

RED MOUNTAIN LITHIUM DISCOVERY BOLSTERED WITHMORE OUTSTANDING THICK INTERSECTIONS

Second batch of assays delivers further high-grade intersections

Key Highlights

- Multiple lithium intersections reported in assay results for the next four holes, RMRC004-007, with intersections up to +80m thickness, including:
- RMRC004: 83.8m @ 1,230ppm Li from 16.8m.
- RMRC005: 80.8m @ 1,270ppm Li from 56.4m
- RMRC006: 62.5m @ 1,070ppm Li from 6.1m and 70.1m @ 1,090ppm Li from 89.9m
- RMRC007: 74.7m @ 1,160ppm Li from 18.3m
- Intersections sit mid-project within 4.6km of strike length drilled to date at Red Mountain.
- Assay results for the remaining four drill holes expected in late July.

Astute Metals NL (ASX: ASE) ("ASE", "Astute" or "the Company") is pleased to advise that assay results from the next four holes, RMRC004-007, of the inaugural Reverse Circulation (RC) drilling campaign at its 100%-owned Red Mountain Lithium Project in Nevada, USA, have returned high-grade mineralisation. Assay results from the second batch of samples include the following drill intersections:

• RMRC004 : 13.7m @ 1,070ppm Li / 0.57% Lithium Carbonate Equivalent¹ (LCE) from surface

83.8m @ 1,230ppm Li / 0.65% LCE from 16.8m

• RMRC005 : 26.0m @ 656ppm Li / 0.35% LCE from 3.0m

80.8m @ 1,270ppm Li / 0.68% LCE from 56.4m to End of Hole

• RMRC006 : 62.5m @ 1,070ppm Li / 0.57% LCE from 6.1m

15.3m @ 896ppm Li / 0.48% LCE from 71.6m

70.1m @ 1,090ppm Li / 0.58% LCE from 89.9m

• RMRC007 : 74.7m @ 1,160ppm Li / 0.61% LCE from 18.3m

25.9m @ 1,580ppm Li / 0.84% LCE from 115.8m

This second batch of assays, from drill holes located centrally within the group drilled so far (Figure 1), demonstrate thicker intersections than those previously announced, with all four holes intersecting +70m zones grading over 1,000ppm lithium. These outstanding results indicate the scale and grade potential at Red Mountain, as it continues to emerge as a project of significance in North America. Assays for the final four holes from the campaign are expected to be received later this month, which, along with other results, will allow the Company to determine the next steps at this highly prospective Project.

Astute Chairman, Tony Leibowitz, said:

"Our confidence in the scale and significance of this discovery continues to increase with each successful drill-hole at Red Mountain. Assays from the latest four holes have exceeded expectations and returned some very thick, high-grade intercepts which have confirmed robust lithium mineralisation in the middle of the project, between intersections from the discovery holes.

"With final assay results expected for the remaining four holes shortly, data from all holes will then be integrated into an updated geological model for Red Mountain with a view to expediting the process to achieving a maiden Mineral Resource Estimate."

About Lithium Carbonate Equivalent (LCE)

Unlike spodumene concentrate, which is a feedstock for a value-added battery product, Lithium Carbonate is a principal lithium-ion battery product, which may be used directly in battery production or converted to other battery products such as lithium hydroxide. The Benchmark Mineral Intelligence Lithium Carbonate China Index priced lithium carbonate product at US $13,710/t^6$ as of 12 June 2024.

Lithium carbonate is the product of many of the most advanced lithium clay projects around the world, including Lithium Americas' (NYSE: LAC) 16.1Mt LCE Thacker Pass Project³, which is currently under construction. Accordingly, exploration results for Red Mountain have been reported as both the standard parts-per-million (ppm) and as % Lithium Carbonate Equivalent (LCE). A full table of assay results is provided in Appendix 2.

| Drill Hole ID | Easting (NAD83) | Northing (NAD83) | RL (m) | Dip (°) | Azimuth (°) | Depth Drilled (m) |

Table 1. Drill hole collar details

Background

Located in central-eastern Nevada (Figure 2), the Red Mountain Project was staked by Astute in August 2023.

The Project area has broad mapped tertiary lacustrine (lake) sedimentary rocks known locally as the Horse Camp Formation². Elsewhere in the state of Nevada, equivalent rocks host large lithium deposits (see Figure 2) such as Lithium Americas' (NYSE: LAC) 16.1Mt LCE Thacker Pass Project³, American Battery Technology Corporation's (OTCMKTS: ABML) 15.8Mt LCE Tonopah Flats deposit⁴ and American Lithium (TSX.V: LI) 9.79Mt LCE TLC Lithium Project⁵.

