ASX Limited - Company Announcements Platform

COMMENCEMENT OF DIAMOND DRILLING BASED ON PIONEERING SEISMIC SURVEY RESULTS

KITLANYA WEST COPPER PROJECT, BOTSWANA

Cobre Limited (ASX: **CBE**, **Cobre** or **Company**) is pleased to announce the commencement of Diamond Drilling (**DD**) designed to test and verify targets identified from active seismic surveys completed in 2024 (see ASX announcement 22 September 2024 and 19 June 2024) on the Kitlanya West Project (**KITW**), Botswana. The drill programme forms part of the recently announced BHP earn-in to joint venture agreement (see ASX announcement 10 March 2025) and includes 3 deep (>1km) mineral systems holes which will target large anticlinal trap-sites identified in seismic sections and provide insights to the deeper basin architecture. Each drill hole has been designed to:

- Provide stratigraphic and geological control for seismic interpretation, particularly:
 - locating the primary redox contact associated with copper-silver mineralisation;
 - understanding the source of reflective packages identified in seismic sections;
 - establishing the reflective characteristics of basement, footwall and hangingwall stratigraphy;
 - establish the composition of the local stratigraphy.;
- Provide velocity logs for seismic processing;
- Test structures and anticlinal fold hinge zones as potential trap-sites for copper-silver mineralisation identified in shallow Reverse Circulation (**RC**) drilling and soil sampling programmes (see ASX announcement 29 November 2023);
- Provide key information on the underlying oxidised source rock, fluid pathways and structural trap-sites to assess the potential for Tier 1 copper deposit/s formation;
- Test the source of dense anomalies identified in Airborne Gravity Gradient (**AGG**) surveys (see ASX announcement 29 January 2024) and the relationship with alteration and copper-silver mineralisation; and
- Provide important information on the Kalahari Copper Belt (**KCB**) basin architecture which will be used to understand the primary controls for copper-silver mineralisation.

Site clearing and preparation for drill rig mobilisation will commence shortly with drilling planned to commence in April 2025.

Commenting on the seismic results and follow-up drill programme, Adam Wooldridge, Cobre's Chief Executive Officer, said:

"We're pleased to get this exciting programme underway so quickly. In addition to testing for copper-silver mineralisation in compelling trap-sites, drill results will answer a variety of key questions assessing the potential for the northern KCB margin to host large Tier 1 deposits. Results from this important phase of work will be used to further refine our seismic driven targeting strategy."

A total of 61.5 km of 2D reflection seismic survey was collected by HiSeis Pty Ltd on the **KITW** project in Q3 2024. The seismic lines focussed on the northern portion of the project area and were designed to image sub-basin architecture, the basin margin contacts, controlling structures and fold geometry associated with the Tlou target which forms part of a set of compelling fold trap-sites which may host copper-silver deposits. Seismic data collection was undertaken using an 11KJ weight drop source with Stryde 10Hz geophone nodes at 10m spacing providing clear reflective imaging to approximately 7km depth. Results clearly delineate aspects of the basin architecture while highlighting several key features which promote the projects' potential to host large copper-silver deposits within the KCB basin (see **Figures 1 and 2**):

- Deep, fault bounded constrained sub-basins provide ideal setting for copper-rich brine concentration;
- Large-scale basin bounding structures provide well developed plumbing systems for copper-rich fluid migration;
- Several well-developed thrust-breach anticlinal fold structures provide ideal trap-sites for potential copper-silver deposits; and
- Excellent correlation of gravity and seismic data over the Tlou Target which appears to represent a prominent structurally bounded anticline with clear copper association from shallow RC and soil geochemistry results.

In order to evaluate the seismic results, three deep DD holes are planned to intersect interpreted anticlinal trap-site structures identified on seismic lines 1 and 3 (see **Figures 3 and 4**). The drill holes are designed to pass through the reduced marine sedimentary rocks of the D'Kar Formation, assessing any copper-silver mineralisation on the contact with the underlying oxidised Ngwako Pan Formation, investigate the source potential of the Ngwako Pan Formation red beds, basal Kgwebe Formation volcanoclastic sequence and underlying basement rocks. The first two drill holes, with estimated depths of 1,300m and 1,100m respectively, will test the Tlou target and a similar target setting some 16km along strike. A third hole is planned based on results from the first two test holes.

This phase of work forms the first part of a larger ~A\$11m exploration budget for the 2025/26 period undertaken in partnership with BHP (see *ASX announcement 10 March 2025*). The 2025/26 programme includes further seismic survey along with a number of deep test holes designed to assess the potential of both of Cobre's Kitlanya projects to host Tier 1 copper-silver deposits.

