Multiple Lithium Anomalies Enhance Prospectivity of Solonópole Project

Highlights

Solonópole Lithium Project, Ceará, Brazil

- **Anomalous lithium values above 100 ppm (and up to 631 ppm) found in 383 soil samples within existing and new target areas.**
- **Integration and interpretation of these soil sample results with data from geophysics, geological mapping (125 line km), trenching and RC drilling (~2,000m) further enhance prospectivity of existing and new targets.**
- **Combined datasets confirm several swarms of pegmatite bodies striking in a NE-SW direction and identify new high priority areas.**
- **Nira interpreted to be the most prospective new target, with 180 soil samples of >100 ppm Li and as high as 524 ppm Li covering an area of at least 1km^2.**
- **Nira also features 17 pegmatite outcrops with average widths of up to 30 meters and strike lengths from 200m to 600m.**
- **Planning for the next follow-up diamond drilling campaign is underway.**

Oceana Lithium Limited (**ASX: OCN, "Oceana"** or **"the Company"**) hereby reports soil sample results from its **Solonópole Lithium Project** in Ceará State, Brazil, with 383 samples returning anomalous lithium values in soil above 100 ppm and up to 631 ppm.

Oceana's Senior Geologist **James Abson** said: *"These highly anomalous soil sample results, both Li and LCT-pathfinder, combined with the anomalous lithium and tantalum grades identified by the initial scout drilling program, backed up by the geophysical and geological mapping data, now provide all the key elements for the optimal planning of a high-quality hard rock lithium diamond drilling campaign. We look forward to further drill testing some of these high priority areas at depth, below the weathering surface, particularly the new target Nira."*

For more information on previous exploration results at Solonópole, refer to Oceana´s ASX Announcements 7 August 2023, 3 November 2023 and 5 January 2024. The status of the large-scale infill soil sampling program that commenced in March 2023 relative to the location of the main exploration areas is shown in **Figure 1** below.

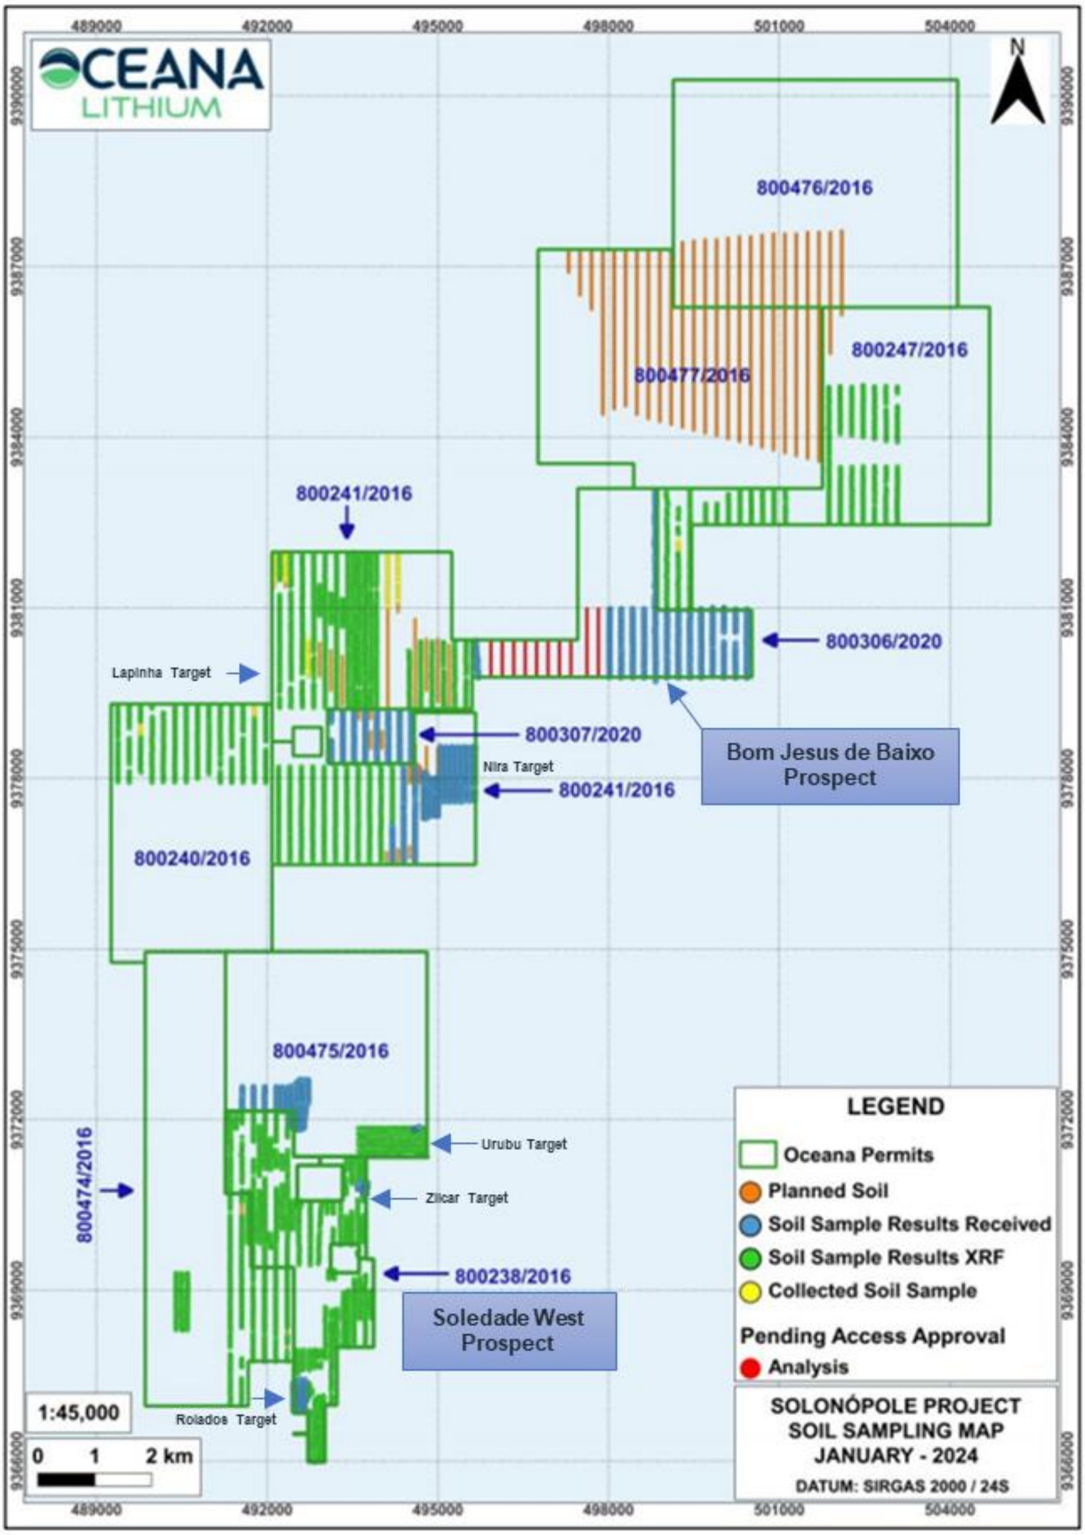

***Figure 1:** Map showing soil sampling map and the approximate location of the main exploration areas*

As at 31 January 2024, over 8,300 soil samples had been collected from Solonópole and analysed by X-Ray Fluorescence (XRF) for Lithium-Caesium-Tantalum (LCT) pathfinders, of which 1,908 soil samples now have lab results validated by Oceana´s internal QA/QC. These results show a median lithium value of approximately 42 ppm and an average lithium value of 69 ppm (*background*). Anomalous lithium values above 100 ppm and up to 631 ppm were found in 383 soil samples within existing and new target areas. Please refer to **Appendix 1** (**Table 4.1** to **Table 4.6**) for soil sample results and coordinates.

