ASX Announcement | 29 October 2024

New Exceptionally High-Grade Gold Intersections from Infill Drilling at Crown Prince

Highlights

- Ora has received assays for a 7,500m, 66-hole infill RC drilling program at Crown Prince. This drilling was undertaken to better define mineralised lodes within the south eastern zone (SEZ) deposit to upgrade resource categories within a future conceptual open pit area.
- This drilling has returned some exceptional grades and intercepts including:
  - **20m at 277g/t Au** from 40m including **4m at 1,368g/t Au** from 52m (OGGRC859)
  - **15m at 14.7g/t Au** from 152m (OGGRC872)
  - **9m at 21.44g/t Au** from 28m including **2m at 77.8g/t Au** from 31m (OGGRC883)
  - **7m at 11.74g/t Au** from 132m (OGGRC874)
  - **11m at 6.72g/t Au** from 4m (OGGRC886)
  - **12m at 6.05g/t Au** from 76m including **4m at 10.2g/t Au** from 80m (OGGRC895)
  - **9m at 6.27g/ t Au** from 66m including **1m at 18.6g/t Au** from 66m (OGGRC888)
  - **7m at 6.87g/ t Au** from 133m (OGGRC864)
- New very high-grade zones have been encountered in the footwall of SEZ lodes which will likely improve grade and tonnage estimates in this area.
- This infill drilling has generally confirmed gold mineralisation modelling and has upgraded the quality in many areas.

Ora Gold Limited **(ASX: OAU**, "**Ora**" or the "**Company**") is pleased to report assay results from infill RC drilling at the Crown Prince Project (M51/886) part of Ora's broader Garden Gully tenure (Figure 1).

Ora is continuing to progress Crown Prince towards development, targeting production commencement mid calendar year 2025. Among the several workstreams underway, including regulatory approvals, the Company has completed infill drilling ahead of releasing an ore reserve.

The program was designed to target zones of mineralisation within a conceptual pit design at Crown Prince that are currently in the inferred category of mineral resource (refer ASX release 20 February 2024). This drilling successfully confirmed mineralised zones and improved gold grades in some key areas.

Other improvements from this infill drilling include delineation of new near surface high grade zones and parallel lodes in new positions in the footwall and hanging wall of the south eastern zone (SEZ) mineralisation.

These zones are within the conceptual open pit for the Crown Prince deposit and are expected to add to the mineral resource and future mining inventory. Importantly, the grades returned in this infill drilling support existing published grades and may provide a foundation for an uplift in the average grade overall for the resource.

Assay results discussed in this announcement are shown in Appendix 1 & Figures 2-5. RC hole details are included in Table 1.

Alex Passmore Ora Gold's CEO commented:

"We are very pleased to report these exceptionally high-grade results returned from recent infill drilling. The infill drilling was carried out successfully and has confirmed or improved the mineralisation model we have for Crown Prince.

Such high-grade headline results demonstrate the high quality nature of the Crown Prince Project and point to its likely strong economics during development and production.

We look forward to providing further information on the updated resource estimate in coming weeks and then to follow up with an ore reserve as work progresses."

Cross Section A-A'

Infill drilling at SEZ has confirmed new FW and HW lodes outside the current mineralisation wireframes, with outstanding high-grade intercepts Including: **20m @ 277.36g/t Au from 40m (incl: 4m @1368.11 g/t Au from 52m) in OGGRC859 and 35m @ 2.96 g/t Au from 173m In OGGRC873.**

Extensions to the current mineralisation model along section A-A have been confirmed by intercepts in OGGRC862, 875 and 872 which include 7m @ 6.87 g/t Au from 133m in OGGRC864 and 15m @ 14.7 g/t Au from 152m (incl: 1m @ 177 Au from 153m).

New high-grade intercepts in OGGRC859, along with previous intercepts in OGGRC477 have highlighted additional mineralised zones close to surface in the footwall, which fall outside existing mineralisation wireframes.

OGGRC873 has strengthened the current interpretation that the high-grade shoots at the southwestern end remain wide and continuous at depth.

The SEZ host geology consists of a series of coarse-grained amphibole dolerites and minor high Mg basalts which grade into an intensely sheared unit proximal to mineralisation. Gold is associated with classic, extensional mesothermal style quartz lodes with characteristic Fe carbonate +/- fuchsite alteration, with high grade zones occurring with sulphide laminations and microstructures that crosscut the early-stage white buck veins.

