

6 November 2023

New Pilbara Lithium Samples Reinforce Turner River Prospectivity with Assays up to 3.8% LiO₂

- Pegmatites in a new area of interest at Turner River have been sampled with assays up to 3.8% LiO₂, 3.4% LiO₂ and 1.3%Rb₂O in the heart of the Pilbara region of Western Australia which continues to reveal new discoveries.
- Extensive trenching and detailed sampling and mapping planned.
- Detailed airborne geophysics over the Turner River Project has been completed and is being assessed by QXR's specialist consulting team. It will be merged with district scale geophysics and detailed spectral image analysis to better define mineralised extensions and drilling targets.

QX Resources Limited (ASX: QXR, 'QXR' or the 'Company') confirms further rockchip sample results with up to 3.8% LiO₂ and 1.3%Rb₂O at Turner River in the heart of the Pilbara lithium province of Western Australia.

These new samples are taken from a new areas of interest within Turner River are located some ~250m from where the first samples were reported last year which include ~10kg 'wheelbarrow-sized' samples grading 4.9% LiO₂ (see Figure 2 below).

With an expanded zone of interest, QXR will reinforce its focus on Turner River with detailed trenching and sampling, once the recently flown airborne geophysics data is assessed, to target new areas and mineralised extensions under shallow cover to better define drilling targets. The airborne geophysics report will be released shortly.

The key target is the contact zone between greenstones and granitoids known to be permissive for lithium mineralisation of the Split Rock Supersuite with which the Wodgina, Pilgangoora and Global Lithium deposits are associated. QXR owns 100% of four large project areas in the Pilbara - Split Rock (E46/1367), Western Shaw (E45/6107, E45/4960), Turner River and Yule River leases (E45/6159) (see Figure 4).

QX Resources Managing Director, Steve Promnitz, said: "High grade lithium results continue to drive the need for a much more structured and comprehensive exploration program at Turner River. The fact that we continue to identify high grade samples over a broader area is very positive and warrants immediate follow up. These are some of the highest grade samples of lithium recorded in the Pilbara and it has reinforced our confidence in this project. With the airborne geophysics, a number of targets will be defined for further sampling and trenching under shallow cover, leading to drill targets. Recent results by other companies reaffirm the Pilbara as the prime location globally for major lithium hard rock discoveries and QXR hold favourable ground in the heart of the Pilbara."

About QX Resources

QX Resources (ASX:QXR) is focused on exploration and development of battery minerals, with hard rock lithium assets in a prime location of Western Australia (WA), and gold assets in Queensland. The aim is to connect end users (battery, cathode and car makers) with QXR, an experienced explorer/developer of battery minerals, with an expanding mineral exploration project portfolio and solid financial support.

Lithium hard rock portfolio: QXR's lithium strategy is centred around WA's prolific Pilbara province, where it has four projects in strategic proximity to some of Australia's largest lithium deposits and mines. Across the Pilbara, QXR's regional lithium tenement package (both granted or under application) spans more than 350 km².

Lithium brine: QXR is continuing due diligence under an exclusive Letter of Intent over a large recently consolidated lithium brine project in California, USA

Gold portfolio: QXR is also developing two Central Queensland gold projects through an earn-in agreement with Zamia Resources Pty Ltd. Both gold projects are strategically located within the Drummond Basin, a region that has a >6.5moz gold endowment.

Nickel sulphides: QXR has a significant investment in unlisted public Australian company Bayrock Resources Limited, which has a portfolio of highly prospective battery minerals assets in Sweden, primarily in nickel, cobalt and copper. QXR is assisting Bayrock with project development and financing initiatives

Competent Persons Statement

The information in this report that relates to Exploration Results and Exploration Targets is based on information compiled by Mr. Roger Jackson, a Director and Shareholder of the Company, who is a 25+ year Fellow of the Australasian Institute of Mining and Metallurgy (MAusIMM), Fellow of the Australian Institute of Geoscientists and a Member of Australian Institute of Company Directors. Mr. Jackson has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration results, Mineral Resources and Ore Reserves". Mr. Jackson consents to the inclusion of the data contained in relevant resource reports used for this announcement as well as the matters, form and context in which the relevant data appears.

Cautionary Statement

The Company notes that pegmatites contain varying abundances of typical LCT pegmatite non-Li-bearing minerals, predominantly feldspar, quartz, muscovite mica (as a group also referred to as Alpite) and accessory tourmaline. Investors should note that while LCT pegmatites are a known host for accessory lithium bearing minerals such as spodumene, it is also known that this is not a universal association. At this stage it is too early for the Company to make a determinative view on the abundances of any of these minerals. The observed presence of pegmatite does not necessarily equate to lithium mineralisation.

Forward Looking Statements and Important Notice

This report contains forecasts, projections and forward-looking information. Although the Company believes that its expectations, estimates and forecast outcomes are based on reasonable assumptions it can give no assurance that these will be achieved. Expectations and estimates and projections and information provided by the Company are not a guarantee of future performance and involve unknown risks and uncertainties, many of which are out of QX Resources' control. Actual results and developments will almost certainly differ materially from those expressed or implied. QX Resources has not audited or investigated the accuracy or completeness of the information, statements and opinions contained in this announcement. To the maximum extent permitted by applicable laws, QX Resources makes no representation and can give no assurance, guarantee or warranty, express or implied, as to, and takes no responsibility and assumes no liability for the authenticity, validity, accuracy, suitability or completeness of, or any errors in or omission from, any information, statement or opinion contained in this report and without prejudice, to the generality of the foregoing, the achievement or accuracy of any forecasts, projections or other forward looking information contained or referred to in this report. Investors should make and rely upon their own enquiries before deciding to acquire or deal in the Company's securities.

