

CHALLENGER GOLD DOUBLES ECUADOR RESOURCE TO 9.1¹ MILLION OUNCES GOLD EQUIVALENT²

Highlights

- **Mineral Resource Estimate ('MRE') at Challenger Gold's Ecuador projects increased from 4.5 to 9.1 Moz¹ AuEq² - a 100% growth milestone (Refer Table 1).**
- **Attributable resource to CEL 6.9 Moz AuEq² across El Guayabo (100%) and Colorado V (50%).**
- **Significant upside remains: The resource is based on drilling 5 of the 15 major anomalies, with all 13 anomalies drilled returning mineralisation.**
- **Completion of exploration in Ecuador enables the Company to commence the value realisation process, including strategic divestment options.**

¹ Reported on total project basis attributable resource to CEL of 6.9Moz AuEq

² Reported as Gold Equivalent (AuEq) values – for requirements under the JORC Code see page 5

³ Refer Table 7 for Hualilan Gold Project MRE and gold equivalent requirements under the JORC Code

Commercial Advantages of the Project

1. Large-Scale Opportunity:

The updated MRE positions Challenger Gold's Ecuador assets among the largest undeveloped gold resources in South America, with **567Mt @ 0.50g/t AuEq for 9.1Moz AuEq** on a total project basis.

2. Premium High-Grade Core Enhances Economics:

The resource includes a **higher-grade core of 2.1 Moz @ 1.0g/t AuEq**, including **1.2 Moz @ 1.2g/t AuEq**, offering potential for early-stage production and strong cash flow generation.

3. Strategic Location Validates District Potential:

The projects are adjacent to Lumina Gold's **20.5Moz Cangrejos project⁴**, which recently secured a **\$300M financing deal with Wheaton Precious Metals**, confirming the district's world-class potential as a globally significant gold-copper region.

⁴ Source: Lumina Gold NI 43-101 PFS Report Cangrejos Project April 2023

4. Development-Ready Infrastructure:

Located just **35km from a deepwater port** with existing power, water, and road access on granted Mining Leases, the project benefits from reduced development costs and logistical efficiencies.

Value Realisation Strategy for Ecuador

Challenger Gold Limited plans to unlock the value of its Ecuador assets through several strategic options:

- **TSX Listing:** Spin off the Ecuador projects into a standalone entity listed on the TSX, where similar projects trade at premium valuations compared to ASX-listed peers.
- **Strategic Sale:** Divest the assets outright which could generate immediate capital for advancing Challenger's flagship Hualilan Gold Project in Argentina.
- **Farm-In Partnership:** Partner with a major mining company to fund development while retaining exposure through royalties or equity participation.

Focus on the Hualilan Gold project

The upgraded MRE concludes Challenger Gold Limited's exploration program in Ecuador, enabling the Company to focus entirely on advancing its flagship Hualilan Gold Project in Argentina, which features:

- A total resource of 2.8Moz AuEq¹, including a high-grade core of 1.5 Moz @ 5.6g/t AuEq¹
- Mineralisation which remains open in all directions
- A toll milling Agreement to capitalise on the current high gold price (above US\$3,000/oz) to generate early cash flow
- This cashflow will be allocated towards the construction of the standalone Hualilan Gold project
- Positioning Hualilan as one of South America's premier near-term production opportunities

Monetisation of the Ecuador assets will ensure shareholders benefit directly from both value realisation in Ecuador and production growth at Hualilan.

¹ Refer Table 7 for Hualilan Gold Project MRE and gold equivalent requirements under the JORC Code

Commenting on the resource, CEL Managing Director, Mr Kris Knauer, said

"I would like to congratulate our exploration team in Ecuador for their outstanding work in doubling project resources from 4.5Moz to 9.1Moz AuEq, including a high-grade core of 2.1Moz at 1.0g/t AuEq.

This resource update represents a transformational milestone for Challenger Gold shareholders, enabling us to move forward with unlocking significant value from our Ecuador assets while focusing entirely on bringing our flagship Hualilan project into production.

This is only the beginning for the asset – the current resource is based on drilling just five of fifteen major anomalies identified across our Ecuador projects, with all thirteen anomalies drilled so far returning significant mineralisation."