Recent infill drilling has confirmed that the mineralisation system remains high grade down dip, highlighting potential for future underground mining.

Cross Section B-B'

This infill drilling has helped build upon the current model and better define the deeper extents of mineralisation at SEZ. As is highlighted on cross-section B-B, all the significant intercepts through the eastern end of the SEZ are largely confined within the current mineralisation wireframe.

Significant intercepts along this cross-section include:

- OGGRC879 - 8m @ 3.91g/t Au from surface and 4m @ 1.07g/t Au from 61m
- OGGRC866 – 1m @ 3.3g/t Au from 16m and 17m @ 11.97g/t Au from 19m, including 1m @ 127.15g/t Au from 28m
- OGGRC898 – 13m @ 18.64g/t Au from 42m, including 1m @ 140.5g/t Au from 50m, and 2m @ 12.35g/t Au from 57m.
- OGGRC865 – 14m @ 6.6g/t Au from 62m, including 2m @ 22.93g/t Au from 19m, and 2m @ 1.99g/t Au from 79m.
- OGGRC899 – 3m @ 1.36g/t Au from 72m, 5m @ 31.73g/t Au from 76m, including 2m @ 71.68g/t Au from 76m, and 8m @ 1.33g/t Au from 82m.
- OGGRC870 5m @ 3.33g/t Au from 177m; and 6m @ 1.23g/t Au from 184m
- OGGRC871 4m @ 1.23g/t Au from 207m.