Oceana has integrated these soil sample results with other datasets from geophysics, geological mapping (125 line km), trenching and RC drilling (~2,000m). The combined datasets confirmed several swarms of pegmatite bodies striking in a NE-SW direction and identified high priority areas showing more than one lithium bearing pegmatite.

High Priority Areas

1) Bom Jesus de Baixo ("BJdB") Prospect

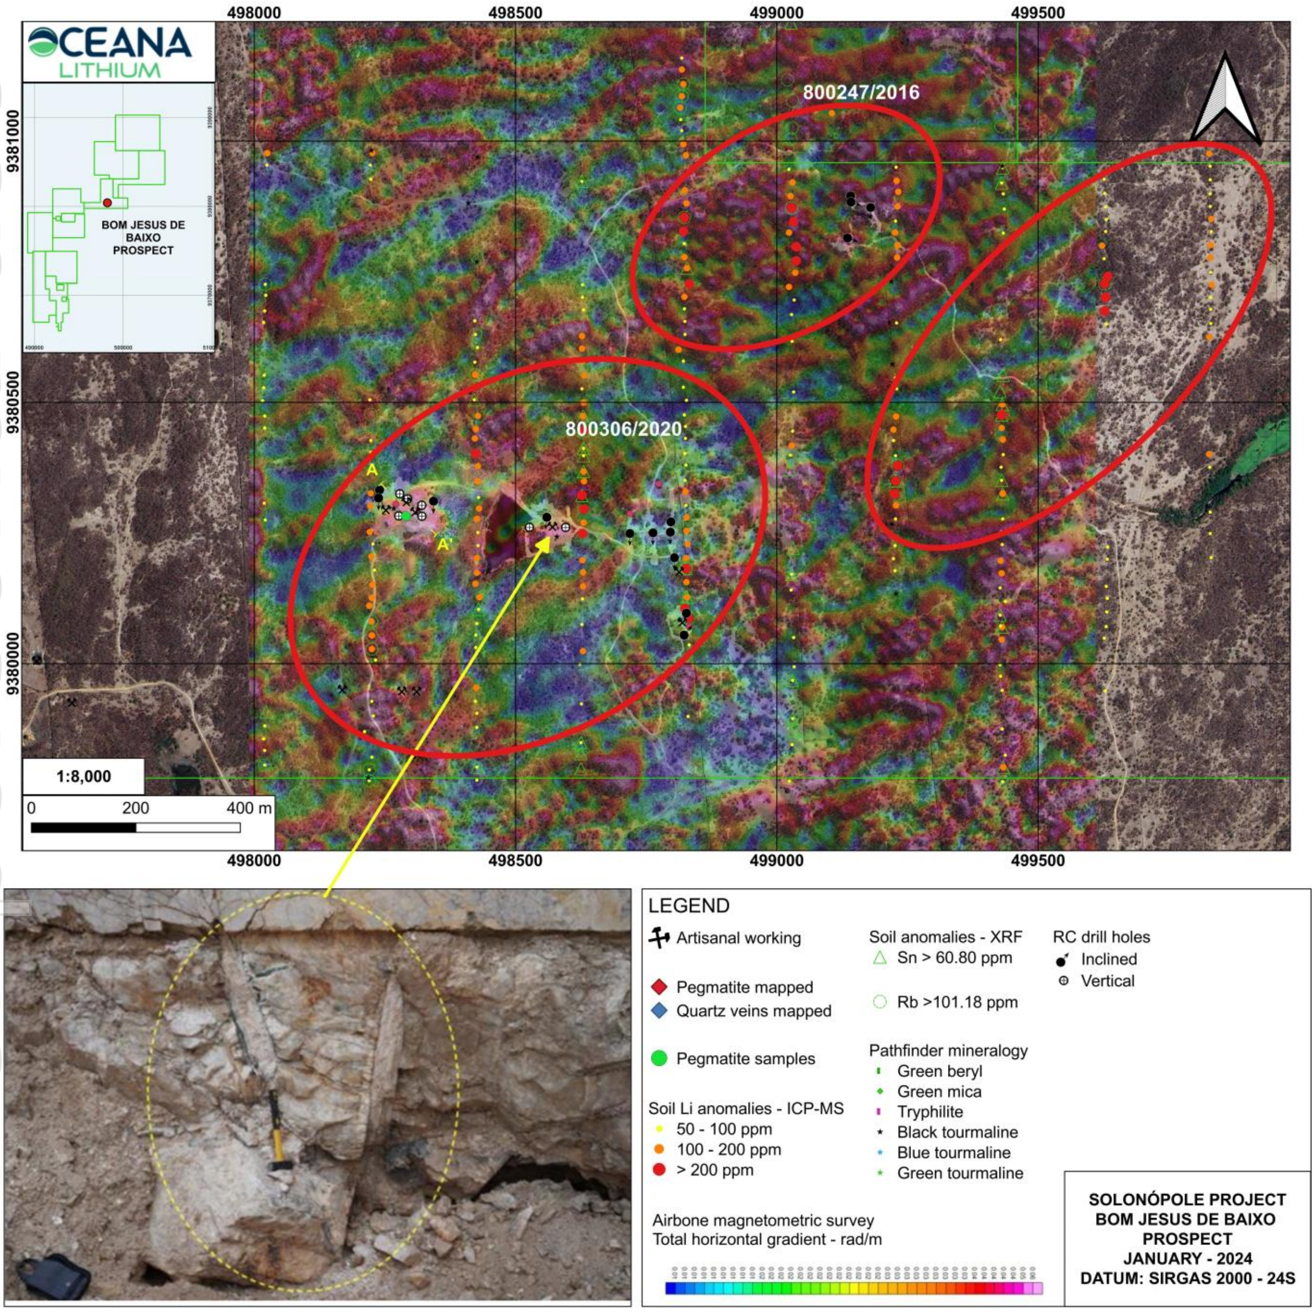

Figure 2: *Bom Jesus de Baixo Prospect - Integrated Map and Main Results*

The Bom Jesus de Baixo (BJdB) Prospect is the most advanced exploration target at the Solonópole Project. The best scout drilling results from BJdB to date include anomalous lithium grades in three drill holes (NGR-RC-002, NGR-RC-009 and NGR-RC-014):

- BJdB Pit Area: NGR-RC-002, with maximum value over 1m of 0.83% Li_2O from 37m to 38m. A lithium-mineralised zone exists from 23m to 38m (15m not true width) averaging 0.34% Li_2O, including 6m at 0.50% Li_2O. This hole is proximal to where spodumene was previously identified in the BJdB pit.

- BJdB Central Area: NGR-RC-009, with maximum value over 1m of 0.42% Li_2O from 16m to 17m. A lithium-mineralised zone exists from 7m to 17m (10m not true width) averaging 0.20% Li_2O, including 3m at 0.31% Li_2O.

- Tin Mine Area: NGR-RC-014, with maximum value over 1m of 0.45% Li_2O from 5m to 6m. A lithium-mineralised zone exists from 4m to 7m (3m not true width) averaging 0.32% Li_2O.

The geochemical assay signatures (low P, and low Rb and Cs) indicate that the lithium-bearing mineral may be spodumene, which Oceana has previously identified at surface in a weathered state nearby (refer to ASX Announcement dated 1 March 2023). X-Ray Diffraction (XRD) analysis will be undertaken to confirm this observation on these RC chips in the coming months. Deeper drilling into these unweathered fresh zones is warranted to test whether weathering near surface has resulted in possible leaching of lithium-bearing mineralisation.

As shown in **Figure 2**, 129 soil samples collected at Bom Jesus de Baixo Prospect have returned anomalous lithium values above 100 ppm (up to 506 ppm).