For personal use only

Challenger Gold Limited (ASX: CEL) (“CEL” or the “Company”) is pleased to announce the Mineral Resource Estimate (“MRE”) at CEL’s Ecuador projects has increased from **4.5 to 9.1 million ounces gold equivalent¹**. The combined 9.1 Moz MRE at El Guayabo (CEL 100%) and Colorado V (CEL 50%) comprises **570.3 mt at 0.50 g/t AuEq** (0.36 g/t Au, 2.2 g/t Ag, 0.07% Cu, 9.7 ppm Mo) for **9.1 Moz AuEq**. This 9.1 Moz MRE includes;

- a total maiden MRE of **4.4 million ounces gold equivalent¹ at a grade of 0.50 g.t AuEq^{1,2}** (0.35 g/t Au, 2.2 g/t Ag, 0.08% Cu, 14.3 ppm Mo) for the Colorado V Project (CEL 50%); and an
- updated MRE of **4.7 million ounces gold equivalent¹ at 0.50 g/t AuEq¹** (0.38 g/t Au, 2.3 g/t Ag, 0.06% Cu, 7.5 ppm Mo) at the adjoining 100% owned El Guayabo Project.

The Company has now earned an initial 50% interest in the Colorado V Project. Net attributable resources to CEL across both projects are **6.9 Moz AuEq¹ - 431 mt at 0.50 g/t AuEq^{1,2} (0.37 g/t Au, 2.3 g/t Ag, 0.07% Cu, 10 ppm Mo)**.

The 9.1 Moz MRE is based on drilling five of the fifteen regionally significant Au-Cu soil anomalies identified across the project (Figure 1). All 13 Au-Cu soil anomalies drilled to date have returned significant mineralisation.

At Colorado V, the maiden MRE is based on drilling over the CV-A anomaly and the southern portion of CV-B. Mineralisation remains open in both directions along strike and at depth at both CV-A and CV-B. Results on the northern half of the CV-B anomaly include **504.3m at 0.3 g/t AuEq** including **276.1m at 0.4 g/t AuEq and 116.1m at 0.5 g/t AuEq** however, the drill density was insufficient to allow the reporting of an MRE in accordance with the JORC Code in the northern half of CV-B.

The updated El Guayabo resource included four additional drillholes for 2594 metres and an additional 3058 metres of underground and surface channel sampling that was completed after the previous MRE cut-off date. The El Guayabo MRE includes the GY-A, GY-B, and GY-C anomalies on the Company’s 100% owned El Guayabo concession.

Mineralisation remains open in both directions along strike and at depth on all five anomalies where drilling has been of sufficient density to allow the reporting of an MRE. There is clear potential for significant growth in the MRE, not only via additional drilling on these five anomalies, but also across the remaining 10 mineralised anomalies that have yet to be tested by resource drilling.

Table 1 shows the classification of the MRE and the breakdown between the in-pit and underground component of the 9.1Moz MRE. There is a discrete higher-grade component to the resource. This higher-grade component of the MRE comprises (see Table 2 Grade Tonnage data):

2.1 Moz at 1.0 g/t AuEq^{1,2} - 65.7 Mt at 0.8 g/t Au, 3.4 g/t Ag, 0.11% Cu, 9.4ppm Mo (0.70 g/t AuEq cut-off)
1.2 Moz at 1.2 g/t AuEq^{1,2} - 31.7 Mt at 1.0 g/t Au, 4.1 g/t Ag, 0.13% Cu, 7.3ppm Mo (0.85 g/t AuEq cut-off)
0.8 Moz at 1.4 g/t AuEq^{1,2} - 17.7 Mt at 1.1 g/t Au, 4.8 g/t Ag, 0.17% Cu, 6.9ppm Mo (1.0 g/t AuEq cut-off)

¹ Reported on total project basis attributable resource to CEL of 6.9Moz AuEq

² Reported as Gold Equivalent (AuEq) values – for requirements under the JORC Code see page 5

Table 1 Combined El Guayabo and Colorado V MRE

¹ Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1800 Oz, Ag US\$22 Oz, Cu US\$9,000/t, Mo US\$44,080/t
- Metallurgical recoveries are estimated to be Au (85%), Ag (60%), Cu (85%) Mo (50%) across all ore types (see **JORC Table 1 Section 3 Metallurgical assumptions**) based on metallurgical test work.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times 0.012222] + [Cu (\%) \times 1.555] + [Mo (\%) \times 4.480026]$
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