After staking was completed, Astute completed an 819-point soil sampling campaign that revealed strong lithium anomalism in soils, with grades of up to 1,110ppm lithium and a coherent 50ppm+ anomaly that stretched over 8km strike and up to 2.8km width² (Figure 1).

Rock chip sampling, undertaken in several campaigns, revealed the presence of strongly mineralised claystone, grades of up to 4,150ppm lithium⁸. As a relatively soft rock type, the claystones at Red Mountain are 'recessive', or lie beneath a typically thin veneer of alluvium.

This recessive nature of the claystone means that more claystone may be present than is immediately apparent, with the harder rock types presenting as outcrop and the claystone being hidden.

A total of 11 holes were drilled for a combined 1,518m as part of the maiden RC drilling campaign, which targeted lithium clay mineralisation in zones of strong soil anomalism and/or rock chip anomalism with a view to understanding the thickness and grade potential of the project (Table 1 and Figure 1).

Results received to date from the campaign confirm the discovery of sub-surface lithium mineralisation over a broad 4.6km strike length at Red Mountain.

Other attractive Project characteristics include the presence of outcropping claystone host-rocks and close proximity to infrastructure, including the Project being immediately adjacent to the Grand Army of the Republic Highway (Route 6), which links the regional cities of Ely with Tonopah.

Next Steps

The Company is awaiting outstanding assay results for the remaining four drill holes (RMRC008-011) completed as part of the maiden drill campaign at Red Mountain. Once received, a full interpretation will be conducted ahead of establishing detailed future plans for the Project.

Competent Persons

The information in this report that relates to Sampling Techniques and Data (Section 1) is based on information compiled by Mr. Matthew Healy, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy (AusIMM Member number 303597). Mr. Healy is a full-time employee of Astute Metals NL and is eligible to participate in a Loan Funded Share incentive plan of the Company. Mr. Healy has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Healy consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to Reporting of Exploration Results (Section 2) is based on information compiled by Mr. Richard Newport, principal partner of Richard Newport & Associates – Consultant Geoscientists. Mr. Newport is a member of the Australian Institute of Geoscientists and has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person under the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Newport consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

Section 1 - Sampling Techniques and Data

| Criteria | JORC Code explanation | Commentary |
|--------------------------|--|--|
| Sampling techniques | Nature and quality of sampling (e.g. cut channels, random chips, or specific specialisedindustry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheldXRF instruments, etc.). These examples should not be taken as | 5.5" reverse circulation drilling was undertaken for drill sample collection. Samples were collected on a 5-foot basis in calico bags, with a 50% split retained from a rotary cone splitter for lab assay. Nominal small drill sample was collected for chip |
| \bigcirc | limiting the broad meaning of sampling. | tray records |
| | Include reference to measures taken to ensuresample representivity and the appropriate calibration of any measurement tools or systems used. | Samples were air dried on elevated grid mesh until practical to transport |
| | Aspects of the determination of mineralisation ta are Material to the Public Report. | Claystone hosted lithium deposits are thought to form as a result of the weathering of lithium-bearing volcanic glass within tertiary-aged tuffaceous lacustrine sediments of the mapped Ts3 unit. Inputs of lithium from |
| | In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, suchas where there is coarse gold that has inherentsampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. | geothermal sources have also been proposed. |
| Drilling techniques | Drill type (e.g. core, reverse circulation, open- holehammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core isoriented and if so, by what method, etc.). | 5.5" reverse circulation drilling methods employed. Water was injected to assist with transport of sample from bit to surface, as required. |
| Drill sample recovery | Method of recording and assessing core andchip sample recoveries and results assessed. | Sample recovery established by dry sample weights undertaken by independent laboratory prior to sample preparation and analysis |
| 77 | Measures taken to maximise sample recoveryand ensure representative nature of the samples. | Some instances of poor recovery near surface. |
| | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gainof fine/coarse material. | Instances of poor recovery are not expected tomaterially impact interpretation of results |
| Logging | Whether core and chip samples have been geologically and geotechnically logged to alevel of detail to support appropriate MineralResource estimation, mining studies and matallurgical studies | Drill cuttings for entire hole logged for lithology by company geologists Logging is qualitative |
| | mining studies and metallurgical studies. Whether logging is qualitative or quantitative innature. Core (or costean, channel, etc.) photography. | Photography of material intersections of claystone taken of relevant chip trays |
| | The total length and percentage of the relevantintersections logged. | |

