WINSOME RESOURCES

ASX: WR1 | FSE: 4XJ | OTCQB: WRSLF

ASX RELEASE | 27 November 2023

Adina Main strike length extended by 300m to over 1,300m

HIGHLIGHTS

- Lithium mineralisation has been extended by 300m east at Adina between the Main and Far East Zones
- Strike length of mineralisation at Adina Main Zone defined by systematic drilling now increased to over 1,300m
- Recent results from the Main zone are detailed below and include:
  - 1.24% Li_2O over 13.6m from 20m below surface (Main, AD-23-014),
  - 1.52% Li_2O over 12.1m from 90m below surface (Main, AD-23-076),
  - 1.63% Li_2O over 9.0m from 10m below surface (Main, AD-23-076),
  - 1.23% Li_2O over 8.3m from 5m below surface (Main, AD-23-016)
- Up dip drill testing of Footwall Zone to the north also confirms mineralisation closer to surface.
  - 1.42% Li_2O over 18.0m from 280m below surface (FWZ, AD-23-074),
  - 1.04% Li_2O over 18.3m from 135m below surface (FWZ, AD-23-012),
  - 1.23% Li_2O over 11.4m from 195m below surface and 1.14% Li_2O over 11.3m from 215m below surface (FWZ, AD-23-032).
- Drilling will continue until the 20th December, with 4 drill rigs focussed on the increased volume of resource drilling required to define the expanding body of lithium mineralisation at Adina
- 5th drill rig about to commence exploration drilling on new targets at Adina
- New service providers engaged to improve assay turnaround times
- Resource, Environmental and Project Development Studies to support the development of Adina are ongoing

Lithium exploration and development company Winsome Resources (ASX:WR1; "**Winsome**" or "**the Company**") is pleased to announce that drilling has extended lithium mineralisation by over 300m at the 100% owned Adina project in the James Bay region of Quebec, Canada.

Recent results have resulted in an increase in the strike length of mineralisation defined by systematic drilling to 1340m as well as confirming the continuity of mineralisation between Adina Main and Adina East.

High grade mineralisation also continues to be intersected north of Adina Main, with further results from the near surface up-dip extensions of the Main and Footwall Zones as detailed in Table 1 below.

Drilling is increasing in pace following the remobilisation of rigs after the wildfire emergency, with 4 drill rigs focussed on the increased volume of resource drilling required to define the expanding body of lithium mineralisation at Adina. A further 5th rig is about to commence exploration drilling on new targets at Adina.

Resource, Environmental and Project Development Studies to support the development of Adina continue on site. These include an aquatic DNA testing programme in the region and the installation of a weather station to gather baseline environmental data ultimately needed for project approvals.

WINSOME'S MANAGING DIRECTOR CHRIS EVANS SAID:

"Drilling continues to intersect high grade lithium mineralisation as we step out away from the core of the Adina mineralisation and we look forward to further results.

It is great to have the normal routine of drilling back underway at Adina and especially pleasing to see the various Project studies and activities progressing on site in parallel with drilling operations and we have taken action to ensure future assay results are received in improved timeframes. Despite challenges to receiving assays in a timely manner, this has not delayed the expected publication of the MRE at Adina.

The remainder of 2023 will be a very busy time for Winsome with several work programmes to be completed as well as a long list of targets requiring drill testing. "