EL GUAYABO AND COLORADO V PROJECT GEOLOGY

The El Guayabo Project comprises 3609 Ha (36.1 km²) of Exploitation (mining) Licenses valid until 2028 with an automatic 20-year renewal. These mining licenses are held via a combination of outright ownership, farmin agreements and options to acquire as outlined below. The current 9.1 Moz Gold Equivalent is located almost across the Company's 100% owned El Guayabo concession, the Cerro Pelado concession where CEL has the option to acquire 100%, and the Colorado V concession where CEL has earned an initial 50% interest in the MRE.

- El Guayabo concession (257 Ha) - 100% owned
- Cerro Pelado concessions (61 Ha) - option to acquire 100%
- El Guayabo 2 concession (957 Ha) - earning 80% with option to move to 100%
- Colorado V concession (2331 Ha) - earned an initial 50% interest

For personal use only

The completion of the maiden MRE at Colorado V completes CEL's requirements under the farm-in to earn a 50% Interest in the MRE. CEL and the current owner will then jointly fund a Definitive Feasibility Study and ongoing development.

Location and Logistics

Colorado V and El Guayabo are located within the El Oro Province of southern Ecuador, 35 Kilometers southeast of the port city of Machala, Ecuador's fourth largest city and the capital of El Oro Province. Machala city lies on the Pan-American Highway linking Guayaquil to Lima in Peru. The port of Puerto Bolivar, a deepwater commercial port, is located 9 km to the west of Machala. The projects are coastal at an elevation of less than 1000 metres and are covered by a mix of pasture with some secondary regrowth forest. Exploration conditions are excellent with field exploration possible all year round as is exploration drilling 24 hours a day. The projects have power, water and internet coverage to site.

The projects adjoin the 20.5-million-ounce Cangrejos Gold Project⁴ owned by Lumina Gold (TSX : LUM). Cangrejos, El Guayabo, and Colorado V have the same geology, surface footprint, and mineralisation style, and are interpreted as being part of the same system. Lumina Gold has released the results of a Pre-Feasibility Study for Cangrejos. Additionally, in May 2024 Lumina announced it had entered into an agreement with Wheaton Precious Metals for Wheaton to provide Lumina US\$300M financing via a Gold Stream for Cangrejos.

Geology of El Guayabo and Colorado V Projects

The project geology comprises a metamorphic basement (El Oro Metamorphic Complex) of Cretaceous age intruded by nested intermediate alkaline intrusives which are Tertiary in age from 40 – 10 Ma (million years). The nested intrusions are commonly intruded by later mineralized intrusions, porphyry dykes and intrusive breccias of late Oligocene to Miocene age, suggesting deeper, evolving magmatic systems are feeding shallower systems.

The Project contains a “Low Sulphide” porphyry gold copper system. The Au-Ag-Cu-Mo mineralisation in the El Guayabo concession is associated with mineralized diorite intrusions exhibiting local porphyry stock work veining and associated intrusive breccias that are structurally controlled on a dominant NE/SW trend and many times on the intersection of NW/SE secondary trend.

The Colorado V concession which is approximately 750 metres deeper in the system (Figure 4) is a high-level porphyry intrusive and intrusive-related breccia complex with mineralisation controlled by regional scale and local scale fault-fracture zones, breccia zones and lithology contacts.

Soil geochemistry conducted by the Company produced 15 regionally significant Au-Cu soil anomalies across the Colorado V and El Guayabo concessions. Exploration drilling on 13 of the soil anomalies has been completed with all holes intersecting mineralisation (Figure 1).

RESOURCE MODEL AND MINERAL RESOURCE ESTIMATE

Pit Optimisation Parameters

A 0.30 g/t AuEq lower cut-off grade inside an US\$2000 oz Au optimised pit shell has been used to report that part of both the Colorado-V and updated El Guayabo MRE that has reasonable prospects of future economic extraction via surface mining. The pit optimisation parameters are outlined in Table 3 (over the page). They reflect internally researched costs and assumptions for similar style projects in Ecuador and are reasonable for the prospect of eventual extraction.