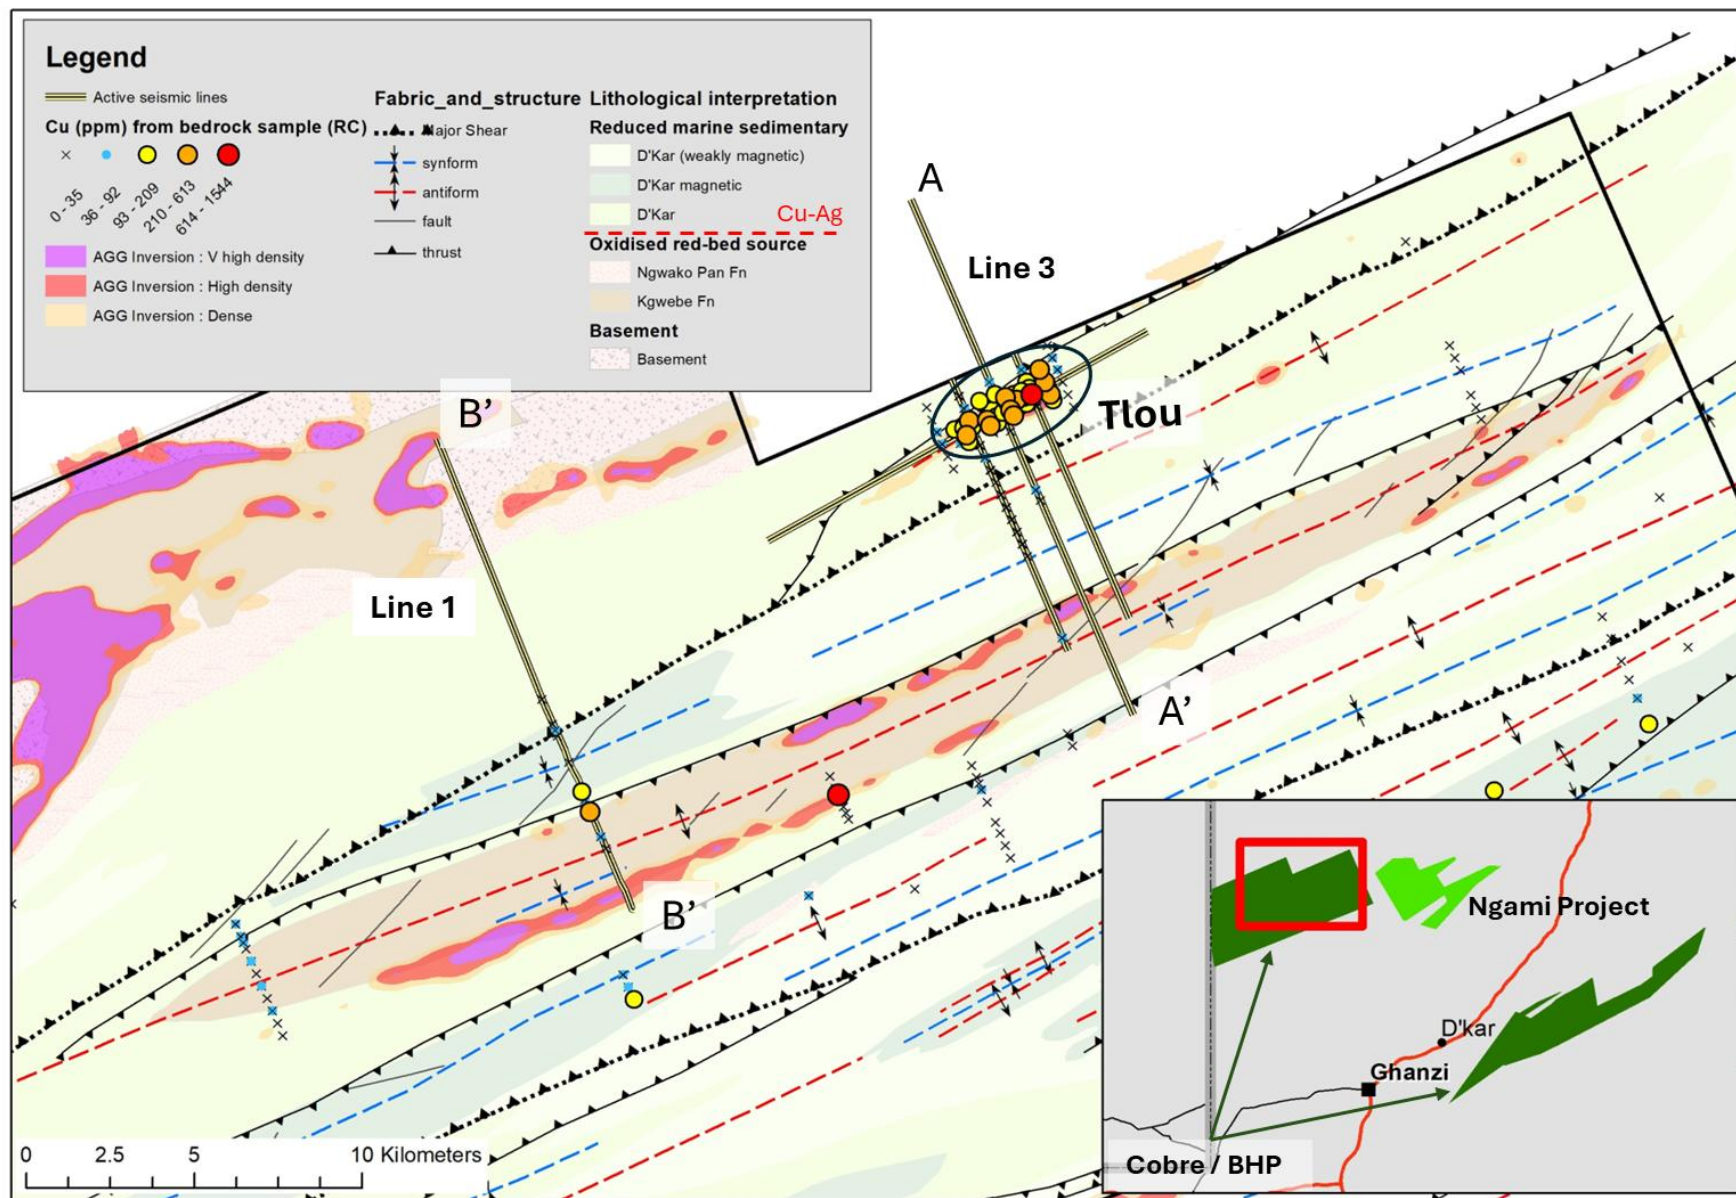

Figure 1. Location of completed seismic lines on lithostructural interpretation. Anomalous bedrock copper samples and dense sources from the AGG survey are highlighted.