The area with elevated soil anomalies is approximately 3km^2, with 24 soil samples showing lithium values above 200 ppm. Within this anomalous area, Oceana geologists have observed nine artisanal workings and at least 26 pegmatite bodies with average widths of 30m and strike lengths from 150m up to 600m. These pegmatites strike NE-SW and dip to the NW, based on geophysical interpretation and the information gained from the shallow RC drill holes.

Oceana did not have all this additional information prior to the first shallow RC drilling campaign completed in May/June 2023. With it now at hand, the Company has determined that a follow-up diamond drilling campaign is warranted with drillholes perpendicular to strike against the dip, using a preliminary 3D model to guide the exact positioning. Future drilling would need to be to depths of 150m to 200m to effectively test for Li mineralisation below the weathered zone located in top 60m previously tested.

2) Nira Target

Oceana geologists have classified Nira as a high priority area. As shown in **Figure 3**, 180 soil samples collected at Nira have returned anomalous lithium values above 100 ppm (up to 524 ppm). The area with soil anomalies is at least 2km^2, with 50 soil samples showing lithium values above 200 ppm.

Within this anomalous area, Oceana geologists have observed at least 17 pegmatite bodies with average width of up to 30m and strike lengths from 200m up to 400m. These bodies are oriented in the NNE-SSW direction on a similar trend to BJdB, located about 3 km to the NE of Nira.