Hole	Intercepts	Setting	Zone
AD-23-012	1.04% Li_2O over 18.3m from 159.3m to 185.7m (135m vertically below surface)	East / Eastern step-out	Footwall
AD-23-014	1.24% Li_2O over 13.6m from 26.2m to 39.8m (20m vertically below surface)	East / Eastern step-out	Main
AD-23-016	1.23% Li_2O over 8.3m from 6.2m to 14.5m (5m vertically below surface)	East / Eastern step-out	Main
AD-23-032	1.23% Li_2O over 11.4m from 159.3m to 185.7m & 1.14% Li_2O over 11.3m from 206.9m to 214.7m (195m vertically below surface)	East / Eastern step-out	Footwall
AD-23-074	1.37% Li_2O over 4.8m from 121.9m to 126.7m	East / Eastern step-out	Main
	1.42% Li_2O over 18.0m from 159.3m to 185.7m (125m vertically below surface) & 1.29% Li_2O over 7.8m from 206.9m to 214.7m		Footwall
AD-23-076	1.52% Li_2O over 12.1m from 93.4m to 105.5m	East / Eastern step-out	Main
AD-23-078A	1.63% Li_2O over 9.0m from 15.5m to 24.5m	East / Eastern step-out	Main
	2.55% Li_2O over 2.4m from 198.8m to 201.4m (130m vertically below surface)		Footwall
AD-23-089	1.11% Li_2O over 11.0m from 14.6m to 25.6m	Northern step-out	Main
AD-23-091	1.23% Li_2O over 22.2m from 14.8m to 37.0m	Northern step-out	Main
	1.55% Li_2O over 26.4m from 159.3m to 185.7m (135m vertically below surface) & 1.29% Li_2O over 7.8m from 206.9m to 214.7m		Footwall
AD-23-092	1.18% Li_2O over 22.2m from 14.8m to 37.0m	Northern step-out	Main
	1.55% Li_2O over 26.4m from 159.3m to 185.7m (125m vertically below surface) & 1.29% Li_2O over 7.8m from 206.9m to 214.7m		Footwall
AD-23-097	1.47% Li_2O over 6.2m from 53.2m to 59.4m (35m vertically below surface)	East / Eastern step-out	Main
	1.55% Li_2O over 26.4m from 159.3m to 185.7m (125m vertically below surface) & 1.29% Li_2O over 7.8m from 206.9m to 214.7m		Footwall
AD-23-104	1.07% Li_2O over 6.8m from 129.4m to 136.2m (90m vertically below surface) & 1.19% Li_2O over 10.6m from 149.5m to 160.1m	West	Footwall

***Table 1**. Key mineralised intercepts, Adina Main*

Commentary on Drilling Results

Intersections reported in this announcement confirm the continuity of lithium mineralisation in spodumene-bearing pegmatites to the east of Adina Main, with drilling completed on 100m centres up to 300 metres east of drilling previously reported, and to the north of Adina Main, up-dip from previous intersections of the Main and Footwall Zones and closer to surface.

New results received are shown on Figure 1 with all data from the programme to date included in the Appendices. A total of 19 drillholes are reported in this announcement with assays from a further 54 holes pending as at the time of this report. The new results have enabled the company to update the conceptual model for the pegmatite dyke swarms at Adina in preparation for resource modelling.

Results from holes AD-23-012, AD-23-097, AD-23-032, AD-23-049 and AD-23-058 define a complete section stepping 100 metres east of drilling previously reported. Results have also been returned from AD-23-014, AD-23-016 and AD-23-017, which tested for the continuity of mineralisation between Adina Main and Adina East[1]. Mineralisation was returned in all holes enabling the pegmatite swarm to be modelled in this area and follow up drilling planned to better delineate mineralisation.

In addition, results were received from holes AD-23-104 and AD-23-107 on the western side of Adina Main. The strike length of mineralisation between AD-23-107 and AD-23-014 is 1,340 metres, ***representing an additional 340 metres of strike length to that previously defined at Adina Main***.

Results from holes AD-23-012, AD-23-078A, AD-23-091 and AD-23-092 provide additional data to delineate the Footwall Zone to the north of previous drilling, closer to surface, confirming the zone is continuous to shallow depths of 100 to 150 metres from surface. These follow similar results released to the ASX on 4th September 2023. ***Further drill tests are in progress to the north of this drilling to test the Footwall Zone closer to surface.***

Commentary on Operations in Quebec

Drilling at Adina is now achieving targeted levels of production with four rigs focused on resource development drilling. A total of 57 holes for 17,154 metres have been completed since the re-commencement of drilling in August. This places the total drill metres to date at 40,200m at Adina. The Company anticipates completion of a further 10,000 metres of drilling by the end of the year.

Extensional resource drilling is currently testing extensions to mineralisation to the north, west and east of drilling previously undertaken given the success of step-out drilling to date (refer discussion below) as well as completing infill holes to ensure high grade zones are well defined ahead of resource modelling.