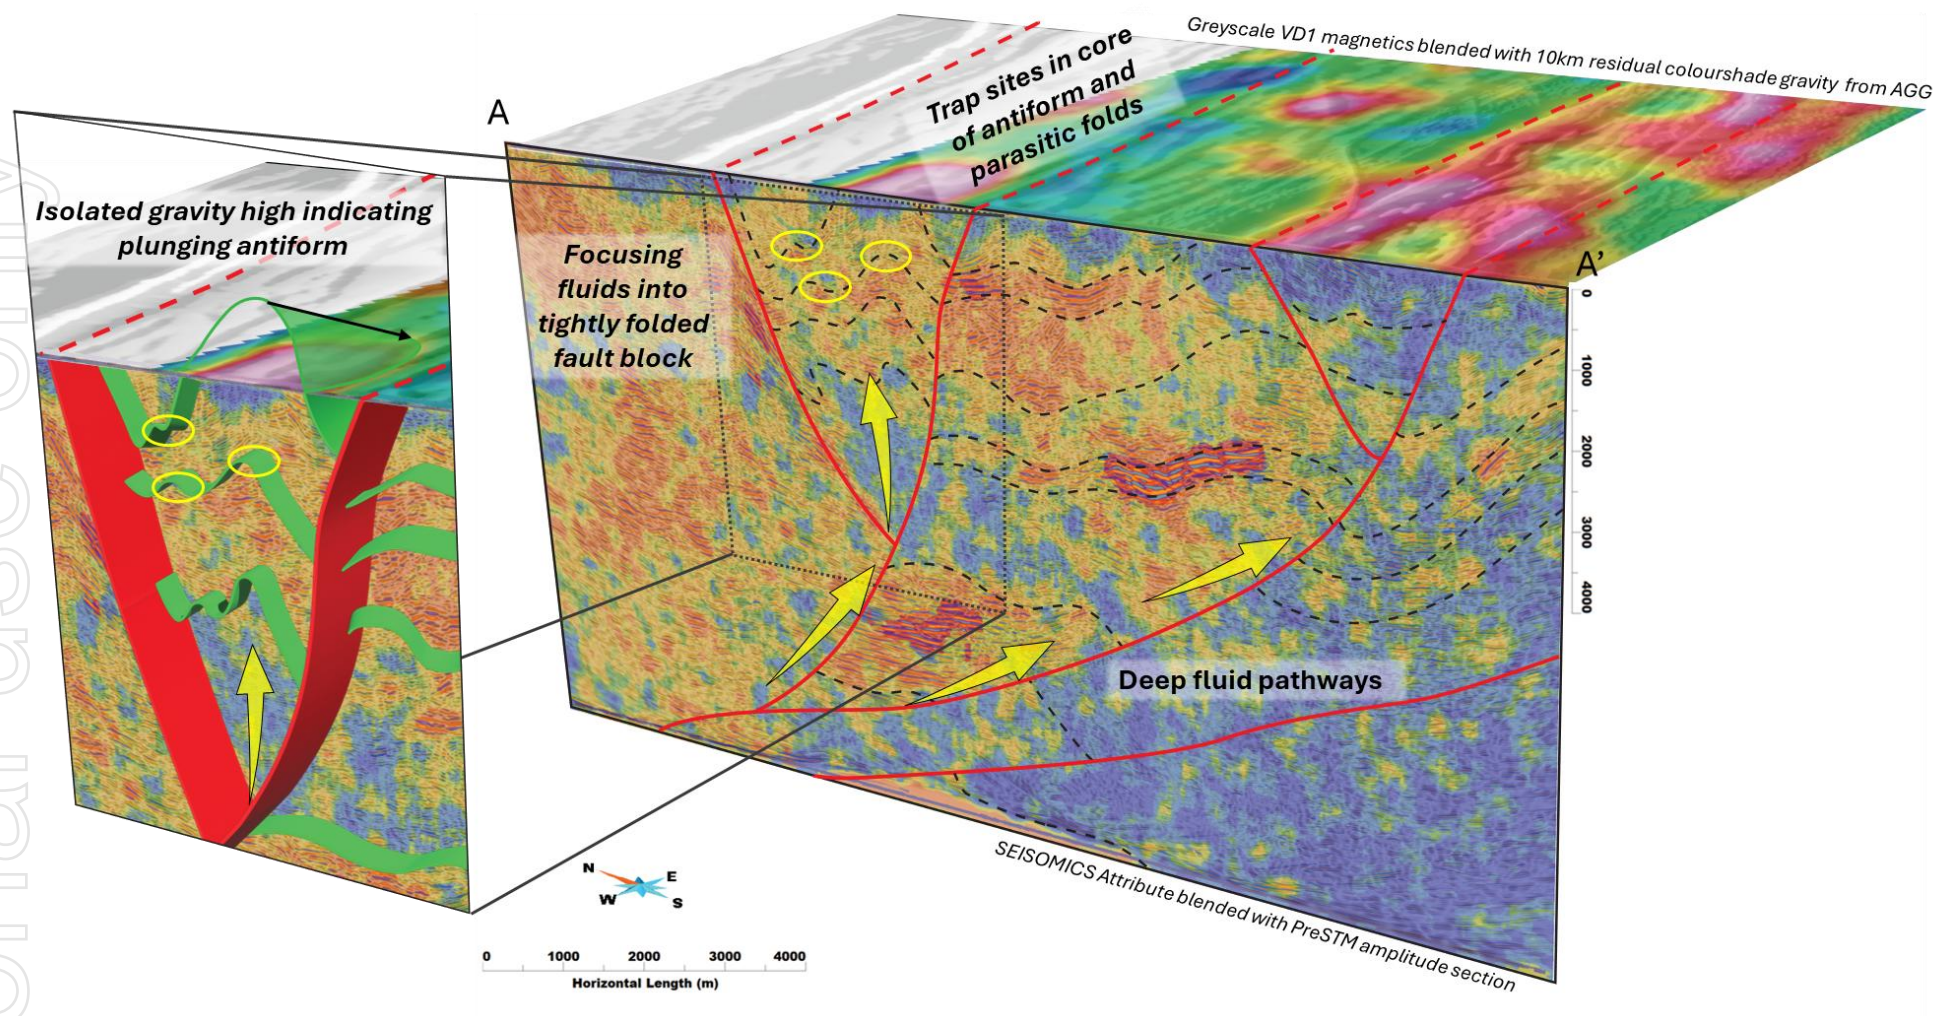

Figure 2. Schematic seismic interpretation highlighting the trap-site potential in Tlou target which is clearly apparent as a tightly folded, fault-bounded, plunging antiform.

