Renascor Awarded $5m Government Grant

Australian critical minerals grant to co-fund Purified Spherical Graphite demonstration facility

- Renascor Resources has been awarded a $5 million grant under the Australian Government's International Partnerships in Critical Minerals Program for its planned vertically integrated Battery Anode Material graphite mine and manufacturing operation in South Australia (**BAM Project**).
- The grant has been awarded to Renascor to co-fund up to 49.9% of the capital cost of a $10 million demonstration processing plant that will produce battery-grade Purified Spherical Graphite (**PSG**) for use in lithium-ion battery anodes.
- Renascor's grant application was supported by South Korean conglomerate POSCO International and Japanese trading company Hanwa Co. Ltd. Renascor has previously entered into non-binding offtake agreements with both POSCO and Hanwa Co. Ltd[1].
- The PSG demonstration facility, which will process Graphite Concentrates from Renascor's 100%-owned Siviour Graphite Deposit in South Australia, will incorporate previously completed design work undertaken as part of Renascor's definitive feasibility level Battery Anode Material Study completed in August 2023[2] and is intended to demonstrate the commercial viability of Renascor's eco-friendly, hydrofluoric acid-free PSG process[3].
- Renascor is currently progressing a competitive Early Contractor Involvement (**ECI**) process for its proposed Siviour Mine and Concentrator, the upstream portion of the BAM Project, as part of its strategy to first accelerate the production of Graphite Concentrates prior to producing PSG as the first ex-China integrated producer of PSG for lithium-ion battery anodes.
- In parallel with the ECI works on the upstream, Renascor is in discussions with lithium-ion battery market participants regarding both potential binding offtake terms, as well as potential equity investments to help meet the BAM Project's initial capital requirements.

Renascor Resources Limited (ASX: RNU) (**Renascor**) is pleased to announce that it has been awarded a $5million grant under the Australian Government's International Partnerships in Critical Minerals Program.

The grant has been awarded to Renascor to co-fund up to 49.9% of the capital cost of a $10 million demonstration processing plant that will produce battery-grade Purified Spherical Graphite (**PSG**) for use in lithium-ion battery anodes.

Commenting on the grant award, Renascor Managing Director David Christensen stated:

> *"The award of this grant recognises the strategic significance of the Siviour Battery Anode Material Project and its potential to become a long-term producer of Purified Spherical Graphite for the lithium-ion battery sector.*
>
> *With this grant funding, we will now be able to build upon the significant work already completed on our downstream processing designs and further demonstrate that our eco-friendly, Hf-free purification technology can deliver a globally competitive PSG production operation.*
>
> *Renascor thanks both the Australian Government and our international partners, POSCO International and Hanwa Co Ltd. for their support in helping to unlock critical minerals processing capability in Australia."*

Discussion

The award of the $5 million grant is part of the Australian Government's International Partnerships in Critical Minerals Program, which is intended to support critical minerals projects that contribute to building end-to-end supply chains with Australia's international partners in the critical minerals sector.

The grant awarded to Renascor will co-fund up to 49.9% of the capital cost of a $10 million demonstration processing plant that will produce battery-grade Purified Spherical Graphite (**PSG**) for use in lithium-ion battery anodes.

The PSG demonstration facility, which will process Graphite Concentrates from Renascor's 100%-owned Siviour Graphite Deposit in South Australia, will incorporate previously completed design work undertaken as part of Renascor's definitive feasibility-level Battery Anode Material Study completed in August 2023[4], including mechanical shaping, purification and water treatment circuits.

The plant will permit continuous production, designed to test, demonstrate and optimise the flowsheet parameters prior to detailed design and construction of the planned commercial facility.

Renascor intends to commence procurement of plant equipment in the current quarter, with commissioning planned for Q2 2025.

This ASX announcement has been approved by Renascor's Board of Directors and authorised for release by Renascor's Managing Director David Christensen.

Appendix 1

About Renascor

Renascor is developing a vertically integrated Battery Anode Material Manufacturing Operation ("**the Project**") in South Australia. The Project comprises:

- **the Siviour Graphite Deposit** - the world's second largest Proven Reserve of Graphite and the largest Graphite Reserve outside of Africa[5];
- **the Siviour Graphite Mine and Concentrator** - a conventional open-pit mine and crush, grind, float processing circuit delivering world-class operating costs in large part due to the favourable geology and geometry of Renascor's Siviour Graphite Deposit; and
- **a Battery Anode Material Production Facility** - where Graphite concentrate will be converted to PSG using an eco-friendly processing method before being exported to lithium-ion battery anode manufacturers.

