20th December 2023

BULK SAMPLING AND TEST PIT PROGRAM COMPLETED
AT THE LAKE HOPE HPA PROJECT, WA

A significant bulk sampling and test pits program has recently been completed at Impact Minerals Limited’s (ASX:IPT) flagship Lake Hope High Purity Alumina (HPA) project located 500 km east of Perth in Western Australia. The program is a critical component of the Pre-Feasibility Study on Lake Hope, which is currently underway following a positive Scoping Study on the project that indicated the project may be the lowest-cost producer of HPA globally by a significant margin (ASX Release 9th November 2023).

Impact has the right to earn an 80% interest in the Lake Hope project by completing the Pre-feasibility Study (ASX Release 21st March 2023).

A total of 5.5 tonnes of material was collected from twenty-five bulk samples taken from test pits across West Lake and East Lake, which host the alumina deposit at Lake Hope. The deposit contains a resource of 3.5 million tonnes at 25.1% alumina (Al₂O₃) for a contained 880,000 tonnes of alumina, of which about 88%, or about 775,000 tonnes of alumina, is in the higher confidence Indicated Resource category (ASX Release 19th June 2023).

Impact confirms that no new information exists, and all modifying factors remain the same as at the time of the first publication of the resource.

In addition, earthworks for access tracks and drill pads for water bores for groundwater monitoring were also completed.
Managing Director Dr Mike Jones said: “This bulk sampling program marks another significant milestone in our journey towards the production of High Purity Alumina (HPA) from Lake Hope and caps off a very busy and successful nine months since acquiring the rights for this exceptional project.

In that time, we have completed a maiden resource statement, obtained heritage clearance from the Ngadju First Nations people, completed most of the first phase of metallurgical test work using the unique Playa One sulphate process, and completed a Scoping Study. The results of that study were outstanding and demonstrated the potential of Lake Hope to produce HPA at a cost much less than any other supplier globally, and this has given us the confidence to progress the pre-feasibility study aggressively. The bulk samples will set us up for the forthcoming stages of development, which will include the commissioning of a mini-pilot plant once the initial test work is completed.

Our focus for 2024 will be to complete the PFS, which will include setting up the mini-pilot plant and, in particular, producing HPA in bulk for potential customers and off-take partners. As part of this strategy, we have already started reaching out to key groups in the battery and LED market, and the demand is there. We look forward to a watershed year for Lake Hope, Impact and its shareholders”.

About the Bulk Sampling and Earthworks Program

Impact commissioned Pinnacle Site Services to undertake an earthwork and bulk sampling program. A backhoe was used to refurbish the existing access track to the site, construct access tracks to the lakes and a drill pad for a water monitoring bore.

A total of 5.5 tonnes of aluminous mud was collected from 25 pits, 13 from West Lake and 12 from East Lake (Table 1 and Figure 1). Ground conditions during excavation of the lake surfaces were excellent, with the mud hard, dry and easily dug. Groundwater was absent in most excavations, likely due to the dry summer conditions, which emulate the three-yearly summer mining campaigns proposed in the Scoping Study (ASX Release 9th November 2023).

A number of the sample sites were left open for geotechnical studies on the performance of the mud with respect to slope stability and groundwater levels, both of which will be monitored over the next 12 months before rehabilitation.

These ground-disturbing activities were enabled after successful Aboriginal Culture and Archaeological surveys were completed in July with the Ngadju Native Title group (ASX Release 27th July 2023). The survey identified no sites of cultural or archaeological significance, which is critical for Impact lodging a Mining Lease Application.

Update on the Pre-Feasibility Study

Impact has continued to progress the Preliminary Feasibility Study on Lake Hope.

The Baseline Flora and Fauna Survey data collection process is complete, with a final report due early in Q1 2024. Once received, the results will be used to finalise the location of mining lease boundaries and infrastructure corridors. A Mineralisation Report, a critical requirement of a mining lease application, has been completed, and the application will be lodged as soon as practicable in Q1 2024.

The metallurgical test work has progressed to final purification testing, with preliminary results expected in January 2024 (Stages 4 and 5 of the Playa One Sulphate Process, ASX Release 18th October 2023). Design of the by-product circuit and re-design of acid and reagent handling strategy is underway to investigate options for reduced capital and energy costs. A comprehensive test work regime is under design to inform a mini-pilot plant configuration, with quotes being sought.
Mine planning is progressing, with work underway to refine equipment selection and identify blocks within the mineral resource sufficient for an initial 25-year mine life.

Managing Director

Competent Persons Statements

The information in this report related to Exploration Results and metallurgical test work is based on and fairly represents information and supporting documentation prepared by Roland Gotthard, a consultant geologist to Impact Minerals Limited. Mr Gotthard is a Member of the Australasian Institute of Mining and Metallurgy. He has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration and to the activity that has been undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (The JORC Code). Mr Gotthard consents to including these matters in this release based on the information in the form and context in which they appear.

The data in this report that relates to Mineral Resource estimates is based on information evaluated by Mr Simon Tear, who is a Member of The Australasian Institute of Mining and Metallurgy (MAusIMM) and who has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (the "JORC Code"). Mr Tear, a Director of H&S Consultants Pty Ltd, consents to including the Mineral Resource in the report in the form and context in which it appears.

</thead>
<tbody>
<tr>
<td><strong>Mineral tenement and land tenure status</strong></td>
<td>- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</td>
<td>• E63/2686 Lake Hope • E63/2317 Hope North • E63/2318 Exclamation Lake • E63/2319 Hope South • E74/673 Mends South • 74/674 Mends North • E63/2730 • E74/779 • IDE Playa One Pty Ltd, Impact earning in Native Title Agreements are in place with Native Title parties • No known impediment to exploitation is known • No national parks, nature reserves or other licenses interact tenure</td>
</tr>
<tr>
<td><strong>Exploration done by other parties</strong></td>
<td>- Acknowledgment and appraisal of exploration by other parties.</td>
<td>None</td>
</tr>
<tr>
<td><strong>Geology</strong></td>
<td>- Deposit type, geological setting and style of mineralisation.</td>
<td>Locustine evaporite clays hosted within flat-lying salt lake deposits</td>
</tr>
<tr>
<td><strong>Drill hole Information</strong></td>
<td>- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length.</td>
<td>• All bulk sample locations and masses are provided in Table 1 • No drill collars are reported as no survey or RL data are reported • RL is corrected to surveyed DTM</td>
</tr>
<tr>
<td><strong>Data aggregation methods</strong></td>
<td>- In reporting Exploration Results, weighting averaging techniques, minimum and/or maximum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.</td>
<td>No compositing of the bulk samples for grade and mass has occurred at this time • No lower cut-off grade is used at this time • No upper cut-off is used as the material is homogeneous</td>
</tr>
<tr>
<td><strong>Relationship between mineralisation widths and intercept lengths</strong></td>
<td>- These relationships are particularly important in the reporting of Exploration Results.</td>
<td>pits dug into flat-lying mineralisation</td>
</tr>
<tr>
<td><strong>Diagrams</strong></td>
<td>- Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</td>
<td>A map showing tenement locations has been included • Maps showing test pit locations is provided</td>
</tr>
<tr>
<td><strong>Balanced reporting</strong></td>
<td>- Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</td>
<td>Not applicable to bulk sampling</td>
</tr>
<tr>
<td><strong>Other substantive exploration data</strong></td>
<td>- Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</td>
<td>No other meaningful exploration information is included</td>
</tr>
<tr>
<td><strong>Further work</strong></td>
<td>- The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale stop-line drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</td>
<td>Metallurgical compositing and pilot plant testing</td>
