

## DRILLING UNDERWAY AT PRIORITY NORSEMAN TARGETS

### Highlights

- RC drill campaign targeting Platinum Group Elements (PGEs) and nickel/copper is underway at the Norseman Project
- 2,000 metre program with drilling planned for completion within three weeks and first assay results expected in late September/October
- Drill targets are between one and five kilometres to the north of the 17.5Mt Callisto resource<sup>1</sup>
- Drilling is designed to test a combination of geophysical EM targets, geophysical IP targets, and geochemical targets
- Excellent funding with \$13.6 million in cash as at 30<sup>th</sup> June 2024<sup>2</sup>

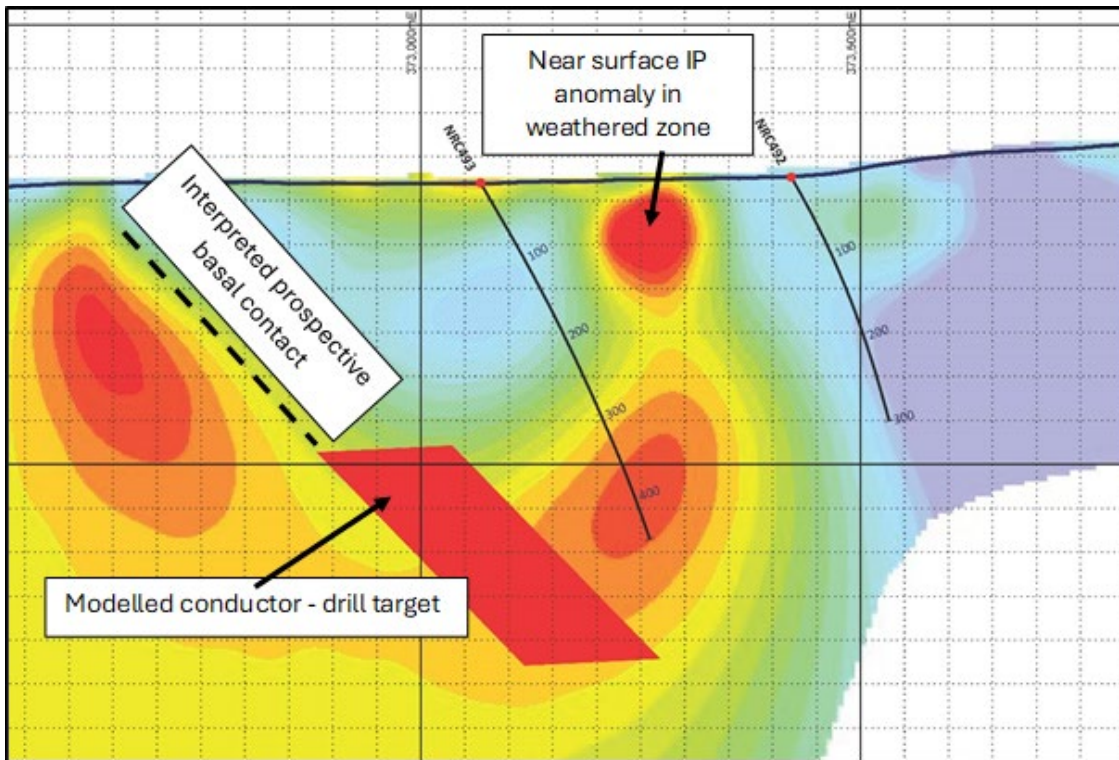

Fig 1: RC drill rig on site at the Norseman Project

<sup>1</sup> See Table 1 and ASX Announcement dated 2 October 2023 for JORC resource details

<sup>2</sup> Quarterly cash flow report dated 16 July 2024

**Figure 2 – Modelled conductive target zone beneath NRC493. IP resistivity background image (red colour in IP image = low resistivity IP anomalies, related to higher conductivity zones)**

Galileo Mining Ltd (ASX: GAL, “Galileo” or the “Company”) is pleased to announce RC drilling north of the Callisto deposit has commenced at the Company’s 100% owned Norseman project in Western Australia.

**Galileo Managing Director Brad Underwood commented;** “RC drilling has commenced at our Norseman Project with a number of high priority targets to be drilled in this work program. Having proven the prospectivity of the area with the discovery of the Callisto deposit, we are now exploring this newly discovered fertile region for further resources. The current program will be drilling a combination of geophysical and geochemical targets between one and five kilometres north of Callisto.