Appendix A: JORC Code, 2012 Edition – Table 1 - Rock Sampling

August-Oct 2023 - QX Resources Pilbara Projects

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralization that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralization types (eg submarine nodules) may warrant disclosure of detailed information. 	<ul style="list-style-type: none"> The QX Resources Ltd. (QXR) samples were collected opportunistically from outcrop. Sampling was selected based on host rock potential within the indicative target mineralogy. Samples averaged 0.5 kg in weight. All sample information, including lithological descriptions and GPS coordinates were recorded at each sample location. The rock samples will be shipped to an accredited laboratory in Perth, WA, for analysis.
Drilling techniques	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable. No drilling being reported
Drill sample recovery	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable. No drilling being reported
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	<ul style="list-style-type: none"> The QXR rock samples and sample locations were qualitatively logged and registered by geologists from APEX Geoscience, a third party geological consulting firm based in Fremantle, WA.
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<ul style="list-style-type: none"> The rock samples were collected between 0.5-1 kg and were of sufficient size to represent the outcrop area of interest. The sample sizes and analysis size are considered appropriate to correctly represent the mineralization based on: the style of mineralization, the sampling methodology and assay value ranges for the commodities of interest. Samples were initially tested with the portable XRF instrument before and will be submitted to an accredited laboratory, ALS in Perth, WA, for analysis. The sample sizes and analysis size are considered appropriate to correctly represent the mineralisation based on the style of mineralisation, sampling methodology and assay

Criteria	JORC Code explanation	Commentary
		value ranges for the commodities of interest.
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<ul style="list-style-type: none"> The samples were submitted to an accredited laboratory, ALS in Perth, WA, for analysis. Standards or blanks were inserted by ALS, the accredited laboratory together with their own quality control standards at set frequencies to monitor the precision of the analyses.
Verification of sampling and assaying	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable.
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<ul style="list-style-type: none"> Rock sample points were determined using a handheld Garmin GPS, considered to be accurate to ± 5 m. All coordinates were recorded in MGA Zone 50 datum GDA94.
Data spacing and distribution	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable due to the reconnaissance nature of the sampling.
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable due to the reconnaissance nature of the sampling.
Sample security	<ul style="list-style-type: none"> The measures taken to ensure sample security. 	<ul style="list-style-type: none"> The sample security consisted of the rock chips being collected from the field into calico bags and loaded into polyweave bags for transport to the Toll transport depot. Toll delivered the samples to their depot in Perth, WA. APEX Geoscience personnel personally delivered the samples to the ALS laboratory upon arrival Perth. The sample submission was submitted by email to the lab, where the sample counts and numbers were checked by laboratory staff.
Audits or reviews	<ul style="list-style-type: none"> The results of any audits or reviews of sampling techniques and data. 	<ul style="list-style-type: none"> No formal audits or reviews have been performed on the project, to date. The rock chip work was carried out using industry acceptable pXRF device and samples were submitted to reputable laboratories using industry best practice.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	<ul style="list-style-type: none"> The QXR Pilbara Projects include tenements E 45/6065 and E 45/6042 (Turner River), E 45/4960 (Western Shaw) and E 46/1367 (Split Rock). Tenement E 45/4960 is held under the name of Redstone Metals Pty Ltd under an agreement with QXR and was granted on 07/05/2019 for a period of 5 years. It is in good standing.
Exploration done by other parties	<ul style="list-style-type: none"> Acknowledgment and appraisal of exploration by other parties. 	<ul style="list-style-type: none"> Australian Anglo American Ltd, (1970's), Mt Newman Mining Co,(1980 to 1990), Atlas Iron (2007 to 2011) FMG, previously held the tenement; tested for Au, Fe, Cu, Pb, Zn.
Geology	<ul style="list-style-type: none"> Deposit type, geological setting and style of mineralization. 	<ul style="list-style-type: none"> The Western Shaw Project covers part of the Western Shaw. The greenstone belt comprises tightly folded bif/bch, basalts, ultramafics and felsic schist. QXR is targeting lithium-caesium-tantalum LCT pegmatite mineralisation associated with a greenstone belt and granitoids
Drill hole Information	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable. No drilling being reported
Data aggregation methods	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable. No drilling being reported
Relationship between mineralization widths and intercept lengths	<ul style="list-style-type: none"> 	<ul style="list-style-type: none"> Not applicable. No drilling being reported
Diagrams	<ul style="list-style-type: none"> Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<ul style="list-style-type: none"> An appropriate exploration map has been included in the release showing the location of the rock chip samples.
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<ul style="list-style-type: none"> A table showing rock chip sample locations has been included in the release.
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical, rock characteristics 	<ul style="list-style-type: none"> Rock chip sample locations have been included in the release.
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas. 	<ul style="list-style-type: none"> Future work entails follow up sampling and trenching, prior to drill testing. This will be augmented by the results of an assessment of recently collected airborne geophysical data.
