigs to site to enable operations to re-commence over the coming week.

The Company acknowledges the efforts of RJLL to assist in the rapid re-start of drilling at Adina as well as being supportive of all those affected by recent fires in the region.

Drilling will focus on following up higher grade results received from the programme to date to ensure that high grade zones are well defined ahead of resource modelling scheduled for the later part of 2023. While there remain several high priority exploration targets within the Adina Project, drilling will be prioritised between new targets and ensuring adequate data density over a significant proportion of the 3.1km of mineralisation defined by drilling at Adina to date.

This announcement is authorised for release by the Board of Winsome Resources Limited.

ABOUT WINSOME RESOURCES

Winsome Resources (ASX: WR1) is a Perth-based, lithium focused exploration and development company with six project areas in Quebec, Canada. Four of Winsome's projects – Cancet, Adina Sirmac-Clappier and Tilly are 100% owned by the Company. The Company also has exclusive option agreements to acquire and explore 669 claims totalling 385km^2 in Decelles and a further 259 claims totalling 149km^2 at Mazerac, located near the Quebec mining town of Val-d'Ór. Recently the Company acquired a further 47km^2 of claims at the Tilly Project, located near Adina, and an option over the 29 claims of the Jackpot Property, immediately north of Adina.

The most advanced of Winsome's projects - Cancet and Adina, provide shallow, high grade lithium deposits and are strategically located close to established infrastructure and supply chains.

In addition to its impressive portfolio of lithium projects in Quebec, Winsome Resources owns 100% of the offtake rights for lithium, cesium and tantalum from Power Metals Corp (TSXV:PWM) Case Lake Project in Eastern Ontario, as well as a 10% equity stake in PWM.

Winsome is led by a highly qualified team with strong experience in lithium exploration and development as well as leading ASX listed companies.

CAUTION REGARDING FORWARD-LOOKING INFORMATION

This document contains forward-looking statements concerning Winsome. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward-looking statements as a result of a variety of risks, uncertainties and other factors. Forward-looking statements are inherently subject to business, economic, competitive, political and social uncertainties and contingencies. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information provided by the Company, or on behalf of, the Company. Such factors include, among other things, risks relating to additional funding requirements, metal prices, exploration, development and operating risks, competition, production risks, regulatory, including environmental regulation and liability and potential title disputes.

Forward-looking statements in this document are based on the Company's beliefs, opinions and estimates of Winsome as of the dates the forward-looking statements are made, and no obligation is assumed to update forward-looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

COMPETENT PERSON'S STATEMENT

The information in this report which relates to Exploration Results is based on, and fairly represents, information and supporting documentation prepared by Mr Antoine Fourier, VP Exploration of Winsome Resources Ltd. Mr Fourier is a member of the Quebec Order of Geologists (OGQ #0516), a Registered Overseas Professional Organisation as defined in the ASX Listing Rules, and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which has been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves".

Mr Fourier consents to the inclusion in this release of the matters based on the information in the form and context in which they appear.

[1] Assays previously reported. *"Strong lithium mineralisation recorded from first Adina drill hole assays"* ASX Announcement 6 January 2023

[2] Assays previously reported. *"New assay results confirm strong lithium mineralisation at Adina"* ASX Announcement 14 February 2023

[3] Assays previously reported. *"Assays confirm Adina as a robust, high-grade lithium project"* ASX Announcement 23 March 2023

[4] Assays previously reported. *"Over 3km of lithium mineralisation confirmed at Adina"* ASX Announcement 3 April 2023

[5] Assays previously reported. *"New Lithium Bearing Pegmatite Dyke Swarm at Adina"* ASX Announcement 10 May 2023

[6] Assays previously reported. *"New results confirm multiple zones and continuation of lithium mineralisation at Adina"* ASX Announcement 13 June 2023

Appendix 3: Diamond Drilling Summary for Winsome's drilling program at Adina.

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	***Explanation***
Sampling techniques	• All core is NQ (76mm) in this program. Core sample intervals were geologically logged, measured for average length, photographed, and placed into numbered core trays. • RC drilling utilised face sampling hammers with samples split down to a 2kg sample size. • Samples from Adina were sent to SGS Minerals Geochemistry under standard preparation procedures. • Gravity data obtained by ground measurements at regular intervals.
Drilling techniques	• NQ diamond drilling was completed at Adina. • Oriented core drilling was not completed. Downhole surveying was conducted using a gyro-based system.
Drill sample recovery	• The recovery of the diamond drilling samples was reported by the operators and supervised by our consulting geologist. • No sample bias has been established.
Logging	• NQ core was logged and cut according to geological boundaries, with ~1 m intervals targeted for individual samples. • For RC and DD drilling features such as rock type, modal mineralogy, rock textures, alteration were recorded. Geological logging information was recorded directly onto the GeoticLog system and compiled onto Database platform, with weekly backups. • The core is stored in the Geological consultants (Technominex) yard in Rouyn-Noranda which is a secure location. • Various qualitative and quantitative logs were completed. All core has been photographed. • The logging database contains lithological data for all intervals in all holes in the database.
Sub-sampling techniques and sample preparation	• Adina drill core was split (sawn) at the Winsome core logging and cutting facility located at the project base in James Bay, with half core samples intervals submitted to SGS preparation facilities in Val-d'Or, Quebec. • Half core NQ samples are believed to be representative of the mineralisation targeted. Sampling intervals are based on geological boundaries to aid representivity. • Samples are crushed, milled and split at the laboratory (SGS) to achieve a 250g sub-sample for assay. Laboratory QC procedures for sample preparation include quality control on checks crushing and milling to ensure representivity.