Pit slopes of 47.5° were used in the surface optimisation. Detailed geotechnical work has yet to be completed, however the Company notes this is the Pit slope to be employed at Cangrejos which is interpreted as part of the same mineralised system as the El Guayabo and Colorado V Projects.

The average metallurgical recoveries used for gold (85%), silver (60%), copper (85%), and molybdenum (50%) were derived by benchmarking nearby deposits in Ecuador most notably the Cangrejos Project. Concentrate payability was taken from ongoing discussions the Company has had with concentrate off-takers including smelters and trades. The gold equivalents reflect the updated metal recoveries.

Resources below the optimised surface shell have been reported as an Inferred Resource at a 0.4 g/t AuEq cut-off. Based on the grade, distribution, orientation, and dimensions of the underground mineralisation this is considered to have reasonable prospects of future economic extraction via bulk underground mining methods.

Metal Prices	Value
Au price	US\$2000 oz
Ag price	US\$24 oz
Cu price	US\$9000t
Mo price	US\$20/lb
Mining and Processing	
Mining Cost	US\$2.00/t
Processing Cost	US\$7.00/t
GA	US\$0.80/t
Sustaining Capex	US\$0.60/t
Total processing	US\$8.40t
Mining losses	0%
Mining dilution	0%
Pit Slope	47.5 degrees
Metallurgical recoveries	
Au	85%
Ag	60%
Cu	85%
Mo	50%
Other	
Ecuadorian Government Royalty	3% NSR
Refining and Transport	\$60 oz AuEq
Density for mineralisation	2.73 g/cm ³
Density for waste	2.73 g/cm ³

Table 3 - Pit Optimisation Parameters

COLORADO V MAIDEN MINRAL RESOURCE ESTIMATE

The Colorado V MRE has been generated from CEL diamond drill holes, results from an underground channel sampling campaign completed by CEL and historic drill holes results that have been validated and verified by CEL with core re-sampling and re-assay. Halved drill core is sampled over intervals from 0.5 to 2.0 metres according to lithology and alteration contacts. Data used is shown in Table 4.

The Colorado-V rock-saw sampling is done using a rock saw to cut and recover a continuous channel measuring approximately 4cm x 4cm along any outcrop. The 4cm x 4cm sample weight averages 4.8 kg per metre, approximately the same as the NQ sized drill core in the El Guayabo Project drill program. The samples are logged and submitted for assay with QAQC samples (duplicates, blanks and standards) using the same procedure as drill core. It is expected that the data can be incorporated into a resource estimation in the same way as drilling results.

Company	Sample Type	Status	Num. Holes	Metres Drilled
Gold King	Diamond core	Historic	44	14,186
Gold King	Diamond core	Historic with re-assays	26	11,151
CEL	Diamond core	Executed	25	17,237
CEL	Diamond core	Executed GK	4	2,090
CEL	Channel	Executed	27	928
			126	45,592

Table 4 - Data used in maiden Colorado V MRE

Domains

Two separate mineralised domains were wireframed using drill hole data loaded in Micromine Origin and Leapfrog.

1. A NE striking (025°) domain that encompasses the CV-A and CV-B surface geochemical anomalies. Geological mapping (surface and underground) and drill core geological logging indicates a steeply north-west dipping (85°), north-east striking control on mineralisation. The wireframe for this domain was built in Leapfrog using a 0.2 AuEq isosurface to limit the extent of blocks that can be included in the resource
2. A SE striking (120°), steeply NE dipping domain that terminates the SW end of the NE striking domain. This domain includes the Humedo adit and associated workings. Within this domain, a steeply plunging mineralised shoot (75° to the south-east) is developed. The wireframe for this domain was built using the RBF tool in Micromine using a 0.2 AuEq isosurface to limit the extent of blocks that can be included in the resource.

Each broad domain was constrained by interpreted geological continuity with mineralisation > 0.2 g/t AuEq and a 200 metre range to limit the extent of the mineralisation in each domain. A 2 metre composite length was selected after reviewing the composite statistics.

For personal use only

Top Cutting

Domain top cuts were applied to the 2 domains for each element in order to reduce the influence of extreme values on the MRE without downgrading the high-grade composites too severely.