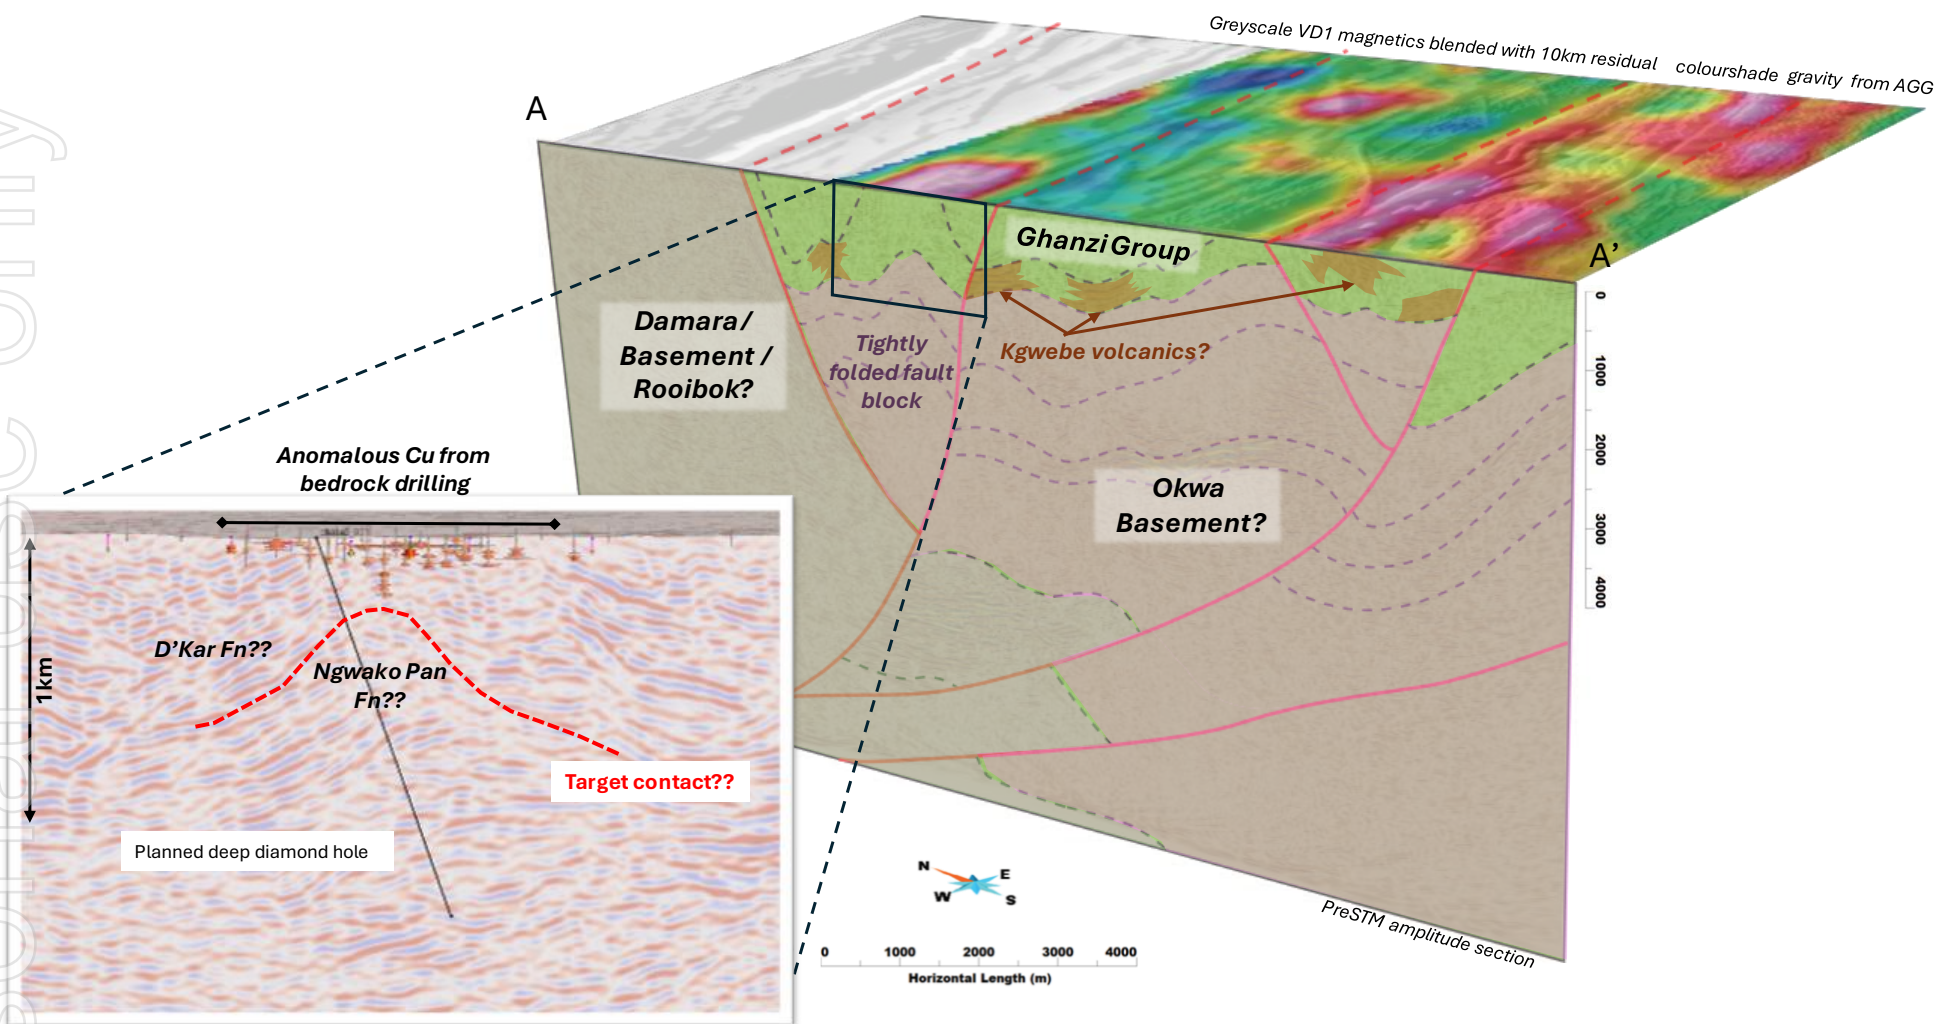

Figure 3. Schematic seismic interpretation highlighting the proposed test drill hole into the Tlou Target. The hole will test for the source of the copper mineralisation identified in bedrock sampling, nature of the dense source identified in AGG survey, the position of the D'Kar Formation / Ngwako Pan Formation redox contact as well as potential trap-sites for copper-silver mineralisation.