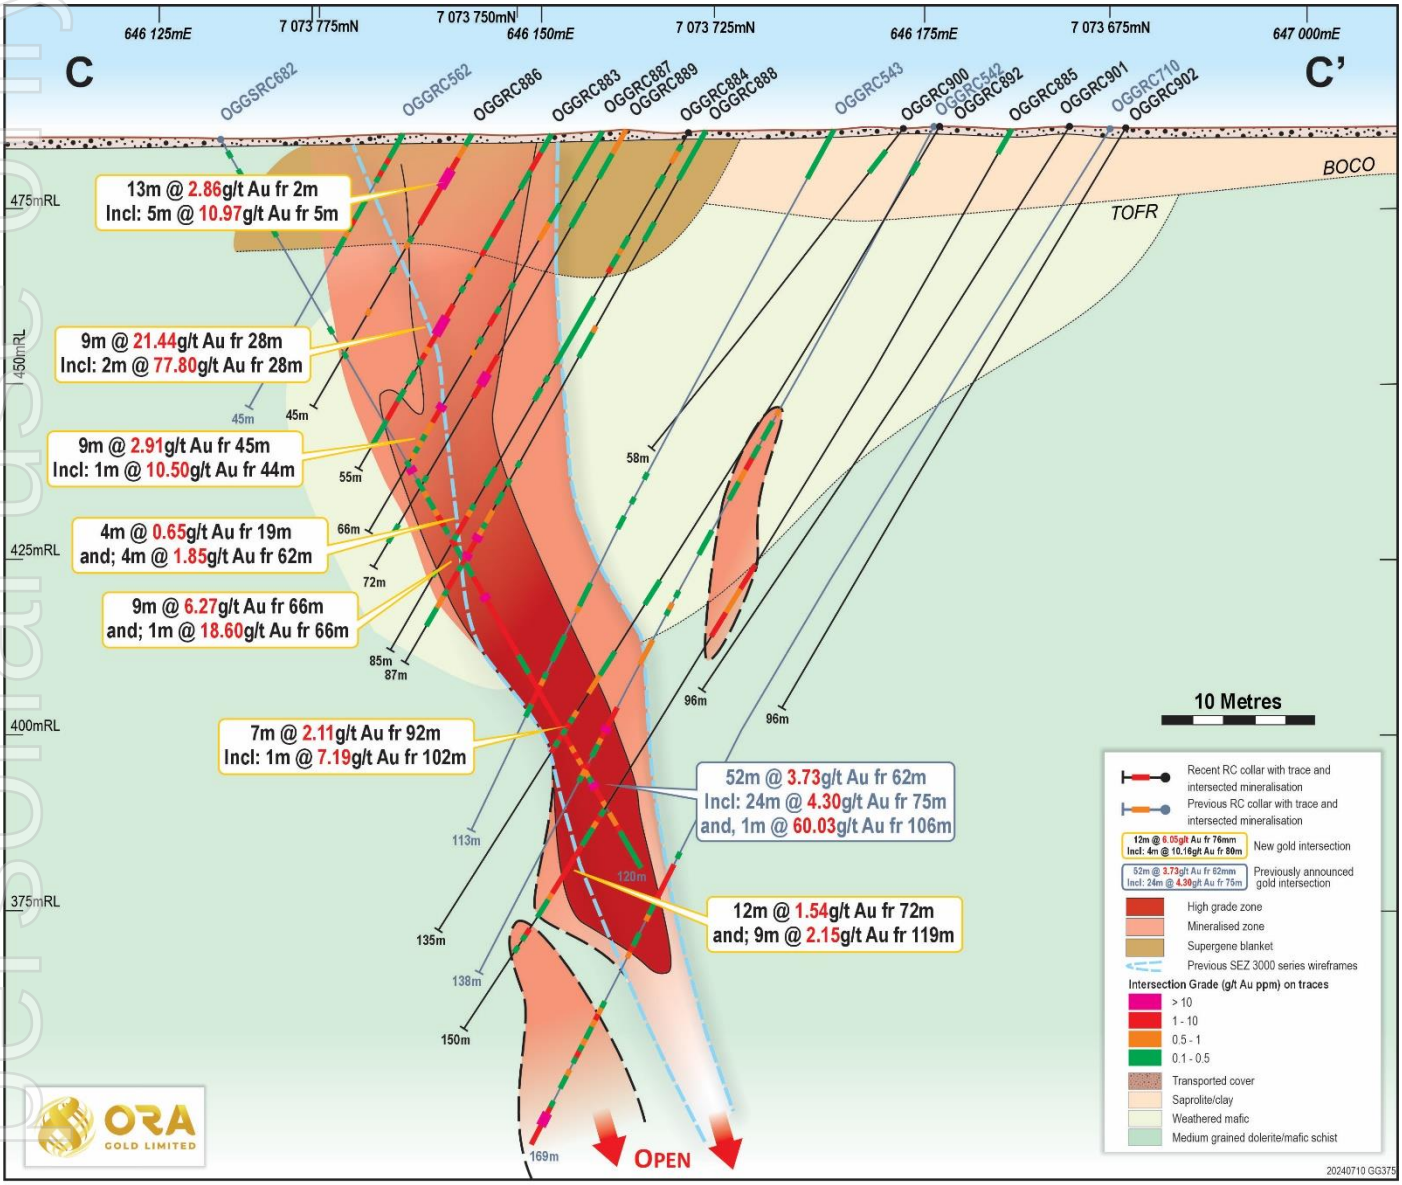

Figure 5. *Cross Section C-C' at the eastern end of SEZ Mineralisation*

Cross-Section C-C'

The latest phase of RC infill drilling has helped to build upon the current SEZ model and has highlighted extensions to mineralised zones outside the current SEZ wireframes.

Significant intercepts along this section include:

- OGGRC886 – 13m @ 2.86g/t Au from 2m, including 5m @ 10.97g/t Au from 5m
- OGGRC883 – 9m @ 20.85g/t Au from 28m, including 5m @ 36.2g/t Au from 28m

ASX Code | **OAU**
ABN | **74 950 465 654**

E | **info@ora.gold**
W | **www.ora.gold**
P | **+61 8 9389 6927**

- OGGRC887 – 9m @ 3g/t Au from 45m, including 1m @ 19.25g/t Au from 45m
- OGGRC884 – 4m @ 0.65g/t Au from 19m and 4m @ 1.85g/t Au from 62m
- OGGRC888 – 16m @ 3.2g/t Au from 62m, including 1m @ 18.62g/t Au from 66m and 1m @ 14.48g/t Au from 69m
- OGGRC892 – 7m @ 2.15g/t Au from 98m, including 1m @ 7.45g/t Au from 102m
- OGGRC885 – 12m @ 1.54g/t Au from 72m and 9m @ 2.15g/t Au from 119m

Intercepts in OGGRC885, both in the HW (12m @ 1.55g/t Au from 72m), and at depth (1m @ 1.22g/t Au from 133m), fall outside the existing mineralisation wireframes and correlate up dip with previous intercepts in OGGRC542 (4m @ 1.7g/t Au from 54m) and OGGRC579 (4m @ 3.5g/t Au from 69m & 12m @ 2.35g/t Au from 77m). The cross-section does not show OGGRC579 which is located 35m off section to the east. This interpreted mineralised lode may be associated with the eastern shear zone that cuts off the eastern extent of SEZ (see drilling overview map). This could imply that there are additional mineralised lodes along the eastern shear zone.