The top-cut values were chosen by assessing the high-end (tail) of the grade population within each group and where necessary, selecting the uppermost outlier value above which the distribution became too heavily skewed. The top cuts applied in each of the four domains are shown in Table 5.

Domain	Au Top-cut (g/t)	Ag Top-cut (g/t)	Cu Top-cut (%)	Mo Top-cu (ppm)t
100	3	n/a	n/a	150
200	5	20	n/a	30

Table 5 - Top cuts Applied to each Domain (n/a; no top cut applied)

Block Model and Estimation

A block model was set up in Surpac™ V6.6 software with a cell size of 20m (E) x 20m (N) x 20m (RL) for both domains. Variography was carried out using Leapfrog Edge software on the composited data from each of the two domains for each variable. Variograms were modelled in three directions for each domain and each element as well as a downhole direction.

Assumed density is 2.73 g/cm³ (2.730 g/cc) which is the median SG value of 410 representative samples of core that were made during the core logging process. The SG values measured had a tight range which was independent of lithology and assay values.

No previous JORC Resource estimates or non-JORC Foreign Resource estimates were made with similar methods to compare to the current MRE. No production records are available to provide comparisons.

Within each domain, estimation was made for Au Ag, Cu and Mo being the elements of economic interest. All of the relevant variables; Au, Ag, Cu and Mo in each domain were estimated by applying Ordinary Kriging using only data from within that domain. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures. An oriented “ellipsoid” search for each domain was used to select data for interpolation. Estimation search ellipse ranges were adjusted for each element in each domain based on the variogram ranges.

Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades for northings, eastings and elevation. These checks show good correlation between estimated block grades and drill sample grades.

For personal use only

A Lerchs-Grossman pit optimisation routine using inputs as described in Table 3 was used to determine that blocks > 0.3 g/t AuEq have reasonable prospects of future economic extraction by surface mining. Further models using similar input variable were used to identify a near surface optimised shell that was used to report the MRE at > 0.3 g/t AuEq block cut-off. Below the optimised shell, blocks > 0.4 g/t AuEq are considered to have reasonable prospects of future economic extraction by bulk underground mining techniques.