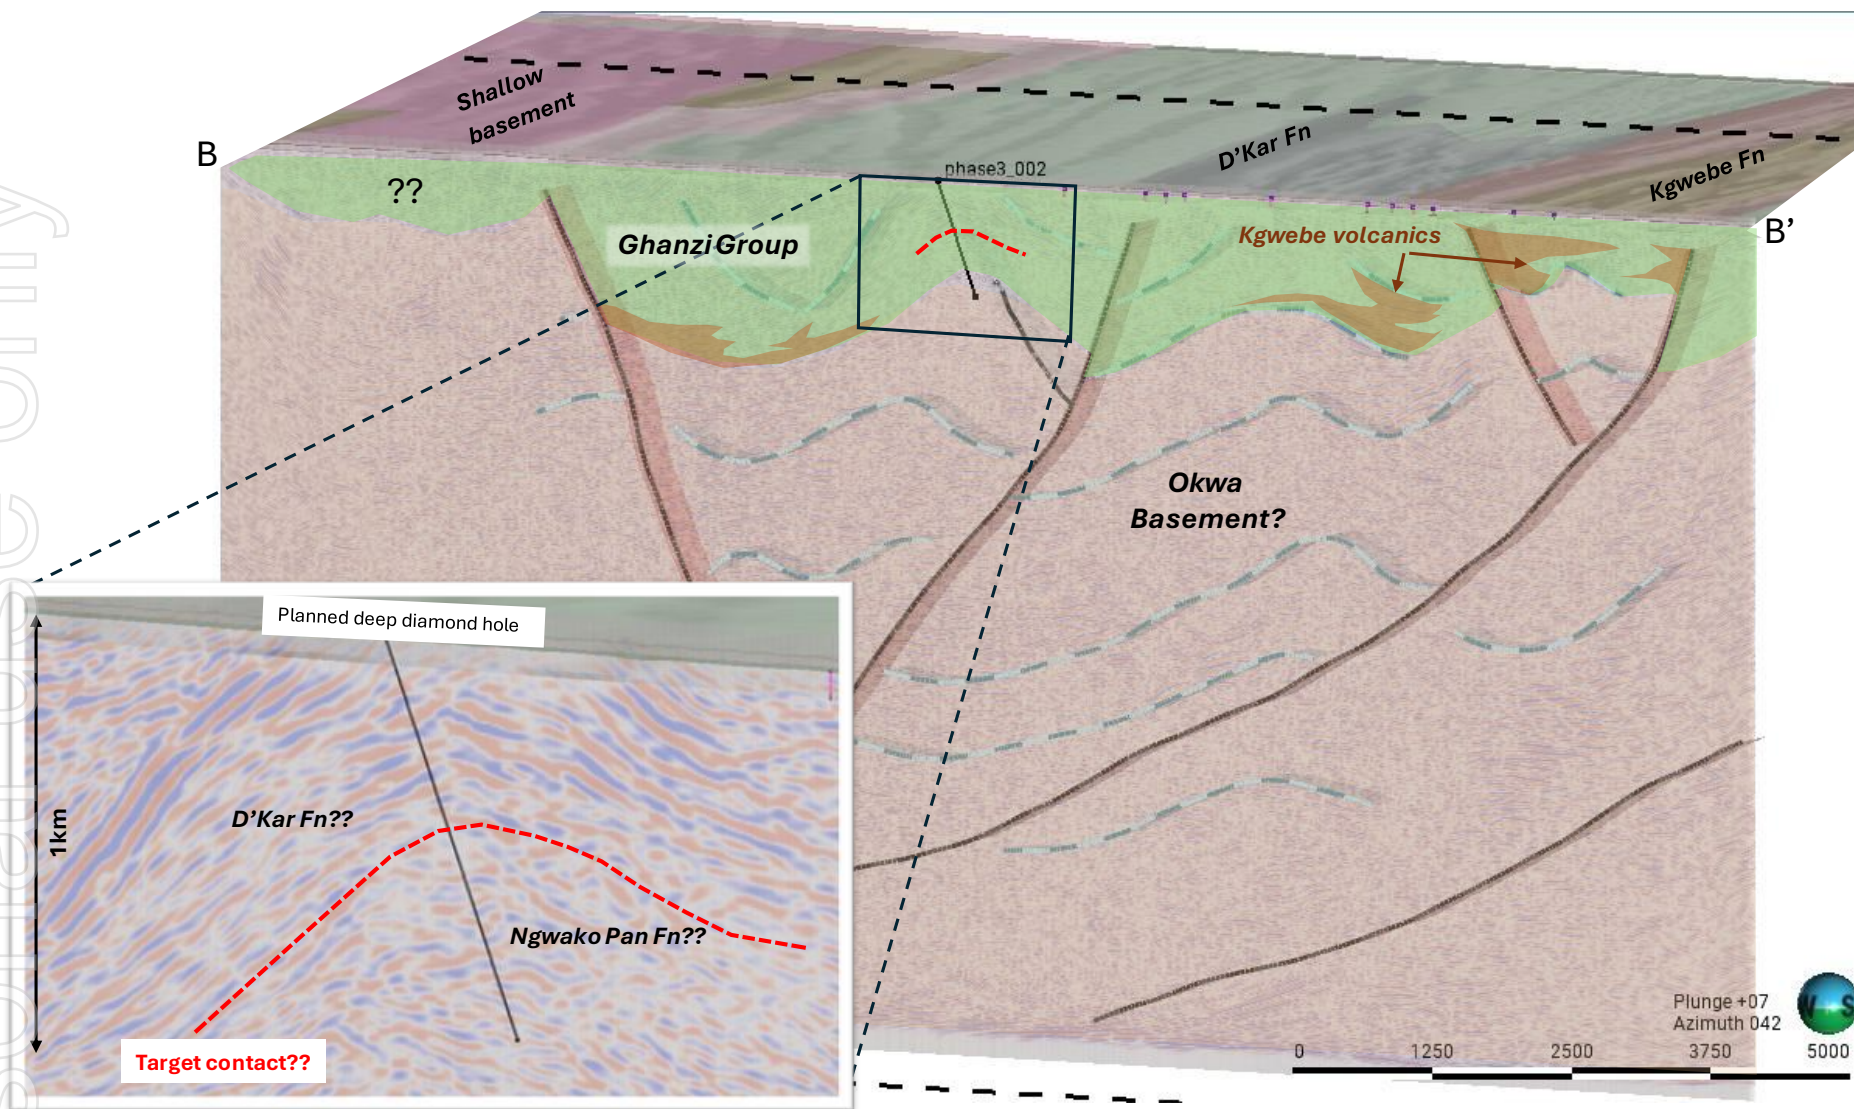

Figure 3. Schematic seismic interpretation highlighting the proposed test drill hole on seismic line 1 along strike from Tlou. The hole will test for the position of the D'Kar Formation / Ngwako Pan Formation redox contact as well as potential trap-sites for copper-silver mineralisation.