OGGRC883, OGGRC887 and OGGRC888 have also confirmed additional FW extensions mineralisation closer to surface, again falling outside the current SEZ wireframes.

Moving forward, the next phase of drilling in this part of the SEZ will focus on targeting the hanging wall mineralised lodes and follow up on the deeper intercepts identified by OGGRC885 and OGGRC710, exploring the potential for future underground scenarios.

The SEZ mineralisation remains open at depth across all cross-sections.

Next Steps

The drilling outlined in this release brings the drill spacing at the south eastern zone (SEZ) down to around 15m x 15m which is considered sufficient to underpin a predominantly indicated category in new resource estimation runs.

The Company, with its consultants, is working on a resource update to reflect this drilling together with that announced previously. This release is expected in coming weeks and will underpin an ore reserve estimate later in November or early December.

Work on the Crown Prince Project development studies and finalisation of an ore purchase agreement with Westgold Resources Ltd continues. The company looks forward to providing further updates as they are available.

Competent Person Statement

The details contained in this report that pertain to Exploration Results, Mineral Resources or Ore Reserves, are based upon, and fairly represent, information and supporting documentation compiled by Mr Costica Vieru, a Member of the Australian Institute of Geoscientists and a full-time employee of the Company. Mr Vieru has sufficient experience which is relevant to the style(s) of mineralisation and type(s) of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves" (JORC Code). Mr Vieru consents to the inclusion in this report of the matters based upon the information in the form and context in which it appears.

About Ora Gold

Ora Gold Limited (ASX:OAU) is a mineral exploration and development company which holds a substantial package of tenements in the prolific Murchison goldfield near Meekatharra, Western Australia.

The Company is focused on the Garden Gully Gold Project which comprises a 677km^2 tenure package covering the Abbotts Greenstone Belt and other key regional structures. The project has multiple gold prospects along the belt with the most advanced being the Crown Prince Prospect.

Gold mineralisation in the belt is controlled by major north trending structures and contact zones between felsic and mafic metamorphosed rocks.

Crown Prince Prospect is located within a granted mining lease and is advancing towards development.

Appendix 2: JORC Table 1 Checklist of Assessment and Reporting Criteria

Section 1. Sampling Techniques and Data
(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code Explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down-hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representativity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3 kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	• 1m split samples and 4m composite samples were collected from RC drilling. 1m samples were collected from areas of interest such as quartz veins, strong alteration and mineralization based on geologist's logs and arsenic contents from hand-held XRF analyser. 4m composites samples were collected with spear. 4m composite samples were collected from outside of areas of interest such as barren host rock. • 5-6% QAQC samples comprising certified reference materials (CRM), blanks and field duplicate samples were inserted within the RC samples before dispatching to laboratory. • The presence or absence of mineralisation is initially determined visually by the site geologist, based on experience and expertise in evaluating the styles of mineralisation being sought. • The Vanta XRF Analyser is calibrated before each session and is serviced according to the manufacturer's (Olympus) recommended schedule.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• Drilling technique was a Reverse Circulation (RC) with a hammer diameter of 5.5" (130mm) using a truck mounted 660 Schramm drill rig with a 1350cfm/500psi onboard Sullair compressor.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• The volume of material collected from each metre interval of drilling completed is monitored visually by the site geologist and field assistants. • Samples are split on the RC rig cone splitter. • There is no evidence of either a recovery/grade relationship or of sample bias.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• RC chips are logged visually by qualified geologists for the entire length of each drill hole. Lithology, and where possible structures, textures, colours, alteration types and minerals estimates are recorded. • Representative chips are retained in chip trays for each meter interval drilled. • Chips collected in chip trays were photographed and chip photos were used to validate assay results and lithology logging.

Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representativity of samples.* • *Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• 1m RC samples collected are from cone splitter of RC drill rig. 4m composite samples were collected by spearing a cube into 1m split samples. • The samples were sent to Intertek labs in Perth for Au analysis by FA50 (Fire Assay on 50g charge). Sample preparation techniques are well-established standard industry best practice techniques. Drill chips are dried and crushed and pulverised (whole sample) to 95% of the sample passing -75µm grind size. • Field QC procedures include using certified reference materials as assay standards every 20m. One duplicate sample is submitted for every 50 samples and a blank for every 50 samples, approximately. • Lab samples are approximately 2-3kg in weight collected from rig splitter. Rejects from the splitter are stored in green bags on site until rehabbed. • Sample size follows industry standard best practice and is considered appropriate for these style(s) of mineralisation.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.* • *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	• The assay techniques used for these assays are international standard and can be considered total. Samples were dried, crushed and pulverised to 95% passing -75µm using 50g Fire Assay and analysed by Inductively Coupled Plasma Optical (Atomic) Emission Spectrometry. • The handheld XRF equipment used is an Olympus Vanta XRF Analyser owned by Ora Gold Ltd. Ora follows the manufacturer's recommended calibration protocols and usage practices but does not consider XRF readings sufficiently robust for public reporting. Ora Gold Ltd uses the handheld XRF data as an indicator to support the selection of intervals for submission to laboratories for formal assay. • The laboratory that carried out the assays is an AQIS registered site and is ISO certified. It conducts its own internal QA/QC processes in addition to the QA/QC implemented by Ora Gold Ltd, as its sample submission procedures. Evaluation of the relevant data indicates satisfactory performance of the field sampling protocols in place and of the assay laboratory. The laboratory uses check samples and assay standards to complement the duplicate sampling procedures practiced by Ora Gold Ltd.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	• All significant intersections are calculated and verified on screen and are reviewed prior to reporting. • Data is collected and recorded in the field onto field laptops as electronic files that are then copied to head office. • No adjustment to assay data has been needed.

P | **+61 8 9389 6927**

Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	• Drill hole locations have been established using a differential GPS with an accuracy of ±0.3m. • Grid system used for surveying collar locations is GDA2020 / MGA Zone 50. • Downhole survey shots were taken at every 5m using a Gyro survey tool which is referenced to True North
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	• Drill hole collars were located and oriented to deliver maximum relevant geological information to allow the geological model being tested to be assessed effectively. • The infill drilling described in this release brings the drill spacing to the SEZ mineralisation down to a spacing of approximately 15m x 15m which is considered to give a strong control on mineralisation and grade. • 1m sampling was taken across mineralised zones and across hanging wall and foot wall contacts. • 4m composite sampling was applied outside of interpreted mineralised envelopes. In places these composites have returned high grades. All anomalous sample intervals are reported in Appendix 1. • Zones where geological logging and/or XRF analyses indicated the presence of mineralised intervals were sampled on one meter intervals.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• This programme continues from drilling programs undertaken at Crown Prince since 2022 to delineate and better define the mineral resource. • The majority of drill holes within this area have been drilled 320 to 360 degrees north-westerly at -60 degrees dip. • Data collected so far presents no suggestion that any sampling bias has been introduced.
Sample security	• *The measures taken to ensure sample security.*	• When all relevant intervals have been sampled, the samples are collected and transported by company personnel to secure locked storage in Perth before delivery by company personnel to the laboratory for assay.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Internal reviews are carried out regularly as a matter of policy. All assay results are considered representative as both the duplicates, standards and blanks from this programme have returned satisfactory replicated results.

