auricmining

Grade Control Drilling Program Completed at Munda Gold Project

Highlights

- Grade control drilling program at Munda Gold Project completed with 351 holes drilled.
- Assays received for 244 holes including numerous high-grade intersections such as:

MGCR0401	16m @ 12.54g/t Au
MGCR0057	9m @ 21.37g/t Au, including 1m @ 184.60g/t Au
MGCR0007	4m @ 20.13g/t Au, including 1m @ 77.18g/t Au
MGCR0372	4m @ 18.84g/t Au, including 1m @ 68.94g/t Au

- An updated resource model integrating the grade control drilling will be completed once all results are received.

Management Comment

Managing Director, Mark English, said: *"It is terrific to be back drilling and concentrating on Munda. This is our main asset and flagship project. The drilling results to date have provided many high grade gold intersections.*

"Only 70% of the assay results have been received, so we don't have a complete understanding, but we are excited with the gold results so far. It will take more time to fully analyse the data from the 10,985 samples collected and then to define the way forward.

"We believe that Munda will become a sizeable cash producer for Auric. Last year's Scoping Study showed of the order of 112,000 to 129,100 ounces of gold can be mined from Munda. Munda is where our efforts are focused."

The Announcement

Auric Mining Limited (ASX: **AWJ**) (**Auric** or **the Company**) is pleased to announce that the first phase of grade control drilling has been completed at the Munda Gold Project, near Widgiemooltha, WA.

A total of 351 holes were drilled on a 10m x 10m pattern for 10,895m. Assays have been received for 244 holes, up to 19 January 2024, representing approximately 70% of the samples submitted.

Assay results include numerous significant intercepts at a 0.5g/t Au cut-off (Appendix 1) with high grade or broad intercepts such as:

MGCR0401	16m @ 12.54g/t Au
MGCR0057	9m @ 21.37g/t Au, including 1m @ 184.60g/t Au
MGCR0007	4m @ 20.13g/t Au, including 1m @ 77.18g/t Au
MGCR0372	4m @ 18.84g/t Au, including 1m @ 68.94g/t Au
MGCR0035	7m @ 4.03g/t Au
MGCR0070	14m @ 2.55g/t Au, including 1m @ 23.2g/t Au
MGCR0082	17m @ 1.57g/t Au
MGCR0084	12m @ 3.38g/t Au
MGCR0116	9m @ 5.40g/t Au
MGCR0150	5m @ 4.39g/t Au
MGCR0280	9m @ 3.85g/t Au
MGCR0367	6m @ 4.64g/t Au, including 1m @ 24.14g/t Au
MGCR0385	6m @ 3.42g/t Au
MGCR0392	4m @ 6.49g/t Au
MGCR0402	11m @ 4.51g/t Au, including 2m @ 18.11g/t Au

Grade Control Program

The drill pattern covered the starter pit defined in a recent Scoping Study[1] within a larger area of near surface mineralisation (Figure 1).

Drilling was undertaken by Kalgoorlie-based Total Drilling Services Pty Ltd (TDS). Most holes were drilled vertically to depths of 30-35m, targeting either the 350m or 345m reduced level (RL). Angled holes were drilled around the margin of the historic Resolute trial pit together with some in the trial pit. Shallower vertical holes were drilled in the Resolute trial pit to reach the same elevations.

[1] *(ASX: AWJ) 28 June 2023: Positive Scoping Study for Munda Gold Project*

+61 8 9548 9997 | info@auricmining.com.au | Level 1, 1 Tully Road, East Perth, WA 6004 | www.auricmining.com.au