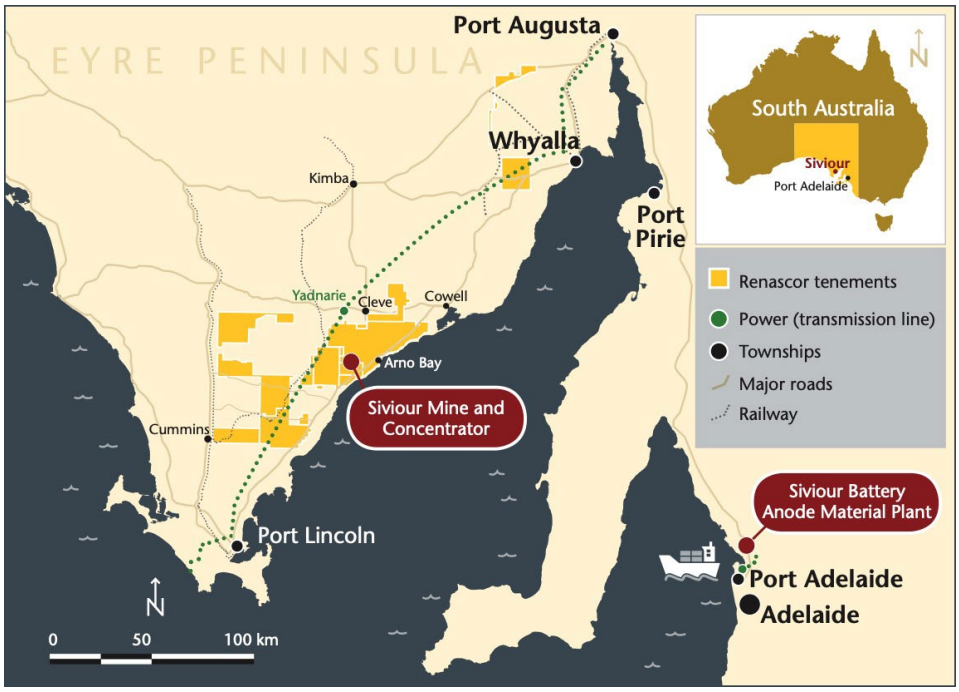

Figure 1. Siviour Battery Anode Material Project location.

The 100% Renascor owned Siviour Graphite deposit is unique in both its near-surface, flat-lying orientation and its scale as one of the world's largest graphite Reserves. The favourable geology and size of the deposit will allow Renascor to produce Graphite Concentrate at a low-cost over a 40-year mine life.

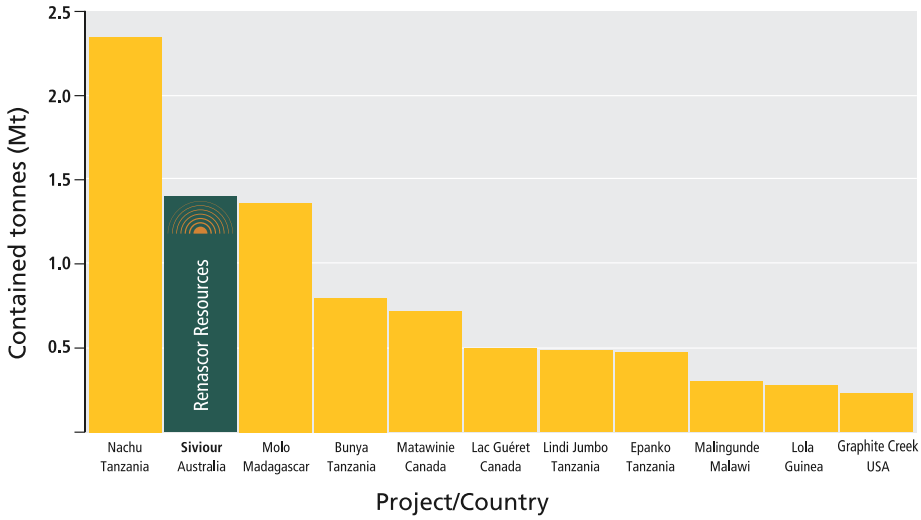

Figure 2. Globally Reported Proven Ore Reserve estimates (September 2023)[6]

Renascor intends to leverage this inherent advantage and develop a vertically integrated operation to manufacture high value PSG from a low-cost graphite concentrate feedstock and provide a secure cost-competitive supply of battery anode raw material into the rapidly growing lithium-ion battery market.