Section 2. Reporting of Exploration Results
(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• The Garden Gully project comprises of one prospecting license, P51/3009, twenty-one granted exploration licenses E51/1737, E51/1661, E51/1708, E51/1609, E51/1790, E51/1791, E51/2150, E51/1709, E51/1888, E51/1924, E51/1936, E51/1963, E51/1989, E51/2002, E51/2012, E51/2013, E51/2014, E51/2015, E51/1932, E51/1972, E51/1973 and four mining leases M51/390, M51/567, M51/886 and M51/889, totaling approximately 677km2. Ora Gold Limited holds a 100% interest in each lease. The project is partially located in the Yoothapina pastoral lease, 15km north of Meekatharra, in the Murchison of WA. • The licences are in good standing and there are no known impediments to obtaining a licence to operate.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• First workings in the Garden Gully area: 1895 - 1901 with the Crown Gold Mine. 264 tonnes gold at 1.99 oz/t average (~ 56 g/t Au). Maximum depth~24m. Kyarra Gold Mine (1909 – 1917): 18,790 oz gold from quartz veins in “strongly sheared, decomposed, sericite rich country rock”. • Seltrust explored for copper and zinc from 1977, reporting stratigraphically controlled “gossanous” rock from chip sampling and drilling. • In 1988, Dominion Gold’s exploration at Crown defined a >100ppb gold soil anomaly. RAB to 32m: “no significant mineralisation”: drilling was “sub-parallel to the dip of mineralisation”; best intersection: 15m at 2.38g/t from 5m. • 1989 at Lydia: Julia Mines RAB drill holes 30 m intervals 100m apart across the shear zone targeting the arsenic anomaly. 12m at 5.16 g/t Au from 18m; 6m at 3.04 g/t Au from 18m. No samples deeper than 24m due to poor recovery, so open at depth in the prospective shear zone. Julia also drilled shallow air core at Crown mine, returned best intersection of 2m at 0.4g/t Au from 34m in quartz veins in felsic volcanics. • In 1989, Matlock Mining explored North Granite Well and Nineteenth Hole; best result 8m at 2.1 g/t Au. Supergene zone: grades to 3.17 g/t Au and still open. • 1993 – 2003: St Barbara Mines: RAB, RC on E51/1661. Gold associated with black shale (best: 1m at 0.64 g/t). • In 1996, Australian Gold Resources RAB and RC drilling found Cu, Zn and Ag anomalies (up to 1800ppm Cu, 1650ppm Zn and 3.8 g/t Ag) associated with saprolitic clay and black shales at 60-80m deep on current E51/1661.

		• 2001-2002, Gamen (Bellissimo & Red Bluff Noms) trenched, sampled, mapped and RC drilled at Crown. Results (up to 0.19 g/t Au) suggest the presence of gold mineralisation further to the east of Crown Gold Mine. • 2008 – 2009: Accent defined targets N and S of Nineteenth Hole from satellite imagery and airborne magnetics.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Garden Gully project covers most of the Abbotts Greenstone Belt; comprised of Archaean rocks of the Greensleeves Formation (Formerly Gabanintha); a bimodal succession of komatiitic volcanic mafics and ultramafics overlain by felsic volcanics and volcaniclastic sediments, black shales and siltstones and interlayered with mafic to ultramafic sills. Regional synclinal succession trending N-NE with a northern fold closure postdating E-W synform, further transected by NE trending shear zones, linearity with the NE trend of the Abernathy Shear, which is a proven regional influence on structurally controlled gold emplacement in Abbotts and Meekatharra Greenstone Belts and in the Meekatharra Granite and associated dykes. CROWN PRINCE • Crown Prince is a deformed orogenic style vein gold deposit with quartz- Fe carbonate-pyrite-pyrrhotite-arsenopyrite ±scheelite ±sphalerite ±gold mineralogy. Late-stage veins contain quartz-feldspar-Fe carbonate-rutile. • Ore veins are typical laminated and extensional mesothermal style veins with significant post emplacement deformation including shearing, folding and boudinage, and are offset across late N-S striking faults. Ductile deformation that affects the veins may be entirely post mineral or related to progressive deformation that outlasted the vein emplacement event. • High-grade gold is associated with minor structures, sulphidic laminations and fractures that overprint early-stage thick white buck quartz veins. • Crown Prince and other deposits and occurrences on the major dextral Abernethy Shear Zone and its splay shears share common SW pitching mineral elongation lineation and ore shoot plunge. The SE Zone, Main and North Zones are all open down plunge and should be drill tested for extensions. A hole has been planned to test the SE Zone plunge with a ~30m step out. • Crown Prince SE Zone strikes 060 with 75 SE dip, Main Zone strikes 095 with 75 south dip, and North Zone strikes 140 with 80 SW dip - all of which are at variance to the common NNE-striking regional trend of structure and