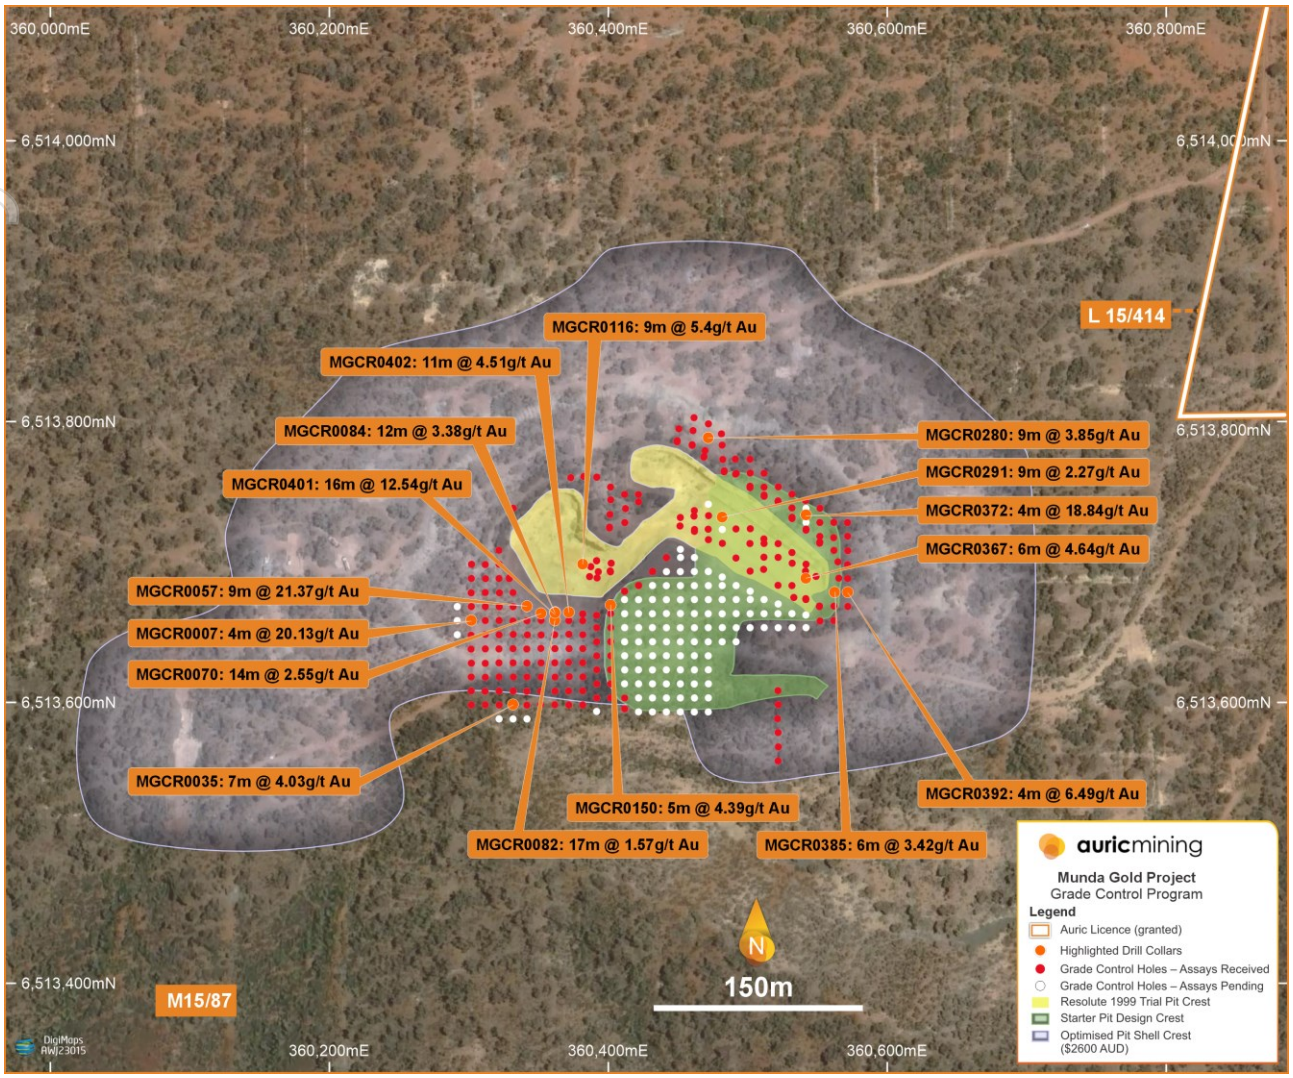

Figure 1. Munda optimised pit outline, starter pit and existing trial pit with completed grade control drill holes and selected intercepts at a 0.5g/t cut-off.

RC drill holes were sampled at 1m intervals and samples assayed for gold via a 50g fire assay. Significant assays at a 0.5g/t cut-off are recorded in Appendix 1 and drill hole details in Appendix 2. A JORC checklist describing sampling techniques and reporting criteria is shown in Appendix 3.