Criteria	*Explanation*
Quality control & Quality of assay data and laboratory tests	• Assay and laboratory procedures have been selected following a review of techniques provided by laboratories in Canada. SGS and AGAT are both internationally certified independent service providers. Industry standard assay quality control techniques were used for lithium related elements. • Samples are submitted for multi-element ICP analysis by SGS or AGAT Laboratories which is an appropriate technique for high-grade lithium analysis. • Sodium Peroxide Fusion is used followed by combined ICP-AES and ICP-MS analyses (56 elements). Li is reported by the lab and converted to Li_2O for reporting using a factor of 2.153. • No handheld instruments were used for analysis. • Comparison of results with standards indicate sufficient quality in data. No external laboratory checks have been used but are planned to be completed shortly. • Different grades of certified reference material (CRM) for lithium mineralisation were inserted, as well as field duplicates, and blanks. The CRM's submitted represented a weakly mineralised pegmatite (OREAS 750), and a moderate lithium mineralised pegmatite (AMIS 0341) to high grade lithium mineralised pegmatite (OREAS 752 & 753). Quality Assurance and Quality Control utilised standard industry practice, using prepared standards, field blanks (approximately 0.4 kg), duplicates sampled in the field and pulp duplicates at the lab. • Blank samples were submitted at a rate of approximately 5%, same for duplicates and repeat assay determinations, whereas standards were submitted at a rate of approximately 20%.
Verification of sampling and assaying	• Significant intersections have been estimated by consultants to the company and cross checked. • Hard copy field logs are entered into and validated on an electronic database , which is maintained by Winsome on site in James Bay and backed up regularly by the Company's IT consultants in Val D'Or. • Data verification is carried out by the Project Geologist on site, and a final verification was performed by the Senior Geologist and the geologist responsible for database management. An independent verification is carried out by consultants to the company. • No assays have been adjusted. A factor of 2.153 has been applied to the reported Li assays by the laboratory so to report as Li_2O.
Location of data points	• The drill holes have been reported as being located by hand-held GPS. Historical drill holes have been verified by GPS. • The grid datum is NAD83. Zone 18N. • Topographic elevation and landmarks are readily visible from a Digital Elevation Model with a 50cm grid resolution and orthophoto obtained from Lidar surveys performed in 2017 and 2022 over the property. Government topographic maps have been used for topographic

Criteria	*Explanation*
	validation. The GPS is otherwise considered sufficiently accurate for elevation data. • Down hole dip surveys were taken at approximately 30m intervals and at the bottom of the diamond drill holes.
Data spacing and distribution	• In this early delineation stage, drilling is largely set along sections at 100m spacing and aiming to intercept targeted horizon at 80-100m centres. • No assessment has been made regarding the current drill hole location and intersections with respect to resources or reserve estimation. • No sample compositing has been completed. However, internal dilution of non-mineralised material into calculated grade over widths reported herein may occur but is not considerable.
Orientation of data in relation to geological structure	• Drilling is designed to confirm the historical drilling results and test potential mineralisation. They were oriented sub-perpendicular to the potential mineralised trend and stratigraphic contacts as determined by field data and cross section interpretation. Intersection widths will therefore be longer than true widths. • No significant sample bias has been identified from drilling due to the optimum drill orientation described above. Where present, sample bias will be reported.
Sample security	• The company takes full responsibility on the custody of the samples including the sampling process itself and transportation. • Samples are shipped during the weekly supply run and delivered directly to the respective laboratories.
Audits or reviews	• No external audit of the database has been completed, apart from by consulting geologists acting on behalf of the company.

Section 2 Reporting of Exploration Results

(Criteria in the preceding section also apply to this section.)

Criteria	*Explanation*
Mineral tenement and land tenure status	• The Winsome Adina Lithium Project is 100% owned by Winsome Adina Lithium Inc. • All tenements are in good standing and have been legally validated by a Quebec lawyer specialising in the field.
Exploration done by other parties	• Initial Exploration and Review was undertaken by MetalsTech Limited. • Government mapping records multiple lithium bearing pegmatites within the project areas with only regional data available.
Geology	• The mineralisation encountered at the Adina project is typical of a Lithium-Caesium-Tantalum (LCT) type of pegmatite. The pegmatite body is oriented sub-parallel to the general strike of the host rocks. The host rocks are composed of Archean Lac Guyer greenstone rocks, which include mafic and ultramafic rocks interlayered with horizons of metasedimentary and felsic volcanic rocks

Drill hole Information	• For the current drill program, the following information has been included for all holes reported:
	  • easting and northing of the drill hole collar
	  • elevation or RL (reduced level – elevation above sea level in metres) of the drill hole collar
	  • dip and azimuth of the hole
	  • down hole length and interception level
	  • hole length
	• A summary of historical drill hole information was included in the Independent Geologists Report prepared by Mining Insights within the Company's prospectus

Data aggregation methods	• No sample weighting or metal equivalent values have been used in reporting. • Aggregation issues are not considered material at this stage of project definition. No metal equivalent values were used
Relationship between mineralisation widths and intercept lengths	• The pierce angle of the drilling varies from hole to hole, in order to attempt, wherever possible, to represent true widths
Diagrams	• See figures and maps provided in the text of the announcement.
Balanced reporting	• Winsome Resources Ltd will endeavour to produce balanced reports accurately detailing all results from any exploration activities. • All drillholes and intersections have been presented in this announcement and in previous announcements.

Criteria	*Explanation*
Other substantive exploration data	• All substantive exploration data has been included in ASX Announcements. No other substantive exploration data is available at this time.
Further work	• Winsome Resources Ltd continues to complete further site investigations. • Further work planned includes comprehensive data interpretation, field mapping and exploration drilling.