*At the same time, we are continuing our target generation through detailed interpretation of the large-scale IP geophysical data sets we have collected over the entire prospective belt.*

*With \$13.6 million in cash<sup>2</sup> we are fully funded to undertake all planned activities, and we will maintain our focus on exploration through the present market conditions. We believe a new resource discovery will always create value, and that is what we aim for each time we go drilling.”*

Drill targets are based on the results of down hole EM surveying<sup>3</sup>, updated IP survey data<sup>4</sup>, and geochemical/geological targeting<sup>4</sup>. All targets are within the Callisto North prospect between one and five kilometres north of the Callisto deposit.

<sup>3</sup> See ASX announcement dated 22 July 2024

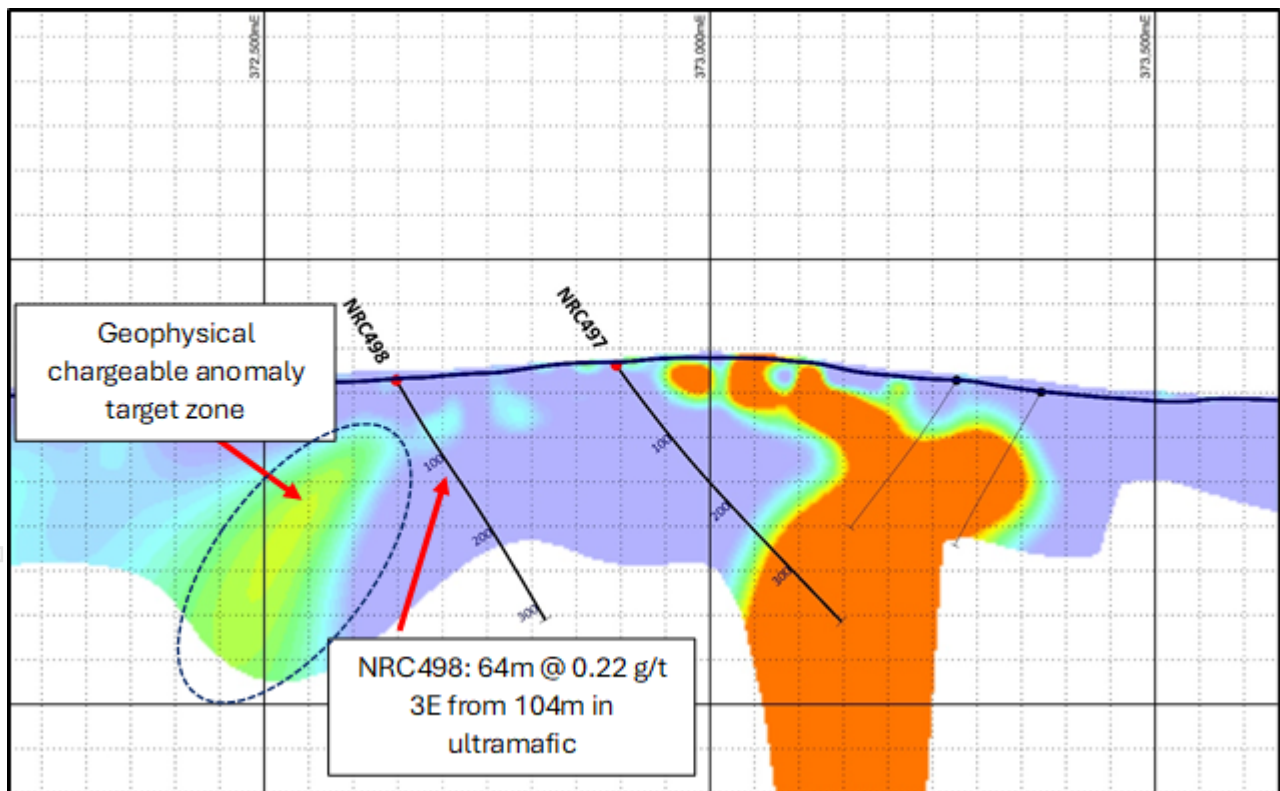

<sup>4</sup> See ASX announcement dated 12 June 2024

Downhole EM surveying was undertaken on drill hole NRC493 (location in Figure 2), which was originally drilled into a high chargeability/low resistivity geophysical anomaly defined by pole-dipole IP surveying. The geology intersected in drill hole NRC493 was unable to explain the geophysical response while intersecting a thick zone of ultramafic rock interpreted to be a unit of the same prospective sill which hosts the Callisto nickel-copper-PGE deposit.