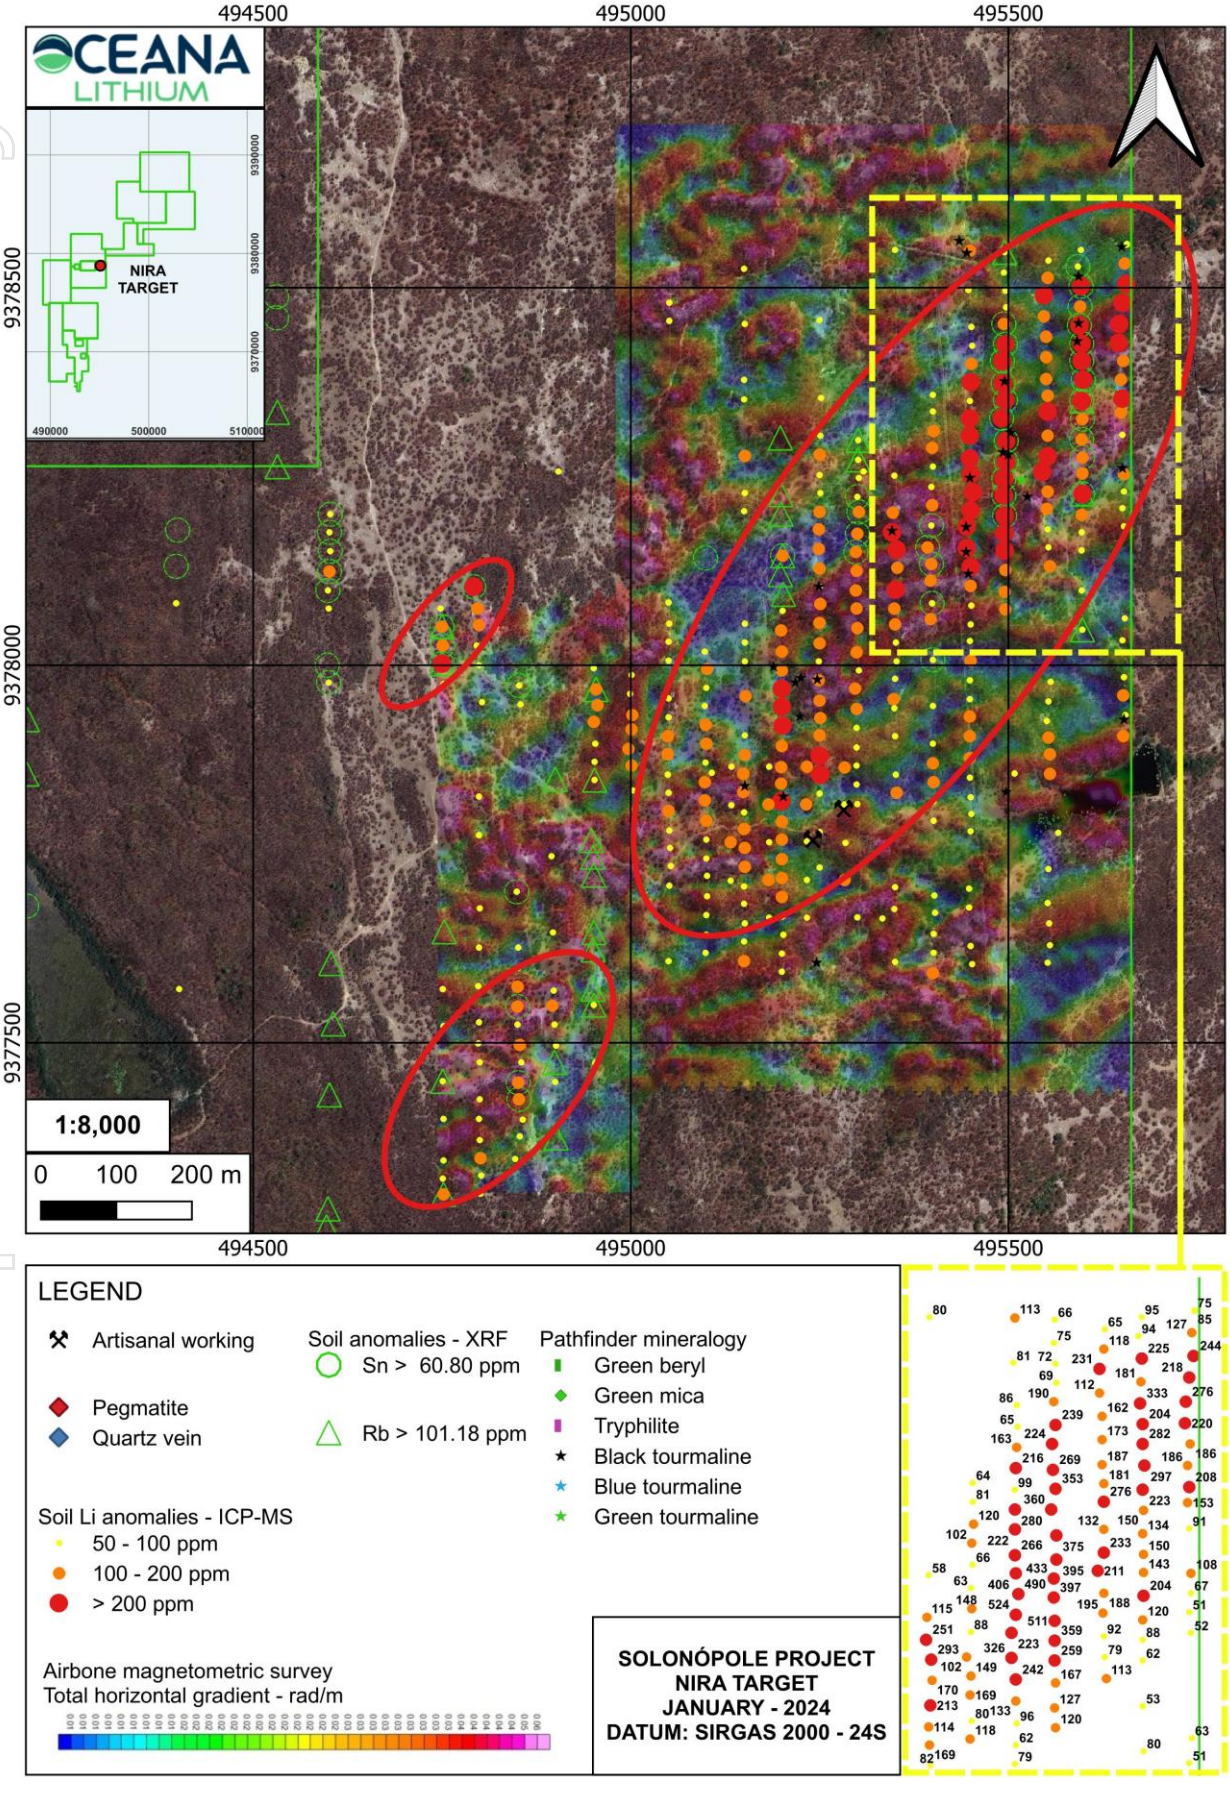

Figure 3: *Nira Target - Integrated Map and Main Results*

3) Lapinha Target

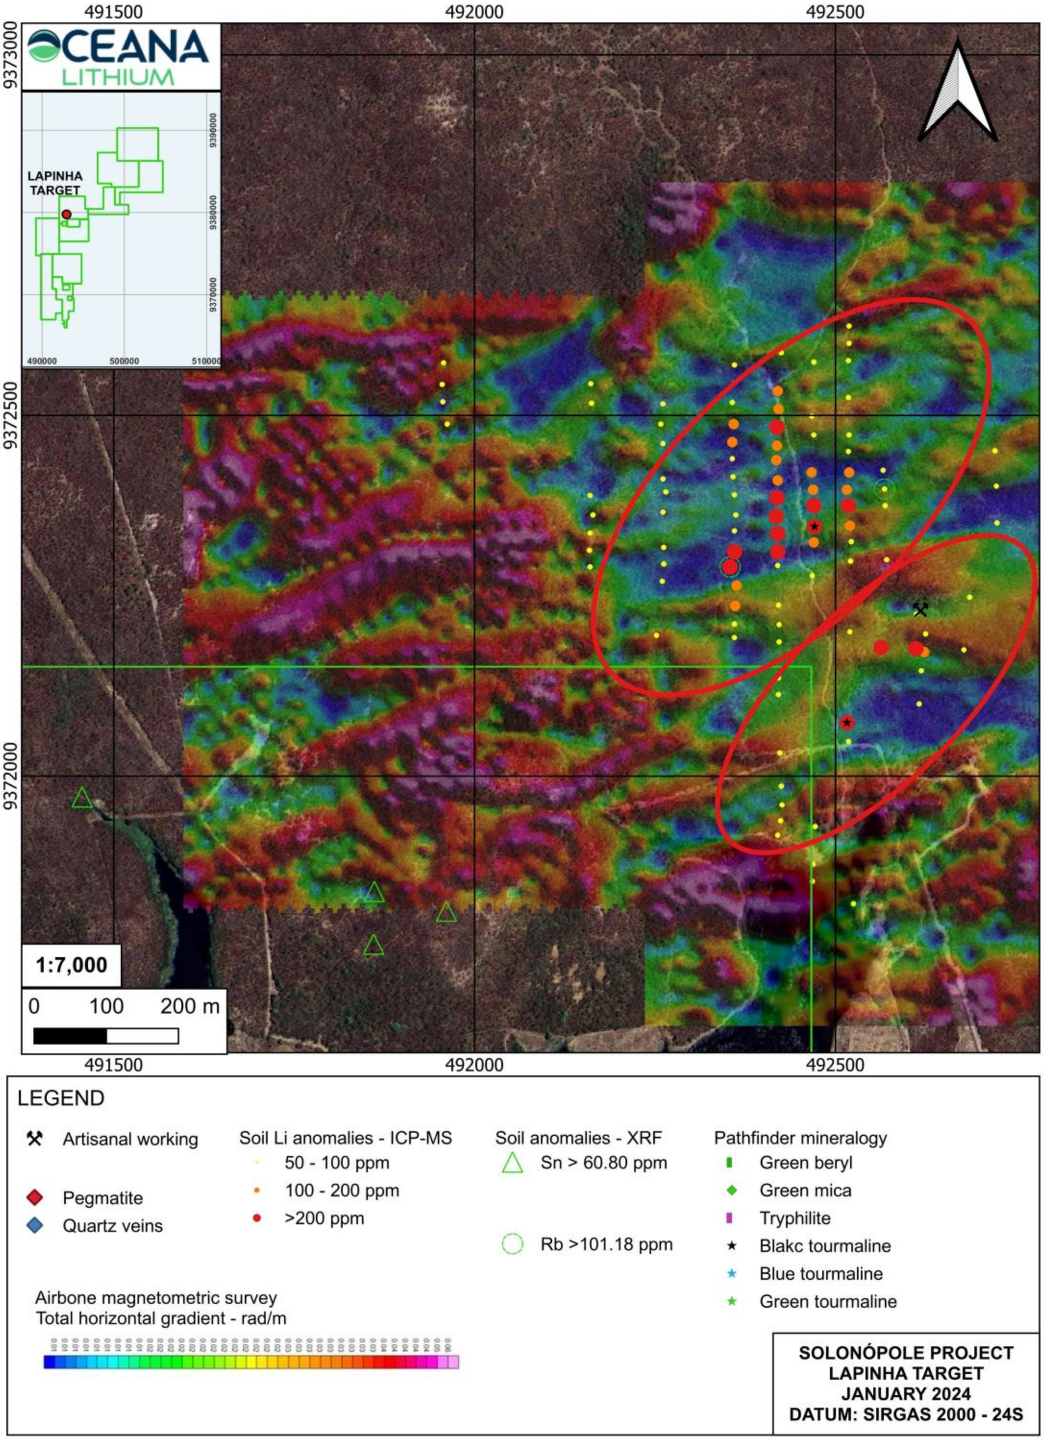

Figure 4: *Lapinha Target - Integrated Map and Main Results*

Lapinha is evolving as an exploration target. A total of 88 soil samples have been analysed to date, with 27 samples showing lithium anomalous results exceeding 100 ppm. Out of these 27 samples, 15 samples surpass 200 ppm, with the highest anomaly reaching 419 ppm. These anomalies have been interpreted as two parallel structures covering an area of over 1km^2 oriented in the NE-SW direction. Oceana geologists have identified at least 11 pegmatite bodies with dimensions ranging from 225 to 425 meters length and 10 to 25 meters width, oriented in the ENE-WSW direction, as indicated by soil geochemistry, geophysics and geological mapping data.

