

RARE EARTHS IDENTIFIED OVER 5 KM STRIKE AT GRØNNEDAL DEPOSIT, GREENLAND

HIGHLIGHTS

- Rare earth mineralisation at Grønnedal extends over 5 km by 2 km, with an exploration target focusing on 3 km by 800 m of ferrocarbonatite defined.
- Extrapolating the outcropping area of ferrocarbonatite to a depth of 50m indicates a potentially significant exploration target of REE mineralisation.
- The grade range for the exploration target comprises a notable proportion of magnet REE (Nd, Pr, Dy, and Tb), which has the potential to be competitive with other REE projects globally.
- A grid-based diamond drilling program is planned, along with detailed geological mapping and petrological studies to better understand REE mineralisation controls.

Eclipse Metals Ltd (**Eclipse** or the **Company**) (ASX: EPM) is pleased to announce that it has delineated a rare earth element (REE) exploration target at Grønnedal within its 100% owned Ivigtût multi-commodity project in SW Greenland. While the rare earth mineralisation at Grønnedal extends over 5 km by 2 km of nepheline syenite, the exploration target currently encompasses an approximately 3 km by 800 m section of ferrocarbonatite intruding the syenite (**Targeted Area**). This Targeted Area is highlighted in Figure 1 and is derived from a combination of recent exploration, a geophysical assessment and review of public domain data.

Data from a 1995 DIGHEM airborne magnetic survey highlights several ovoid shaped responses associated with brecciated ferrocarbonatite bodies (Fig. 2) (refer ASX announcement 9 February 2021). Comparative analysis of the magnetic response with the mapped extent of the ferrocarbonatite suggests a more widespread presence of these formations than previously mapped. Furthermore, 3D inversion interpretation of the magnetic data shows that the carbonatites extend to at least one kilometre below the surface where the two discrete bodies coalesce. In addition, the DIGHEM electromagnetic data revealed seven conductive targets, potentially sulphide mineralisation, recommended for follow up investigation with drilling.

Figure 3: 3D inversion of DIGHEM magnetic data. Isosurfaces: red – 0.15 orange 0.13 yellow 0.11 SI (Fathom Geophysics).

Upon conservative analysis, extrapolating only the outcropping area of ferrocarnatite (approximately 1.4 million m²) to a depth of 50m indicates yields an **exploration target of between 175 and 245 million tonnes of REE mineralisation** based on a plausible range of rock density (2.5 and 3.5 gm/cm³ respectively) (**Exploration Target**).

The anticipated grade for the Exploration Target is between 0.25 and 0.50% TREE including **32% – 39%** magnet REE (Nd, Pr, Dy and Tb) based on previously reported results from pitting and drilling in a small part of the Central carbonatite body (refer ASX announcements 25 July and 8 August 2023) as well as historic surface rock sampling (Fig. 1; Table 1).

The potential quantity and grade of the Exploration Target is conceptual in nature. There has been insufficient exploration work conducted to estimate a Mineral Resource and it is uncertain if further exploration will result in the estimation of a Mineral Resource. The Exploration Target has been prepared based on actual exploration results described in this report including historical and recent drilling data and geological modelling.

Dataset	Total Samples	Samples > 300 ppm TREE		Ave. TREE ppm ¶	Magnet REE	
		#	%		ave. ppm	% total
EPM pits (< 2 m) ¹	52	51	98	4,694	1,839	39
EPM percussion drill holes (0 - 22 m) ²	224	158	71	3,602	1,185	33

¹ ASX Announcement 25 July 2023

² ASX announcement 8 August 2023

Bedford (1989) surface samples (refer JORC tabled annexed)	24 ³	24	100	3,624	1,059	>29
	6 ⁴	6	100	6,378	1,910	>32

Table 1: Summary of TREE grade information for the Grønnedal ferrocarnatites in parts per million (ppm). [¶] Average grade relates to samples > 300 ppm TREE. ³ Analysis of La, Ce and Nd only by XRF. ⁴ Analysis by INAA of 10 only of the 15 REE. Pr and Dy were not determined (Bedford, 1989).

With this in mind, the Company notes the exploration target is based upon analytical results to date that indicate a high proportion of the so-called magnetic REE in the total REE “basket” (Table 1) within the Targeted Area. **The range of magnet REE (MREE) is between 32% and 39%** which compares favourably with the proportion of MREE publicly disclosed in relation to other REE projects, including the Songwe Hill project in Malawi and the Yangibana project in Australia.