The assay results reaffirm the frequent high grades and limited continuity of gold mineralisation. Geological logging confirms that gold mineralisation is visually very subtle with a well-developed foliation common but only trace sulphides and often no veining. The use of close-spaced grade control drilling will be essential to detailed definition and mining of the deposit.

A resource model will be developed for the volume defined by the grade control drilling once all results are received. This will lead to a refined model for the deposit and a basis for further assessment of development options. The drill data will also be used to assess optimal grade control drill spacing which will be closer spaced than 10m x 10m.

Other Work Completed

A 7-hole RC drilling program is underway to test several drill targets approximately 1km to the east of the Munda gold deposit, within the Munda mining lease, M15/87. The drill rig operated by Kalgoorlie-based Kennedy Drilling will then drill 10 grade control holes at Munda to add drill detail to 2 areas of mineralisation defined by results to date from the grade control program.

A detailed topographic survey was completed by Spectrum Surveys, covering most of Mining Lease, M15/87 and a section of the planned haul road within Miscellaneous Licence, L15/414.

Samples representing a range of potential waste rock types and ore stockpiles have been submitted for Acid Mine Drainage testwork under the supervision of MBS Environmental.

Metallurgical sampling is ongoing with several ore types well represented in the grade control drilling, sampled accordingly.

Compliance Statements

The information in this announcement that relates to exploration results is based on and fairly represents information and supporting documentation compiled by Mr John Utley, who is a full-time employee of Auric Mining Limited. Mr Utley is a Competent Person and a member of the Australian Institute of Geoscientists. Mr Utley has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Utley consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Information on the Scoping Study for Munda is extracted from the report *Positive Scoping Study for Munda Gold Project* announced to the ASX on 28 June 2023 and is available to view on the Company website; www.auricmining.com.au. The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement. The company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

This announcement has been approved for release by the Board.

Appendix 3
Munda Grade Control Drilling JORC Table 1 Checklist

Section 1 Sampling Techniques and Data
(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	• RC drill samples were taken at 1m intervals via a cyclone and fixed cone splitter. Samples of nominally 1.5kg were collected in calico bags and submitted to the Intertek Genalysis sample preparation facility in Kalgoorlie. Samples were pulverised to a nominal 85% passing 75µm. Approximately 200g of the pulverised product from each sample was then transferred to the Intertek Genalysis facility in Perth. • Samples were analysed for Au via 50g fire assay with an ICP-OES determination of gold concentration. • The samples for each 1m interval remaining after removal of the nominal 1.5kg split were laid out in rows at the drill site and this material used for geological logging
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	• RC drilling using a face-sampling hammer with a drill bit (hole) diameter of approximately 133mm.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximize sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have	• Sample recovery is assessed as having been reasonable overall. Samples submitted for assay were weighed at the lab and sample weights reported – they show some small samples in the 1st few metres of drill holes and an average weight of 2.2kg. • There is no evidence of sample bias

+61 8 9548 9997 | info@auricmining.com.au | Level 1, 1 Tully Road, East Perth, WA 6004 | www.auricmining.com.au

Criteria	JORC Code explanation	Commentary
	occurred due to preferential loss/gain of fine/coarse material.	
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged.	• Drill chips were logged at 1m intervals corresponding to the sample intervals and according to Auric's coding system in sufficient detail to support mineral resource estimation, mining studies and metallurgical studies. • The logging is qualitative in nature. • Chips were not photographed but a small proportion of chips from each interval have been retained in compartmentalised chip trays. • The total length logged is 10,895m which is 100% of the drilled intervals
Sub-sampling techniques and sample preparation	If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled.	• RC chips were sampled at 1m intervals via a fixed cone splitter and samples were dry. • A duplicate sample was taken with every 15th sample using a 2nd chute on the splitter and a pulp standard was inserted after every 30 samples such that 10% of samples submitted for assay are either duplicates or standards. • The duplicate assays show very good correlation with original assays (Pearson Coefficient = 0.99). • Sample sizes (nominally 1.5kg) were pulverised prior to subsampling of 50g for fire assay and are considered appropriate.
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	• In addition to standards submitted by Auric, the laboratory (Intertek Genalysis) analysed standards and blanks inserted with each fire assay batch. Comparison of expected results for standards with the assays received for the RC samples indicates accurate and precise laboratory data.
Verification of sampling	The verification of significant intersections by either independent or alternative company personnel.	• Anomalous assays have been verified by alternative Auric personnel. • No twinned holes have been drilled.