4) Urubu Target

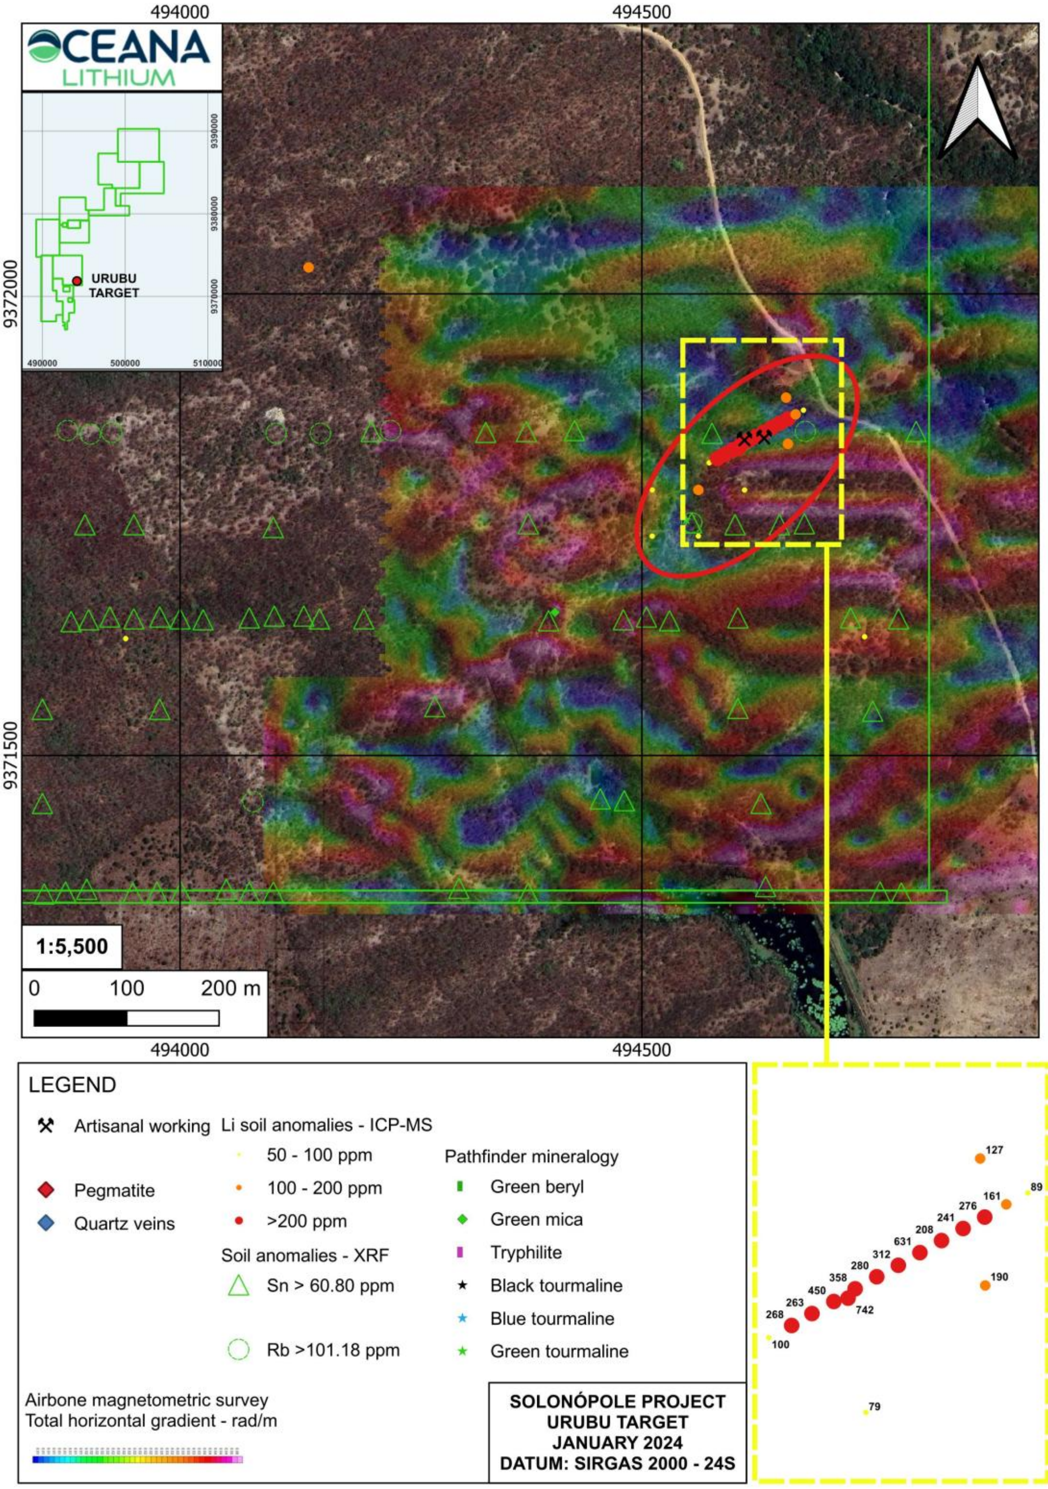

Figure 5: *Urubu Target - Integrated Map and Main Results*

A total of 22 soil samples were collected at Urubu, of which 17 are located within 5m of the main pegmatite body which strikes in a NE-SW direction. Out of these 17 samples, 14 show lithium anomalous results greater than 100 ppm, and 11 of them exceed 200 ppm. Notably, five samples have lithium values ranging from 300 ppm to 742 ppm. The main body outcrops over a length of 160m, with a width of approximately 20m, oriented in the NE-SW direction.