There has been insufficient exploration work conducted to confirm if the estimated proportion of MREE within the Targeted Area is indicative of the proportion of MREE contained throughout the broader mineralisation at Grønnedal. Further sampling and analytical work will need to be obtained throughout the remainder of the mineralisation at Grønnedal and there can be no guarantee that such data will be consistent with the Grønnedal analytical results to date.

In addition to the ferrocarnatite Exploration Target, historical public domain rock chip sampling of the composite intrusion reveals that anomalous levels of rare earth elements La, Ce and Nd occur over the full 5 km length of nepheline syenite exposed within the company’s tenement (Figure 1; Bedford, 1989). While the ferrocarnatite intrusions at Grønnedal are generally richest in La, Ce and Nd, highly anomalous values have been recorded throughout the nepheline syenite body and related altered rocks (Figure 1 and Table 2).

Combined La + Ce + Nd ppm	# Samples	Max	Mean	Median
All Data	236	15,203	685	220
Carbonatite	24	8,256	3,624	3,566
Altered Syenite	25	15,203	920	209
Other	4	560	403	398
Syenite II	40	981	289	229
Syenite I	129	1,132	258	185
Altered Gneiss	14	689	381	361

Table 2: Summary of La, Ce and Nd (ppm) content of various rock types at Grønnedal from historic surface rock sampling (Bedford, 1989). Other rare earth elements were not analysed.

Figure 4: Grønnedal pitting results (Refer ASX announcement 25 July 2023). See Figure 1 for location of these pits within the Central carbonatite.

A program of diamond drilling is planned to test the ferrocarnatite exploration target together with detailed geological mapping and petrological studies aimed at better understanding controls on REE mineralisation, particularly in the less well understood altered syenites.

Executive Chairman Carl Popal commented: "Eclipse is extremely pleased with these results and is excited to contemplate what the future might bring. The Ivigtút mining precinct contains the world's only historical mine of the rare mineral cryolite and is now developing as a leader in rare earth element (REE) mineralisation with exploration of the nearby large Grønnedal carbonatite body. This carbonatite is enriched in elevated medium REE mineralisation when compared with other parts of the globe containing similar carbonatite REE. Grønnedal REE's presents a strategic global project in tier 1 jurisdiction, with existing infrastructure for development, and will become more of a priority in the current global environment. The large REE strike area has the potential to be the leader, playing a pivotal role in the magnetic REE global supply chain for the EU and US.

We are poised to work on significant commercial aspects of the Ivigtút project through the coming year, which includes not only Grønnedal REE but also the critical mineral domains within the Ivigtút pit. The Company is poised to rejuvenate the Ivigtút mine to be once again a global project in the supply of critical minerals and REE. We are currently developing the Environmental Impact Assessment (EIA) and Social Impact Assessment (SIA) aspects and planning dewatering of the historical pit for pre-feasibility and mining of the remaining mineralisation.”

About Eclipse Metals Ltd (ASX: EPM)

Eclipse Metals Ltd is an Australian exploration company focused on mineral exploration in South-western Greenland, Northern Territory and Queensland for multi commodity mineralisation. Eclipse Metals Ltd has an impressive portfolio of assets prospective for cryolite, fluorite, siderite, quartz, REE, gold, platinum group metals, manganese, palladium, vanadium and uranium mineralisation. The Company’s mission is to increase shareholders’ wealth through capital growth and ultimately dividends. Eclipse Metals Ltd plans to achieve this goal by exploring for and developing viable mineral deposits to generate mining or joint venture incomes.

Competent Persons Statement

The information in this report / ASX release that relates to Exploration Results and Exploration Targets is based on information compiled and reviewed by Dr. Andy Wilde, consultant to Eclipse Metals Ltd. Dr Wilde holds a PhD in geology from Monash University and is a fellow and registered professional geoscientist (RPGeo Mineral Exploration) of the Australian Institute of Geoscientists and has sufficient experience relevant to the styles of mineralisation under consideration and to the activity being reported to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Dr Wilde consents to the inclusion in this report / ASX release of the matters based on information in the form and context in which it appears. Additionally, Dr Wilde confirms that the entity is not aware of any new information or data that materially affects the information contained in the ASX releases referred to in this report.