+61 8 9548 9997 | info@auricmining.com.au | Level 1, 1 Tully Road, East Perth, WA 6004 | www.auricmining.com.au

Criteria	JORC Code explanation	Commentary
and assaying	The use of twinned holes. Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data.	• Field sample records are merged with assay results from the lab and various cross reference checks, both manual and computational used to ensure data integrity. • Data is stored on two separate computers and backed up routinely. • No adjustment has been made to assay data
Location of data points	Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control.	• Hole collar positions were marked out by a qualified surveyor using a DGPS and located again following completion by the same surveyor. • Angled holes and a small proportion of vertical holes were surveyed downhole using a north-seeking gyroscope. • Collar surveys included an elevation measurement and are located within the MGA-GDA94 grid system, Zone 51
Data spacing and distribution	Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied.	• 351 holes were drilled on a 10m x 10m pattern to a vertical depth of up to 54m, averaging 31m • The data spacing is sufficient to estimate mineral resources but will require greater density for ore definition should open pit mining be undertaken • No sample compositing
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	• There are several structural controls and the drill holes will intersect structures at variable orientations. However, the high drill density will nullify sampling bias in terms of geostatistical resource estimation
Sample security	The measures taken to ensure sample security.	• Auric personnel were present during all drilling and sampling and individual samples were bagged and sealed in larger polywoven bags with no opportunity for tampering. • Samples were transported to the lab by Auric personnel
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	• Duplicate samples were taken after every 15 samples and show very good correlation, demonstrating that sampling techniques were appropriate and robust

Section 2 Reporting of Exploration Results
(Criteria listed in the preceding section also apply to this section)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	• The Munda resource lies within M15/87 which is held by Widgie Gold Pty Ltd, a wholly owned subsidiary of Auric Mining Ltd who hold all the mineral rights, excluding Ni and Li. • M15/87 was granted on 06/08/1984 and expires on 05/08/2026. • There are no known impediments to mining in the area beyond routine compliance requirements
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	• Early exploration (1967-1995) focused on nickel. • WMC (1996-1998) recognised gold potential and drilled for both nickel and gold including 81 diamond and RC holes in the current resource area. • Resolute (1999-2000) optioned the project from WMC, drilled 37 holes and excavated a small trial mine with ore carted to the Higginsville gold plant. • Titan Resources (2005-2006), Consolidated Nickel (2006-2007), Eureka Mines (2016) and Estrella Resources (2019) all undertook drilling programmes focused in the current resource area.
Geology	Deposit type, geological setting and style of mineralisation.	• Gold mineralisation is hosted near the intersections of a northeasterly striking structure with structures parallel to the northeasterly dipping contact between basalts and overlying serpentinised ultramafics. • The ultramafic contact is also host to nickel mineralisation such that gold and nickel deposits overlap.
Drill hole Information	• A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: o easting and northing of the drill hole collar o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar o dip and azimuth of the hole o down hole length and interception depth o hole length.	• Refer to: Appendix 1: Significant gold intervals at 0.5g/t cut-off Appendix 2: Drill Hole Details

+61 8 9548 9997 | info@auricmining.com.au | Level 1, 1 Tully Road, East Perth, WA 6004 | www.auricmining.com.au

Criteria	JORC Code explanation	Commentary
	If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated.	• Samples were collected at 1m intervals and aggregate intervals incorporate only 1m intervals. • Samples were aggregated at a 0.5g/t cut-off with no top-cut applied
Relationship between mineralisation widths and intercept lengths	These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').	• Down hole lengths are reported and mineralisation geometry appears to be quite variable such that true widths are not known
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	• Refer to Figure 1 and Appendix 1
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	• Reporting is balanced – only significant Au values at a 0.5g/t cut-off are tabulated and this is acknowledged
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	• Not applicable
Further work	The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	• The 10m x 10m grade control drill data will be used to generate a resource estimate which will then be compared with the estimate for the full resource which was defined on a nominal 25m x 25m drill pattern and encloses the grade control drilling