Exploration drilling is also planned to test targets defined by gravity survey and as well as targets defined in the recent airborne geophysical survey (refer ASX Announcement 4th September 2023). Data from the airborne survey has recently been received and processed, with exploration targeting work currently underway.

Unfortunately, despite assurances to the contrary, the laboratory Winsome has been using to date has failed to meet the forecast turnaround time agreed at the recommencement of drilling. It has also failed to put into operation the mobile sample preparation unit it promised would be installed in Radisson during October. In response, Winsome is trialling its first batch of assays through an alternative laboratory provider. Fortunately this has not delayed the expected publication of the MRE at Adina.

In addition, work continues on site with environmental and other project studies to aid in the future development of Adina. A meteorological station has also been installed at the site for collection of climate baseline data for environmental studies. An aquatic DNA testing programme in the region is also in progress.

ABOUT WINSOME RESOURCES

Winsome Resources (ASX: WR1) is a Perth-based, lithium focused exploration and development company with four project areas in Quebec, Canada. All of Winsome's projects – Cancet, Adina Sirmac-Clappier and Tilly are 100% owned by the Company. Recently the Company acquired a further 47km^2 of claims at the Tilly Project, located near Adina, and an option over the 29 claims of the Jackpot Property, immediately north of Adina.

The most advanced of Winsome's projects - Adina and Cancet, provide shallow, high grade lithium deposits and are strategically located close to established infrastructure and supply chains.

In addition to its impressive portfolio of lithium projects in Quebec, Winsome Resources owns 100% of the offtake rights for lithium, caesium and tantalum from Power Metals Corp (TSXV:PWM) Case Lake Project in Eastern Ontario, as well as a 19.6% equity stake in PWM. The Company recently divested Decelles and Mazerac, two early stage projects located near the Quebec mining town of Val-d'Or, to PWM in exchange for an increased shareholding.

Winsome is led by a highly qualified team with strong experience in lithium exploration and development as well as leading ASX listed companies. **More details:** www.winsomeresources.com.au

CAUTION REGARDING FORWARD-LOOKING INFORMATION

This document contains forward-looking statements concerning Winsome. Forward-looking statements are not statements of historical fact and actual events and results may differ materially from those described in the forward-looking statements as a result of a variety of risks, uncertainties and other factors. Forward-looking statements are inherently subject to business, economic, competitive, political and social uncertainties and contingencies. Many factors could cause the Company's actual results to differ materially from those expressed or implied in any forward-looking information provided by the Company, or on behalf of, the Company. Such factors include, among other things, risks relating to additional funding requirements, metal prices, exploration, development and operating risks, competition, production risks, regulatory, including environmental regulation and liability and potential title disputes.

Forward-looking statements in this document are based on the Company's beliefs, opinions and estimates of Winsome as of the dates the forward-looking statements are made, and no obligation is assumed to update forward-looking statements if these beliefs, opinions and estimates should change or to reflect other future developments.

COMPETENT PERSON'S STATEMENT

The information in this report which relates to Exploration Results is based on, and fairly represents, information and supporting documentation prepared by Mr Antoine Fournier, VP Exploration of Winsome Resources Ltd. Mr Fournier is a member of the Quebec Order of Geologists (OGQ #0516), a Registered Overseas Professional Organisation as defined in the ASX Listing Rules, and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity which has been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Fournier consents to the inclusion in this release of the matters based on the information in the form and context in which they appear.ends-

[1] Assays previously reported. *"Strong lithium mineralisation recorded from first Adina drill hole assays"* ASX Announcement 6 January 2023

[2] Assays previously reported. *"New assay results confirm strong lithium mineralisation at Adina"* ASX Announcement 14 February 2023

[3] Assays previously reported. *"Assays confirm Adina as a robust, high-grade lithium project"* ASX Announcement 23 March 2023

[4] Assays previously reported. *"Over 3km of lithium mineralisation confirmed at Adina"* ASX Announcement 3 April 2023

[5] Assays previously reported. *"New Lithium Bearing Pegmatite Dyke Swarm at Adina"* ASX Announcement 10 May 2023

[6] Assays previously reported. *"New results confirm multiple zones and continuation of lithium mineralisation at Adina"* ASX Announcement 13 June 2023

[7] Assays previously reported. *"Substantial high-grade intersections continue to grow Adina"* ASX Announcement 1 August 2023

[8] Assays previously reported. *"Key intersections confirm extent of Footwall Zone at Adina"* ASX Announcement 4 September 2023

Appendix 3: Diamond Drilling Summary for Winsome's drilling program at Adina.