| Criteria | JORC Code explanation | Commentary |
|---|--|---|
| Sub- sampling techniques and sample preparation | If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotarysplit, etc. and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparationtechnique. Quality control procedures adopted for all sub-sampling stages to maximise representivityof samples. Measures taken to ensure that the sampling isrepresentative of the in-situ material collected,including for instance results for field duplicate/second-half sampling. | Samples, 50% split using a rotary cone splitter, were submitted to ALS Laboratories in Elko for preparation and analysis. |
| Quality of assay data and laboratory tests | Whether sample sizes are appropriate to thegrain size of the material being sampled. The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial ortotal. For geophysical tools, spectrometers, handheldXRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precisionhave been established. | Samples analysed by method ME-MS41 which is an ICP-MS method employing an aqua-regia digest. Aqua-regia is not considered a 'total' digest for many elements however is considered fit for purpose for lithium and has been used extensively by other parties exploring for lithium claystone deposits in the USA. Assay quality was monitored using pulp blanks, as well as certified reference materials (CRMs) at a range of lithium grades. Pulp blank results indicated no material contamination of samples from sample preparation or during the analytical process. CRM results were within 3 standard deviations of certified values. No material systematic bias nor other accuracy related issues were identified. |
| Verification of sampling and assaying | The verification of significant intersections by either independent or alternative company personnel. The use of twinned holes. Documentation of primary data, data entryprocedures, data verification, data storage (physical and electronic) protocols. Discuss any adjustment to assay data. Accuracy and quality of surveys used to locatedrill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. | Sample intervals to be assigned a unique sample identification number prior to sample despatch Lithium-mineralised claystone Certified Reference Materials (standards), pulp blanks and coarse blanks to be inserted into the sample stream at regular intervals to monitor lab accuracy and potential contamination during sample prep and analytical posses Drill collar locations determined using hand- held GPS with location reported in NAD83 UTM Zone 11. Expected hole location accuracy of +/- 10m No downhole surveys conducted on drill holes, with drill rigs lined up by compass and clino at start of hole |

| Criteria | JORC Code explanation | Commentary |
|---|---|--|
| Data spacing and distribution | Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the MineralResource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. | Drill spacing is appropriate for early exploration purposes 5-foot sample interval widely adopted as standard practice in air drilling in the USA. |
| Orientation of data in relation to geological structure | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. | Claystone beds are regionally shallow-dipping at ~20° to the east although locally this may vary across the Project with some evidence of faulting and potential folding |
| Sample security | The measures taken to ensure sample security. | Samples stored at secured yard and shed located in township of Currant until delivered by staff or contractors to the ALS lab at Elko, NV |
| Audits or reviews | The results of any audits or reviews of samplingtechniques and data. | Not applicable |

Section 2 - Reporting of Exploration Results

| | Criteria | JORC Code explanation | Commentary |
|---|--|---|---|
| | Mineral tenement and land tenure status | Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. | Red Mountain Claims held in 100% Astute subsidiary Needles Holdings Inc. Claims located on Federal (BLM) Land Drilling conducted on claims certified by the Bureau of Land Management (BLM) |
| 0 | Exploration done by other parties | Acknowledgment and appraisal of exploration byother parties. | No known previous lithium exploration conducted at Red Mountain Exploration conducted elsewhere in Nevada by other explorers referenced in announcement body text |
| | Geology | Deposit type, geological setting and style of mineralisation. | The principal target deposit style is claystone hosted lithium mineralisation. Claystone hosted lithium deposits are thought to form as a result of the weathering of lithium-bearing volcanic glass within tertiary-aged tuffaceous lacustrine sediments of the mapped Ts3 unit. Lacustrine environments formed as a result of extensional tectonic regime that produced 'basin and range' topography observed across the stateof Nevada. Inputs of lithium from geothermal sources have also been proposed. |
| | Drill hole Information | A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. | Drillhole locations, orientations and drilled depths are tabulated in body report |
| | Data aggregation methods | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shownin detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. | Intersections, where quoted are weighted by length. A 500ppm Li cut-off was used to quote headline intersections, with allowance for 5ft of internal dilution by lower grade material. Low grade mineralisation (300-500ppm Li) is present outside of the quoted intersections Intersections are quoted in both lithium ppm and as wt% Lithium Carbonate Equivalent (LCE). LCE is calculated as LCE = Li (ppm) x 5.323 / 10,000, as per industry conventions. |

Section 2 Reporting of Exploration Results

| Criteria | JORC Code explanation | Commentary |
|---|--|---|
| Relationship between mineralisation | These relationships are particularly important in the reporting of Exploration Results. | Insufficient information available due to early exploration status |
| widths and intercept lengths | If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. | |
| | If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width notknown'). | |
| Diagrams | Appropriate maps and sections (with scales) andtabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. | Included in ASX announcement |
| Balanced reporting | Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. | This release describes all relevant information |
| Other substantive exploration data | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysicalsurvey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | This release describes all relevant information |
| Further work | The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions orlarge-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main | Drill results demonstrate further work at the Red Mountain project is most likely warranted, however this will be subject to receipt of the remaining 4-holes worth of assay results |
| | geological interpretations and future drilling areas, provided this information is not commercially sensitive. | |