5) Zilcar II Target

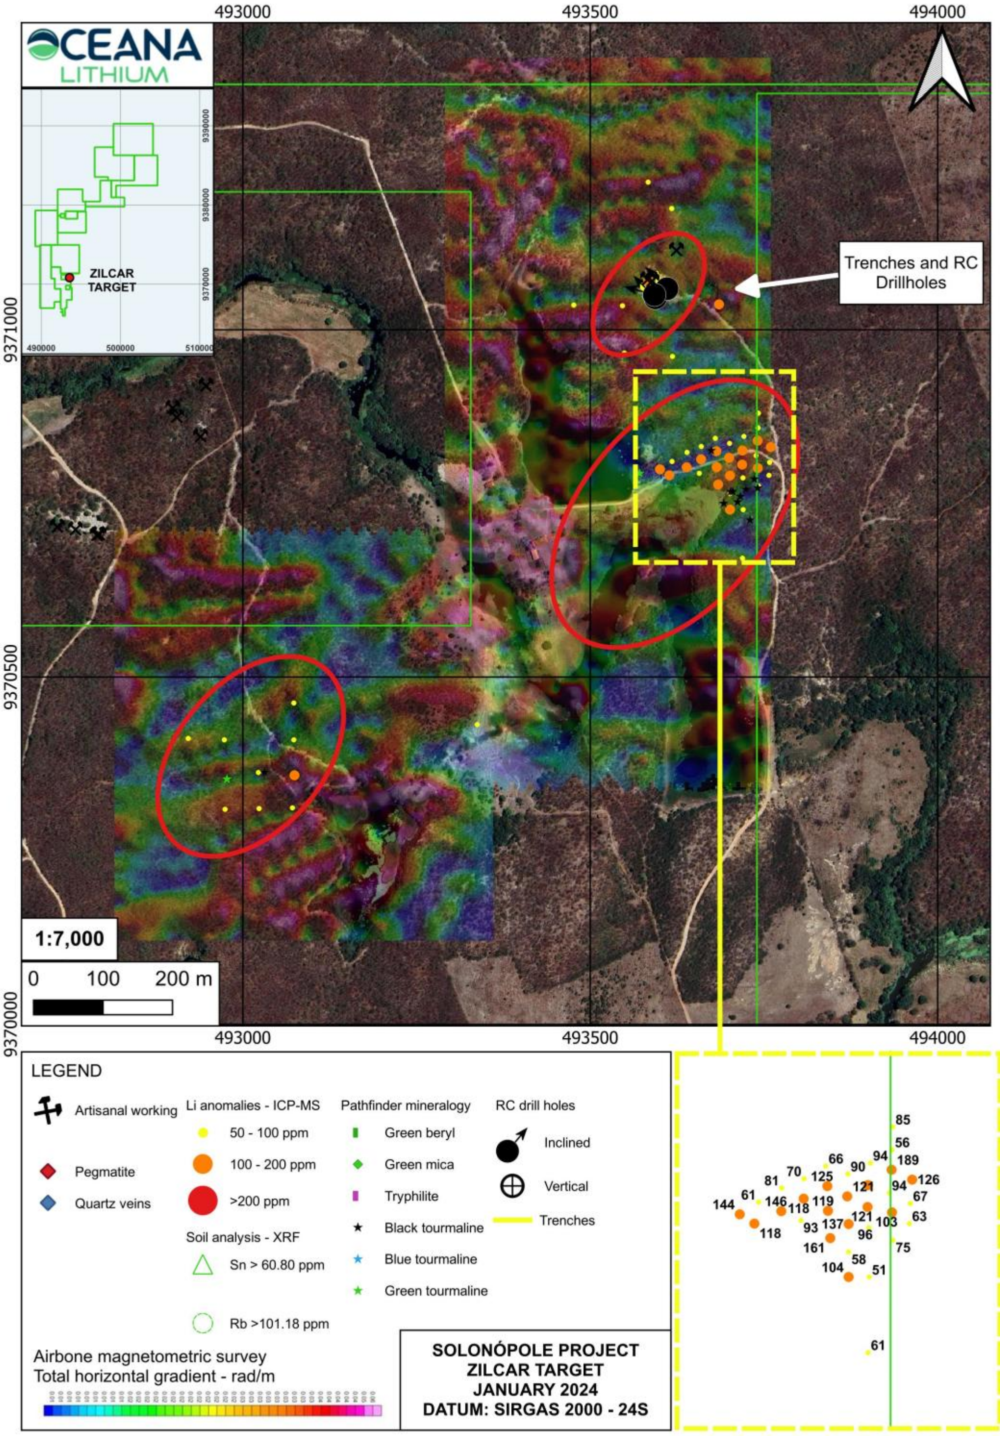

***Figure 6:** Zilcar II Target - Integrated Map and Main Results*

The Zilcar II target is located within the Soledade West Prospect (Permit 800238) and consists of an old pit from which Li-bearing grab-samples were taken by previous tenement owner Cougar Metals Ltd in 2017-18. Amblygonite samples returned up to 9.29% Li_2O and 17.32% P (refer to ASX Announcement dated 7 August 2023). A total of 3 drill holes (212m total) and two trenches (SOL-TR-004 and SOL-TR-005) were completed across the old pit area situated ~150m to the north-west of the soil-grid. The best drill hole intercepts were from SOL-RC-008, with maximum value over 1m of 0.95% Li_2O from 52m to 53m.

A Lithium mineralised zone exists from 46m to 53m (7m not true width) averaging 0.49% Li_2O, including 3m at 0.69% Li_2O. The geochemical assay signatures (high P) indicate that the lithium-bearing mineral is probably amblygonite. XRD analysis will be undertaken in the coming months to confirm this observation.

A total of 17 soil samples (out of 48 soil samples from Zilcar II) returned lithium anomalies above 100 ppm (up to 189 ppm). There are at least 11 pegmatite bodies with 150-250m in length and 10-20m in thickness striking ENE-WSW.

6) Rolados Target

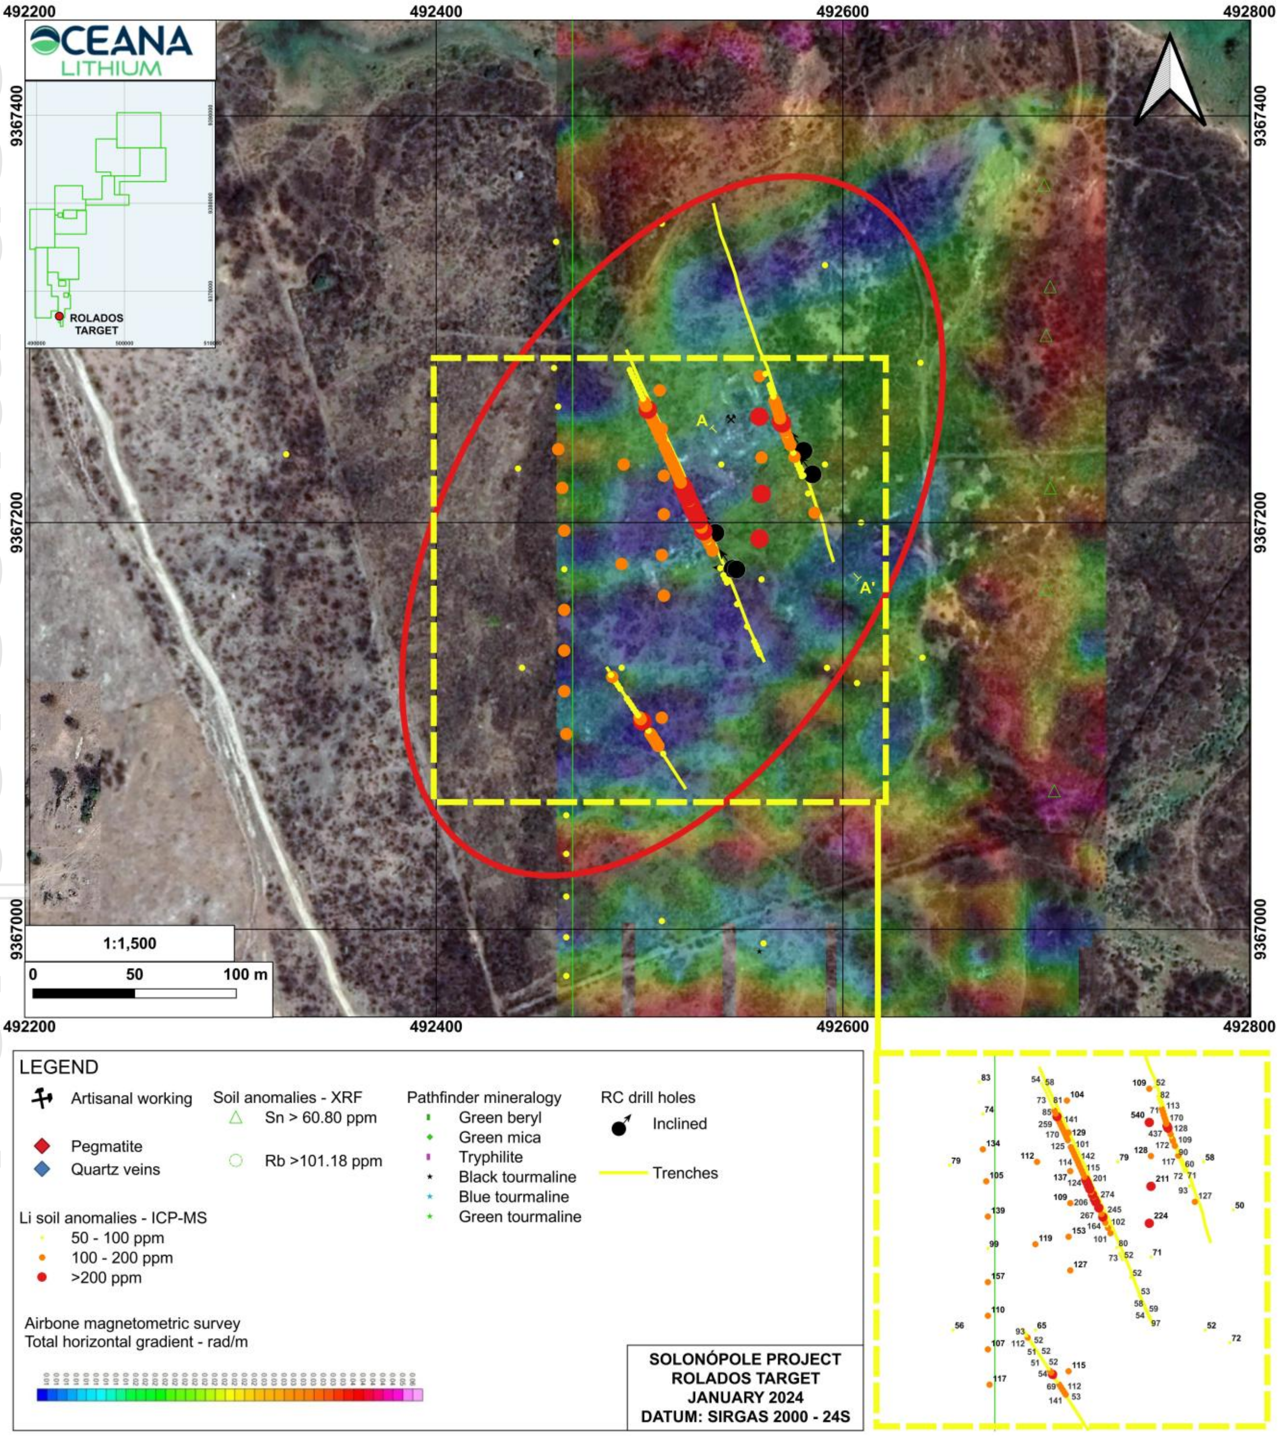

Figure 7: *Rolados Target - Integrated Map and Main Results*

At the **Rolados Target**, three trenches were completed on a portion of the anomaly (SOL-TR-001 to SOL-TR-003), and several samples have returned lithium results above 100 ppm. Final results from shallow scout RC drilling also returned anomalous lithium values at three drill holes (SOL-RC-001, SOL-RC-002 and SOL-RC-005). The best intercepts include:

- Rolados: SOL-RC-001, with anomalous lithium values from 43m to 44m (1m not true width) averaging 0.26% Li_2O. This hole is proximal to mapped pegmatites and trench samples with lithium values above 200 ppm.
- Rolados: SOL-RC-002, with anomalous lithium values from 11m to 12m (1m not true width) averaging 0.28% Li_2O. This hole is also less than 50m to mapped pegmatites and trench samples with lithium values above 200 ppm.
- Rolados: SOL-RC-005, with anomalous lithium values from 44m to 47m (3m not true width) averaging 0.23% Li_2O, including 1m at 0.29% Li_2O. Located only a few meters away from SOL-RC-002.

At this stage the source of the Li anomalism in the chips is uncertain. XRD will be undertaken in the coming months to confirm the mineralogy of the likely mineralization.

A total of 21 soil samples (out of 38 soil samples collected at Rolados) presented lithium anomalies exceeding 100 pm (up to 524 ppm). There are at least 8 pegmatite bodies, ranging from 70 to 160m in strike length and 5 to 10m in thickness striking ENE-WSW.

Next Steps

Geological mapping and soil sampling activities have resumed on site following the year-end holiday season. These activities are targeting the tenements located in the northern part of the project.

Subject to weather conditions, additional trenching is also being planned for some of these high priority areas, particularly where soil samples returned significant lithium anomalous values.

Preliminary geological modelling and interpretation is progressing to support planning activities for a follow-up diamond drilling campaign over certain high priority areas.

Changes in Exploration Team

Oceana is pleased to advise of the appointment of Mr. Mike Macedo Sousa, a resident of Brazil as Exploration Manager and Competent Person (JORC Code), effective from 19 February 2024. Mike is an accomplished senior geologist and experienced project development manager with previous experience in battery minerals exploration including lithium, nickel and cobalt. He is a Member and Chartered Professional (Geology) with the Australian Institute of Mining and Metallurgy (AusIMM). He has worked with juniors and majors alike in various geological terranes in many countries including Brazil, Peru, Sweden and various parts of Africa.

With the appointment of the new Exploration Manager and Competent Person in Brazil, Mr Renato Braz Sue and Mr James Abson will step down from their respective roles as Exploration Manager and Senior Exploration Manager / Competent Person. However, they will continue as technical consultants and Oceana acknowledges the valuable contribution made by Mr Sue and Mr Abson to date.

Cautionary Statement

The Company notes that the logging results are provisional, with RC chips being very difficult to visually log accurately, especially individual mineral species. Pegmatites have several white to grey to green minerals, including spodumene, albite, quartz, feldspars, beryl and sometimes others. The Company's geologists are logging pegmatite only when the presence of pegmatitic minerals is obvious. At this stage the pegmatites logged as such contain varying abundances of typical LCT pegmatite non-Li-bearing minerals, predominantly feldspar, quartz, muscovite mica and accessory tourmaline.

Only the BJdB Pit, BJdB Central, Tin Mine, Rolados, and the Zilcar II pegmatites can be described as LCT pegmatites at this stage, but their Li mineral abundances are yet to be determined. Investors should note that while LCT pegmatites are a known host for accessory Lithium bearing minerals such as spodumene, it is also known that this is not a universal association. Visual observations of the presence of rock or mineral types and abundance should never be considered a proxy or substitute for petrography and laboratory analyses where mineral types, concentrations or grades are the factor of principal economic interest. Visual observations and estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations.

Further analysis (UV-lamp, XRF, XRD and ICP assay) will further refine the logging, and thus the logs will be subject to change. At this stage it is too early for the Company to make a determinative view on the abundance of any of these minerals. These abundances will be determined more accurately through petrography, assay, and XRD analysis. The reported widths mentioned in this release are downhole and no estimate of true width is given. True widths will be determined once infill drilling has occurred and detailed 3D modelling completed. Reported intercepts are thus likely to decrease with 3D modelling. Further, no forecast is made of whether this or further drilling will deliver ore grade intersections, Mineral Resources or Ore Reserves. The observed presence of pegmatite does not necessarily equate to Lithium mineralisation until confirmed by chemical analysis which is currently underway. It is not possible to estimate the concentration of mineralisation by visual estimation and this will be determined by chemical analysis and XRD.

Authorised for release by the Board of Oceana Lithium Ltd.

Competent Person Statement

The information in this announcement that relates to exploration results is based on information reviewed, collated and fairly represented by Mr James Piers Abson who is a Member of South African Council for Natural Scientific Professions (SACNASP; "Recognised Professional Organisation"; Registration No. 400108/09; Professional Natural Scientist Geological Science) to Oceana Lithium Ltd. Mr Abson has visited the Solonópole project area on numerous occasions and all the current drilling sites and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration, and to the activity which has been undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Abson consents to the inclusion in this report of the matters based on this information in the form and context in which it appears. Mr Abson confirms information in this market announcement is an accurate representation of the available data for the exploration areas being acquired.

About Oceana Lithium

Oceana Lithium Limited is a mineral exploration and development company with advanced + early-stage Lithium exploration projects in prime mining jurisdictions in Brazil and Australia.

Oceana's Chief Executive is Brazilian born and educated Caue Araujo who has wide industry experience in mining project development, including critical minerals. Having had his early training as a geologist with Vale in Brazil, Caue has a practical understanding of local operating conditions including social and cultural sensitivities and corporate and compliance challenges that must be respected to successfully operate in Brazil. Non-Executive Director Simon Mottram, a widely experienced geologist resident in Brazil who is also fluent in Portuguese, provides additional local knowledge and support to the Company's Brazil exploration team. Non-Executive Director Dr Qingtao Zeng provides oversight of the Company's exploration effort at the Napperby project in the Northern Territory. The Board is rounded out by Chair Mr Gino Vitale who has over 30 years of international mining, project development and corporate management experience across a number of commodities.

Note: OCN notes the intrinsic level of uncertainty around grades due to possible downhole contamination (smearing) of Lithium by Reverse Circulation drilling. Care should be taken when interpreting these results. The widths observed at drill holes and mentioned herein are downhole widths; true widths to be confirmed with further drilling and detailed 3D modelling. The Company notes that visual observations of the presence of rock or mineral types and abundance should never be considered a proxy or substitute for petrography and laboratory analyses where mineral types, concentrations or grades are the factor of principal economic interest. Visual observations and estimates also potentially provide no information regarding impurities or deleterious physical properties relevant to valuations. Readers are also referred to Cautionary Note on page 11.