AD-22-005 **Assays previously reported**
AD-22-001 **Assays reported in this announcement**
AD-22-006 **Assays awaited, collar/lithological data reported previously**
AD-22-060 **Assays awaited, collar/lithological data reported in this announcement**

JORC Code, 2012 edition Table 1

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	***Explanation***
Sampling techniques	• All core is NQ (76mm) in this program. Core sample intervals were geologically logged, measured for average length, photographed, and placed into numbered core trays. • RC drilling utilised face sampling hammers with samples split down to a 2kg sample size. • Samples from Adina were sent to SGS Minerals Geochemistry under standard preparation procedures. • Gravity data obtained by ground measurements at regular intervals.
Drilling techniques	• NQ diamond drilling was completed at Adina. • Oriented core drilling was not completed. Downhole surveying was conducted using a gyro-based system.
Drill sample recovery	• The recovery of the diamond drilling samples was reported by the operators and supervised by our consulting geologist. • No sample bias has been established.
Logging	• NQ core was logged and cut according to geological boundaries, with ~1 m intervals targeted for individual samples. • For RC and DD drilling features such as rock type, modal mineralogy, rock textures, alteration were recorded. Geological logging information was recorded directly onto the GeoticLog system and compiled onto Database platform, with weekly backups. • The core is stored in the Geological consultants (Technominex) yard in Rouyn-Noranda which is a secure location. • Various qualitative and quantitative logs were completed. All core has been photographed. • The logging database contains lithological data for all intervals in all holes in the database.
Sub-sampling techniques and sample preparation	• Adina drill core was split (sawn) at the Winsome core logging and cutting facility located at the project base in James Bay, with half core samples intervals submitted to SGS preparation facilities in Val-d'Or, Quebec. • Half core NQ samples are believed to be representative of the mineralisation targeted. Sampling intervals are based on geological boundaries to aid representivity. • Samples are crushed, milled and split at the laboratory (SGS) to achieve a 250g sub-sample for assay. Laboratory QC procedures for sample preparation include quality control on checks crushing and milling to ensure representivity.

Criteria	*Explanation*
Quality control & Quality of assay data and laboratory tests	• Assay and laboratory procedures have been selected following a review of techniques provided by laboratories in Canada. SGS and AGAT are both internationally certified independent service providers. Industry standard assay quality control techniques were used for lithium related elements. • Samples are submitted for multi-element ICP analysis by SGS or AGAT Laboratories which is an appropriate technique for high-grade lithium analysis. • Sodium Peroxide Fusion is used followed by combined ICP-AES and ICP-MS analyses (56 elements). Li is reported by the lab and converted to Li_2O for reporting using a factor of 2.153. • No handheld instruments were used for analysis. • Comparison of results with standards indicate sufficient quality in data. No external laboratory checks have been used but are planned to be completed shortly. • Different grades of certified reference material (CRM) for lithium mineralisation were inserted, as well as field duplicates, and blanks. The CRM's submitted represented a weakly mineralised pegmatite (OREAS 750), and a moderate lithium mineralised pegmatite (AMIS 0341) to high grade lithium mineralised pegmatite (OREAS 752 & 753). Quality Assurance and Quality Control utilised standard industry practice, using prepared standards, field blanks (approximately 0.4 kg), duplicates sampled in the field and pulp duplicates at the lab. • Blank samples were submitted at a rate of approximately 5%, same for duplicates and repeat assay determinations, whereas standards were submitted at a rate of approximately 20%.
Verification of sampling and assaying	• Significant intersections have been estimated by consultants to the company and cross checked. • Hard copy field logs are entered into and validated on an electronic database , which is maintained by Winsome on site in James Bay and backed up regularly by the Company's IT consultants in Val D'Or. • Data verification is carried out by the Project Geologist on site, and a final verification was performed by the Senior Geologist and the geologist responsible for database management. An independent verification is carried out by consultants to the company. • No assays have been adjusted. A factor of 2.153 has been applied to the reported Li assays by the laboratory so to report as Li_2O.
Location of data points	• The drill holes have been reported as being located by hand-held GPS. Historical drill holes have been verified by GPS. • The grid datum is NAD83. Zone 18N. • Topographic elevation and landmarks are readily visible from a Digital Elevation Model with a 50cm grid resolution and orthophoto obtained from Lidar surveys performed in 2017 and 2022 over the property. Government topographic maps have been used for topographic