		mineralised zones in the Abbotts Greenstone Belt. Another similar occurrence is the Battery Prospect which is a NW-striking laminated vein. At Crown Prince lode orientations are possibly related to rotations about a major N-S striking ultramafic shear zone that dissects the North and Main zones from the SE zone. • Crown Prince geology includes sequences of coarse-grained amphibole dolerite, leucoxene dolerite, high magnesium basalt, variolitic pillow basalt, interflow black shale, basalt hyaloclastite and talc-chlorite ultramafic rock. High intensity shearing and schist development appear confined to the most altered rocks in the vicinity of mineralised zones and as such may represent alteration weakened zones that are preferentially deformed. REGIONAL • Gold mineralisation in the Southernmost tenements (E51/1989, E51/2002 E51/1936) has a similar orogenic depositional style to the rest of the Garden Gully Prospects but is hosted within the Meekatharra-Wydgee greenstone belt. The area is characterized by the Norrie group and the Meekatharra Formation (part of the Poelle Group). The Noorie Group comprises of thick successions of pillowed and massive tholeiitic basalts and conformably overlying felsic volcanics with interbedded Banded Iron Formations and felsic rocks of the Yaloginda Formation. The Meekatharra formation is composed of weakly metamorphosed basalt, komatiic basalt and other ultramafic rocks. The Au is associated with the Burnakura Shear Zone which is again typical of a brittle to semi-ductile shear zone which would form semi-continuous dilatational veins. The local Burnakura Mine (under care and maintenance by Monument) is located approximately 3km away from Ora's tenements and features mineralization dominated by steeply dipping quartz (±minor sulphides) veins orientated parallel to the foliation of the fault zone. • Mineralisation in the West Caledonian tenements (E51/1709 and E51/2013) can be shown in the Kohinoor open pit mine. This is an isolated gold mine and features Au mineralisation located on the contact between banded iron formations and meta basalts and associated with steep SW plunging ore shoots which are structurally controlled by shear zone orientated NW-SE. within this mine there is a high association with sulphides (pyrite and pyrrhotite) and quartz veining which runs parallel to the shear zones. Much of the tenement is largely untested greenstone belt. • The project is blanketed by broad alluvial flats, occasional lateritic duricrust and drainage

		channels braiding into the Garden Gully drainage system. Bedrock exposures are limited to areas of dolerite, typically massive and unaltered. Small basalt and metasediment outcrops exist, with some exposures of gossanous outcrops and quartz vein scree. Gold bearing quartz reefs, veins and lodes occur almost exclusively as siliceous impregnations into zones within the Kyarra Schist Series, schistose derivatives of dolerites, gabbros and tuffs, typically occurring close to axial planes of folds and within anastomosing ductile shear zones.

Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all material drill holes:*
	  ○ *easting and northing of the drill hole collar*
	  ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar*
	  ○ *dip and azimuth of the hole*
	  ○ *down hole length and interception depth*
	  ○ *hole length.*
	• *If the exclusion of this information is justified on the basis that the information is not material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*
		• All relevant drill hole details are presented in Table 1.

Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• All significant drill intercepts are displayed in Figures 2-5. Full assay data over 0.1g/t Au are included in Appendix 1. No assay grades have been cut. • Arithmetic weighted averages are used. For example, 73m to 76m in OGGRC897 is reported as 3m at 2.50g/t Au. This comprised 3 samples, each of 1m, calculated as follows: [(1*1.457) +(1*1.963) +(1*4.081)] = [7.501/3] = 2.50g/t Au. • No metal equivalent values are used.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results. If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg. 'down hole length, true width not known').*	• SEZ mineralisation is interpreted to have a flexure in the southwestern end. The northeastern 2/3 of the ore body is interpreted to strike to NE060° whereas the southwestern 1/3 of it to strike to ENE080°. The orebody dips to southeast at between 75° and 80°. The orebody is around 20m wide at or near surface. The width of the orebody is widest towards the southwestern end whereas it is narrower towards the northeastern end. • Holes are drilled at a dip of -60° reasonably perpendicular to the strike of the orebody (NW330°). True width of the intersections are around 70% of downhole width.

Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to, a plan view of drill hole collar locations and appropriate sectional views.*	• Relevant location maps and figures are included in the body of this announcement (Figures 2-5). Sufficient data have been collected to allow a meaningful cross-section to be drawn with confidence (Figures 2-5).
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• This announcement includes the results of 66 RC drill holes. The reporting is comprehensive and thus by definition balanced.
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including, but not limited to: geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density; groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• NA
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Mineral Resource estimate update is close to being finalised. • Ore Reserves studies are well advanced • Ore body is open at depth and future drilling will target increasing the scale of the ore body at depth. • Near-mine or semi-regional exploration is focused on identifying repeats of Crown Prince within the same lithological corridor.