Data from the down hole EM survey showed a highly conductive response which was modelled with a plate size of 202 metres strike length, 432m down dip extent, and a conductance of 16,129S. The model dips to the southeast and passes approximately 100m beneath the drill hole NRC493 (Figure 2).

Another prospective result from the May 2024 round of drilling was received from NRC498, drilled adjacent to a moderately strong geophysical response (see Figure 3). This chargeable response will be the subject of follow up drill testing in the current drill program.

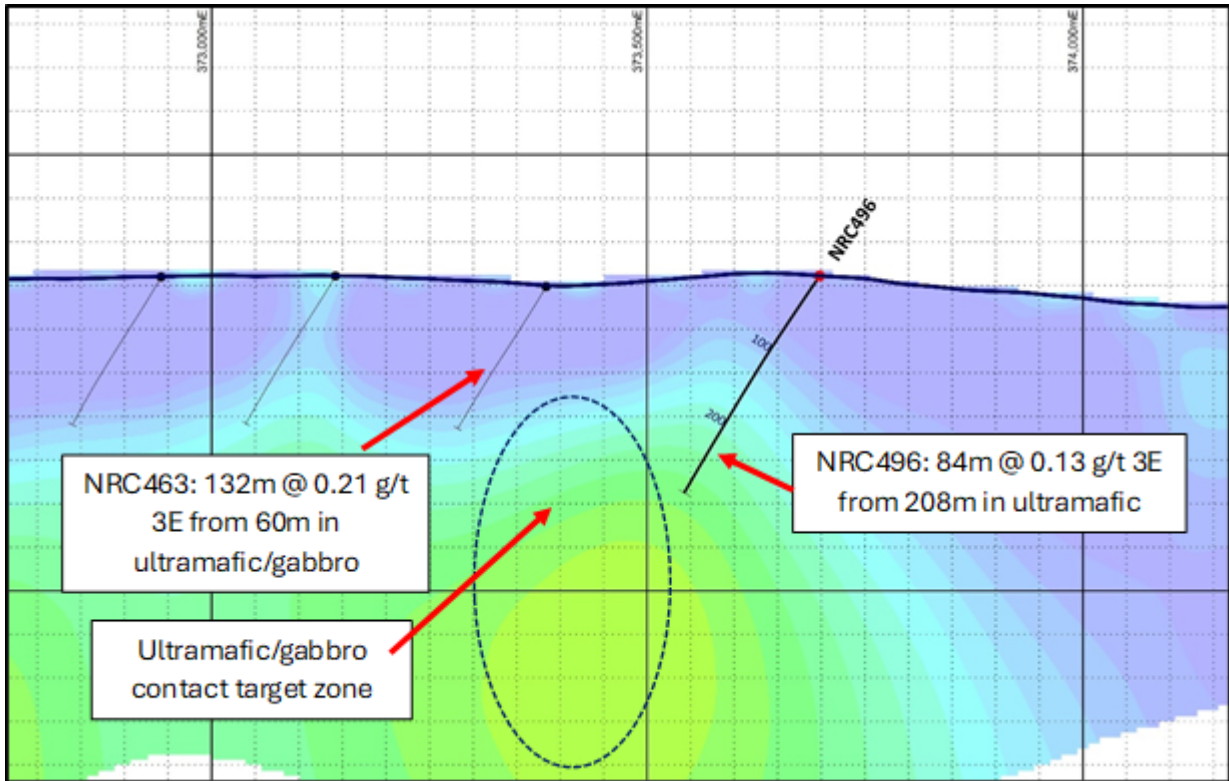

**Figure 3 – Chargeability model of IP survey line 6,449,100N (dipole-dipole data) with anomalous drill results in NRC498 and follow up target zone. NRC497 intersected only minor Pd-Pt in ultramafic rock. A range of chargeable responses will be tested in the current drill program, from very strong to moderate anomalies, to determine whether there is a relationship between Pd-Pt grades and various geophysical parameters (anomaly size/strength/shape/depth below surface etc.)**

Further prospective results were received from NRC496 drilled on section line 6,449,700 (Figure 4). A large zone of anomalous mineralisation has been identified in ultramafic rock which broadly matches the top of a change in chargeable response and a change in geology to the west. This target will be drilled to determine whether the subtle geophysical response and the ultramafic/mafic contact zone are linked to zones of mineralisation.