Criteria	*Explanation*
	validation. The GPS is otherwise considered sufficiently accurate for elevation data. • Down hole dip surveys were taken at approximately 30m intervals and at the bottom of the diamond drill holes.
Data spacing and distribution	• In this early delineation stage, drilling is largely set along sections at 100m spacing and aiming to intercept targeted horizon at 80-100m centres. • No assessment has been made regarding the current drill hole location and intersections with respect to resources or reserve estimation. • No sample compositing has been completed. However, internal dilution of non-mineralised material into calculated grade over widths reported herein may occur but is not considerable.
Orientation of data in relation to geological structure	• Drilling is designed to confirm the historical drilling results and test potential mineralisation. They were oriented sub-perpendicular to the potential mineralised trend and stratigraphic contacts as determined by field data and cross section interpretation. Intersection widths will therefore be longer than true widths. • No significant sample bias has been identified from drilling due to the optimum drill orientation described above. Where present, sample bias will be reported.
Sample security	• The company takes full responsibility on the custody of the samples including the sampling process itself and transportation. • Samples are shipped during the weekly supply run and delivered directly to the respective laboratories.
Audits or reviews	• No external audit of the database has been completed, apart from by consulting geologists acting on behalf of the company.

Section 2 Reporting of Exploration Results

(Criteria in the preceding section also apply to this section.)

Criteria	*Explanation*
Mineral tenement and land tenure status	• The Winsome Adina Lithium Project is 100% owned by Winsome Adina Lithium Inc. • All tenements are in good standing and have been legally validated by a Quebec lawyer specialising in the field.
Exploration done by other parties	• Initial Exploration and Review was undertaken by MetalsTech Limited. • Government mapping records multiple lithium bearing pegmatites within the project areas with only regional data available.
Geology	• The mineralisation encountered at the Adina project is typical of a Lithium-Caesium-Tantalum (LCT) type of pegmatite. The pegmatite body is oriented sub-parallel to the general strike of the host rocks. The host rocks are composed of Archean Lac Guyer greenstone rocks, which include mafic and ultramafic rocks interlayered with horizons of metasedimentary and felsic volcanic rocks

Drill hole Information	• For the current drill program, the following information has been included for all holes reported:
	  • easting and northing of the drill hole collar
	  • elevation or RL (reduced level – elevation above sea level in metres) of the drill hole collar
	  • dip and azimuth of the hole
	  • down hole length and interception level
	  • hole length
	• A summary of historical drill hole information was included in the Independent Geologists Report prepared by Mining Insights within the Company's prospectus

Data aggregation methods	• No sample weighting or metal equivalent values have been used in reporting. • Aggregation issues are not considered material at this stage of project definition. No metal equivalent values were used
Relationship between mineralisation widths and intercept lengths	• The pierce angle of the drilling varies from hole to hole, in order to attempt, wherever possible, to represent true widths
Diagrams	• See figures and maps provided in the text of the announcement.
Balanced reporting	• Winsome Resources Ltd will endeavour to produce balanced reports accurately detailing all results from any exploration activities. • All drillholes and intersections have been presented in this announcement and in previous announcements.

Criteria	*Explanation*
Other substantive exploration data	• All substantive exploration data has been included in ASX Announcements. No other substantive exploration data is available at this time.
Further work	• Winsome Resources Ltd continues to complete further site investigations. • Further work planned includes comprehensive data interpretation, field mapping and exploration drilling.