Geology, Mineralisation and Exploration Target

Mineralisation in the KCB is sediment-hosted and structurally controlled, with copper-silver mineralisation most frequently hosted along the redox contact between the basal units of the reduced marine sedimentary rocks of the D'Kar Formation and oxidised clastic sedimentary red bed units of the Kuke and Ngwako Pan Formations and the underlying volcanosedimentary Kgwebe Formation. Of particular interest are the tight, upright folds which offer ideal trap-sites for upgrading of copper-silver mineralisation and formation of large deposits. These folds are typically bounded by district-scale shears (often with evidence of copper anomalism) which would provide the necessary plumbing architecture for movement of copper-rich fluids during basin formation and subsequent closure and deformation. A schematic illustration of the preserved fold hinge model is illustrated in Figure 5. Exploration is currently focussed on advancing and testing these buried anticline hinge zones which provide the best location for the formation of Tier 1 deposits.

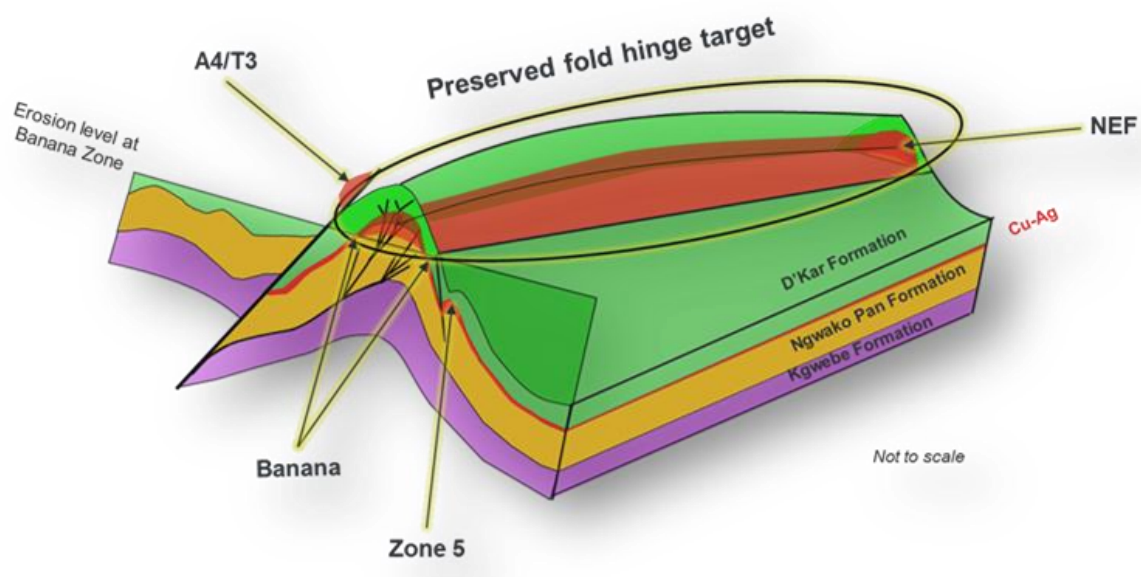

Figure 5: Schematic illustrating of the target model compared with typical settings for known KCB deposits.

This ASX release was authorised on behalf of the Cobre Board by: Adam Wooldridge, Chief Executive Officer.

| <i>Data aggregation methods</i> | <ul style="list-style-type: none"> <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> | <ul style="list-style-type: none"> <i>Not applicable to this announcement</i> |
| <i>Relationship between mineralisation widths and intercept lengths</i> | <ul style="list-style-type: none"> <i>These relationships are particularly important in the reporting of Exploration Results.</i> <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> | <ul style="list-style-type: none"> <i>Not applicable to this announcement</i> |
| <i>Diagrams</i> | <ul style="list-style-type: none"> <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> | <ul style="list-style-type: none"> <i>Diagrams illustrating key seismic sections are presented in the body of the text.</i> |

| | | |
|---|---|--|
| <i>Balanced reporting</i> | <ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. | <ul style="list-style-type: none"> The accompanying document is considered to be a balanced and representative report. |
| <i>Other substantive exploration data</i> | <ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | <ul style="list-style-type: none"> Results are compared with previous drilling and soil sampling programmes. |
| <i>Further work</i> | <ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. | <ul style="list-style-type: none"> Future work will include deep diamond drilling to corroborate the results of the seismic interpretation and to determine that the basin contains the essential mineral system components to host large copper-silver deposits. |