APPENDIX 2

1 JORC CODE, 2012 EDITION – TABLE 1

1.1 Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• Drill hole collars taken with hand-held GPS (Garmin eTrex) as provisional readings. Before 3D modelling positions are refined with DGPS coupled with DTM (captured by RTK-enabled drone). • Photographs of field RC logging mats photographed (with hole ID and downhole metres). • X10 and x20 magnification loupes used during logging. • Obvious, purple-coloured mica identified as lepidolite. • Accurate & representative logging of pegmatite RC chips is difficult due to fine particle size, similar colours (grey/white), and preferential fine destruction of certain minerals, especially within the surface weathered zone. All other minerals identified pending confirmation from assay results and further petrography or XRD as required. • Entire 1m interval sack of RC chips collected from cyclone passed through 3-stage riffle splitter there (x3) times, then coned and quartered for further sampling (XRF; SGS; duplicate; balance stored). • Chip trays filled with large +2mm washed chips from one (x1) riffled quarter (using a sieve). • Photograph taken of each chip tray (labelled with drill ID and downhole metres). • UV-lamp used to identify spodumene in washed chips (orange-pink fluorescence). • XRF (hand-held Niton, calibrated to AMIS standards), to be used to assay for Li-pathfinders (Cs, Ta etc. Guide only - not to be used in any resource statement). • Approximately 100g of -0.5mm screened chips/dust sent for XRF analysis. • Approximately 1kg of split RC chips (all fractions) sent to SGS Geosol (Minas Gerais State, Brazil). • The ICP90A method used to assay for Li, Ta,

Criteria	JORC Code explanation	Commentary
		Sn, and other elements (see https://www.sgsgeosol.com.br/servicos/geoquimico/). • Randomly spaced reconnaissance grab hand-specimens and rock chip samples taken from within quarries, from outcrops, and from trenches, along strike of a known pegmatite outcrops. • 2022/2023 sampling aided with hand-held GPS (Garmin eTrex). • Prior to 2022 no GPS used. • Obvious, purple-coloured micaceous rocks identified as lepidolite. • White rocks of interest sampled assumed to be Li-bearing (possible spodumene and/or amblygonite) but pending confirmation from assay results and further petrography if required. • Approximately 1-2kg of rock was sent to SGS Geosol (Minas Gerais State, Brazil). • The ICP90A method was used to assay for Li, Ta, Sn, and other elements (see https://www.sgsgeosol.com.br/servicos/geoquimico/).
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• RC (reverse circulation) drilling (5.5” hammer). • Downhole survey tool used when hole angled (off vertical) and greater than 60m deep. • RC samples collected at drill cyclone (entire metre).
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• Chip recoveries estimated using expected hole volume per metre multiplied by a fixed assumed density (2.65). • Riffle splitting (3-tier splitter) the sample three (x3) times & then further mixing and cone & quartering is used to ensure representative sampling. • No assays have been received to check recovery induced sampling bias.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.*	• Provisional logging only. Detailed logging in progress (UV-lamp; XRF; XRD; etc.). • Photographs of all field RC logging mats and RC chip trays taken.

Criteria	JORC Code explanation	Commentary
	• *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• RC chips sun dried if wet. • Riffle splitting (3-tier splitter) the sample three (x3) times & then further mixing and cone & quartering is used to ensure representative sampling. • This sampling and splitting technique is appropriate for RC samples. • Blanks, standards, duplicates are to be inserted into the sample run (totalling 15%) for QA/QC purposes. An umpire lab will be used to verify additional 5% of anomalous Li results. • QA/QC failures are repeated by SGS as per SOP. • No resource reported so no full QA/QC report carried out to date.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• XRF (hand-held Niton, calibrated to AMIS standards), to be used to assay for Li-pathfinders (Cs, Ta etc. Guide only - not to be used in any resource statement). • SGS Geosol and accredited laboratory for Li to be used; • The ICP90A method was used to assay for Li, Ta, Sn, and other elements (see https://www.sgsgeosol.com.br/servicos/geoquimico/). • The lab used its own internal blanks and duplicates. • Blanks, standards, duplicates are to be inserted into the sample run (totaling 15%) for QA/QC purposes. An umpire lab will be used to verify additional 5% of anomalous Li results. • QA/QC failures are repeated by SGS as per SOP. • No resource reported so no full QA/QC report carried out to date. • Random reconnaissance grab and rock chip samples were taken. • They are not representative of the entire body sampled and are only used to indicate the presence and type of Li mineralisation at an

Criteria	JORC Code explanation	Commentary
		early stage.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• Independent CP peer review. Audit undertaken. No report received to date. • Li ppm to be converted to Li_2O % (converted to wt. % then multiplied by 2.153). • All logged drill data entered in company database (MX Deposit). Independent CP to audit database quarterly. Hard-copy paper records filed. Audit undertaken. No report received to date. • The Company was not able to independently verify the Cougar 2017/2018 samples in the field, nor their rock-type, nor the exact sample locations, nor their assays.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Drill hole collars taken with hand-held GPS (Garmin eTrex) as provisional readings. Before 3D modelling positions are refined with DGPS coupled with DTM (captured by RTK-enabled drone). • WGS-84 24 S used. • Hand-held GPS positions (+- 3m) adequate for reconnaissance grab sampling.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• RC scout drilling only (20m to 40m centres). • Current data not suitable for resource reporting. • No compositing has been applied. • Random grab sampling for indicative Li mineralisation purposes only.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• RC drill assay results received. • No 3D modelling carried out to date. • Random grab sampling for indicative Li mineralisation purposes only. • New geophysics data has identified structural trends which will assist in the better design of drilling and sampling campaigns.
Sample security	• *The measures taken to ensure sample security.*	• Chain of command logs filed from RC drill on site; for sample bags transported to field office; for samples split and stored (locked container); for samples sent to SGS Geosol. • All Oceana samples are taken in the field, and

Criteria	JORC Code explanation	Commentary
		then transported to and prepared by Oceana staff at the secured Oceana field base in Solonópole, and then entered in Oceana's Database (MX Deposit). A batch no. is assigned to the samples, which are sealed in a box, and sent by courier to SGS Geosol, which then assigns the batch their lab number (also captured in Oceana's Database). • Duplicate samples, standards, and blanks, are stored in a locked storeroom at the secured Oceana field base in Solonópole.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• An audit was carried out by an Independent CP. No report received to date.

1.2 Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• 100% beneficially owned by Oceana subsidiary Ceará Litio Mineração Ltda.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Sampling carried out by N Green. Random grab sampling for indicative Li mineralisation purposes only. Oceana has no reason not to trust the sampling positions, method, or results provided.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• LCT pegmatite intrusion.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* o *easting and northing of the drill hole collar* o *elevation or RL (Reduced Level – elevation above sea level in metres)*	• Provided.

Criteria	JORC Code explanation	Commentary
	of the drill hole collar ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• RC drilling assay results received, and no 3D modelling or other resource related calculations yet undertaken. • Simple averaging of anomalous (>0.20% Li_2O) Li grades for downhole intercepts was used for exploration result reporting. • These mineralized intercepts are not true widths.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• RC drilling assay results received, and no 3D modelling or other resource related calculations yet undertaken. • True widths not known at this stage until 3D modelling completed.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Drill map and provisional logs and provisional sections provided.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low*	• RC drilling assay results received, and no 3D modelling or other resource related

Criteria	JORC Code explanation	Commentary
	and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	calculations yet undertaken.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• Due to this project being early Greenfields exploration in nature, other than the minimal historic information and N Green exploration data available, and reported above, there is no other meaningful or material exploration data available for this project at this stage. Oceana has commenced first pass scout RC drilling and systematic and phased exploration of these project areas, which will improve the geological and economic understanding of these areas. New meaningful and material data will be reported on as it becomes available.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive*	• The next phases of work will include additional drone LIDAR surveys; accurate surface geological mapping and sampling; geophysics (probably magnetics and radiometrics), possible satellite hyper-spectral data analysis, soil sampling, trenching and mapping & channel sampling, as well as various results driven campaigns of RC and core drilling.