Regional pole-dipole surveying of the 20km Callisto trend and the 12km Mission Sill trend is now complete with ongoing interpretation to determine which geophysical responses will be selected for drill testing. The exploration strategy is to build on the understanding of the geophysical data gained from recent drilling and to continue working from areas of higher data density (areas with drilling) to those with no drilling.

**Figure 4 –Chargeability model of IP survey line 6,449,700N (pole-dipole data) with anomalous drill results in NRC496, previous drill results from NRC463, and follow up target zone at the contact between ultramafic and gabbroic rocks units.**

**Figure 5 – North Callisto prospect with sulphide target zone and location of recent drilling. TMI magnetic background image. Square black box shows locations of current drill targets.**

## About Galileo Mining:

Galileo Mining Ltd (ASX: GAL) is focussed on the exploration and development of PGE (palladium-platinum), nickel, copper, and cobalt resources in Western Australia. GAL's tenements near Norseman are highly prospective for new discoveries as shown by the Callisto deposit. GAL also has Joint Ventures with the Creasy Group over tenements in the Fraser Range which are prospective for nickel-copper sulphide deposits similar to the operating Nova mine.

### Norseman (100% GAL)

The wholly owned Norseman project contains the Callisto Discovery and adjacent regional prospects Jimberlana and Mission Sill with potential for palladium, platinum, nickel, copper, cobalt, and rhodium mineralisation. Galileo's tenure at Norseman comprises mining, exploration, and prospecting licenses covering a total area of 255 km<sup>2</sup>.

The Callisto deposit was discovered in 2022 and is the first deposit of its type identified in Australia, analogous in mineralisation style to the Platreef deposits found in South Africa. An initial Mineral Resource Estimate was reported in 2023 with 17.5 Mt @ 1.04g/t 4E<sup>2</sup>, 0.20% Ni, 0.16% Cu (2.3g/t PdEq<sup>3</sup> or 0.52% NiEq<sup>4</sup>).

**Table 1 - Callisto Deposit Maiden Mineral Resource Estimate (JORC 2012) (see ASX announcement: 2 October 2023)**

### Metal equivalent price assumptions of Callisto Resource released on 2<sup>nd</sup> October 2023

Based on metallurgical test work completed to date, the Company believes that Callisto's mineralisation is amenable to concentration using a conventional crushing, milling and flotation process and has Reasonable Prospects for Eventual Economic Extraction.

Metallurgical recovery assumptions used for metal equivalent value calculations were: Pd – 82%, Pt – 78%, Au – 79%, Rh – 63%, Ni – 77%, Cu – 94%

Metal price assumptions, based on 12 month calculated averages to 11<sup>th</sup> September 2023, were used for metal equivalent values: Pd – US\$1,600/oz, Pt – US\$975/oz, Au – US\$1,870/oz, Rh – US\$9,420/oz, Ni - US\$23,800/t, Cu – US\$8,420/t

### Fraser Range (67% GAL / 33% Creasy Group JV)

Galileo is actively exploring for magmatic massive sulphide nickel-copper-cobalt deposits across its Fraser Range tenements covering over 600km<sup>2</sup> of highly prospective ground in the Albany-Fraser Orogen. The project is well positioned within the nickel-copper prospective Fraser Range Zone, with the operating Nova-Bollinger mine located between 30km and 90km from Galileo tenure.

<sup>2</sup>4E = Palladium (Pd) + Platinum (Pt) + Gold (Au) + Rhodium (Rh) expressed in g/t

<sup>3</sup> PdEq (Palladium Equivalent) = Pd (g/t) + 0.580 x Pt (g/t) + 1.13 x Au (g/t) + 4.52 x Rh (g/t) + 4.34 x Ni (%) + 1.88 x Cu (%)

<sup>4</sup> NiEq (Nickel equivalent) = Ni % + 0.230 x Pd (g/t) + 0.133 x Pt (g/t) + 0.259 x Au (g/t) + 1.04 x Rh (g/t) + 0.432 x Cu (%)

## Competent Person Statement

The information in this report that relates to Exploration Results is based on, and fairly represents, information and supporting documentation prepared by Mr Brad Underwood, a Member of the Australasian Institute of Mining and Metallurgy, and a full time employee of Galileo Mining Ltd. Mr Underwood has sufficient experience that is relevant to the styles of mineralisation and types of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the “Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves” (JORC Code). Mr Underwood consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

With regard to the Company’s ASX Announcements referenced in the above Announcement, the Company is not aware of any new information or data that materially affects the information included in the Announcements.