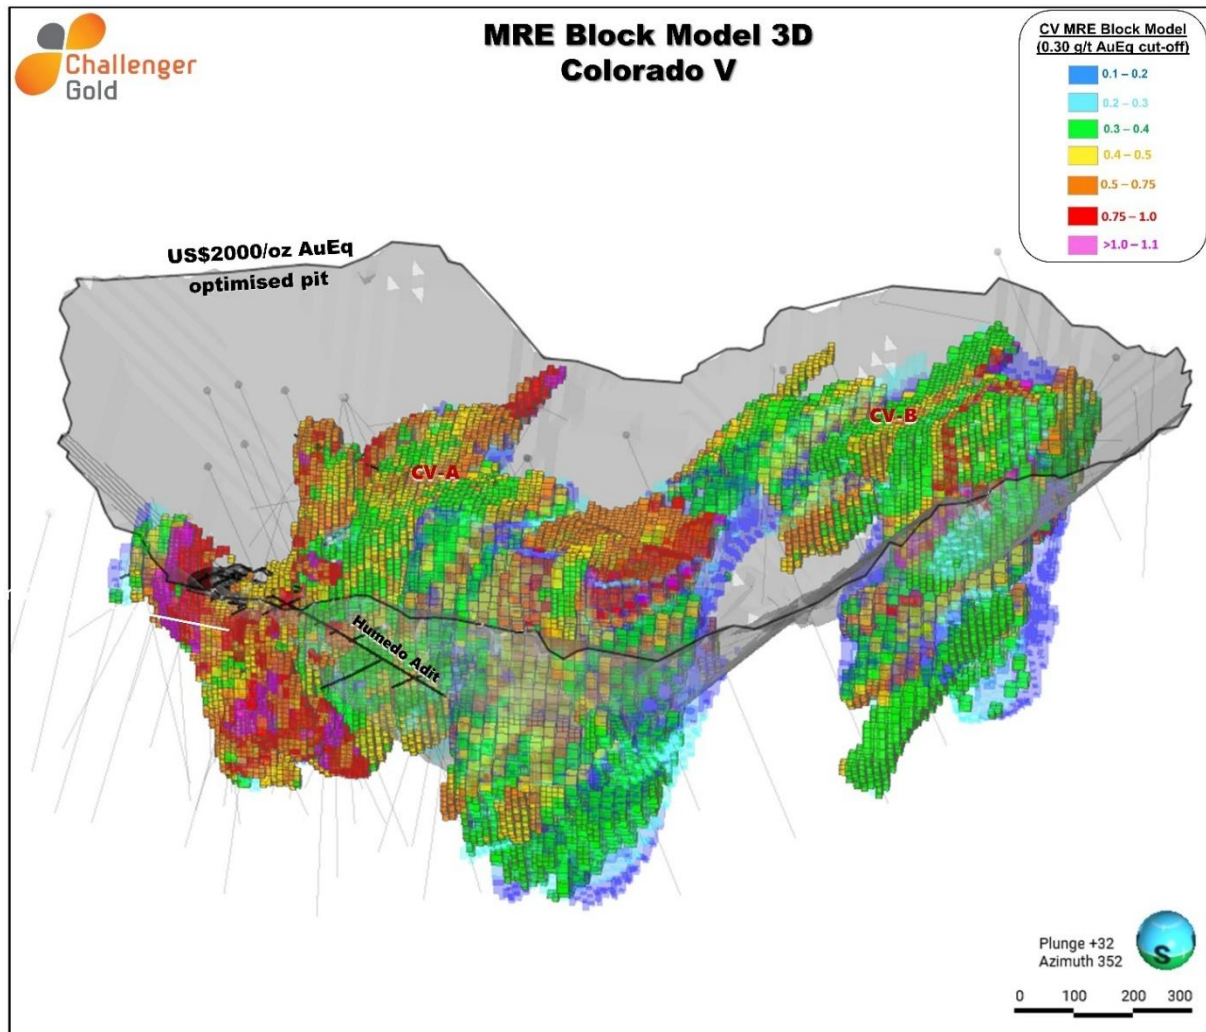

Figure 8 - View CV-A and CV-B MRE block models and the US\$2000 AuEq optimised pit shell

Resource Classification

The Mineral Resource has been classified as Indicated and Inferred based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters.

For personal use only

The Colorado V deposit was sampled by drilling at nominal 100m spacing along strike. The central part of the northern domain has been infilled providing the confidence to upgrade this area to Indicated category.

A typical section through CV-A are given in Figures 2, and Figure 3 with Figure 5 a typical section through CV-B.

EL GUAYABO UPDATED MINERAL RESOURCE ESTIMATE

The El Guayabo MRE was updated using the results from

- an additional 4 diamond core drill holes for 2594 metres; and
- 3058 metres of surface and underground channel sampling;

for which assays were received after the 10 May 2023 cut off for the maiden El Guayabo MRE.

The rock-saw sampling is done using a rock saw to cut and recover a continuous channel measuring approximately 4cm x 4cm along any outcrop. The 4cm x 4cm sample weight averages 4.8 kg per metre, approximately the same as the NQ sized drill core in the El Guayabo Project drill program. The samples are logged and submitted for assay with QAQC samples (duplicates, blanks and standards) using the same procedure as drill core. It is expected that the data can be incorporated into a resource estimation in the same way as drilling results.

The Resource estimate also used results from a CEL surface and underground channel sampling campaign and historic drill holes results that have been verified by CEL re-assaying, drilling and geological modelling. Halved drill core is sampled over intervals from 0.5 to 2.0 metres according to lithology and alteration contacts.

Four separate mineralised domains were wireframed using drill hole data loaded in Micromine Origin and Leapfrog. Two lower-grade domains each with separate internal higher-grade domains which were designed to limit the influence of the high-grade assays. Each broad domain was constrained by interpreted geological continuity with mineralisation > 0.2 g/t AuEq and a 200 metre range to limit the extent of the mineralisation in each domain. The high-grade domains were constrained by interpreted geological continuity with sample mineralisation > 0.7 g/t AuEq.

The average length of a sample in the mineralised domains is approximately 1.5 metres. Three metre composites were used in the lower-grade domains with two metre composites in higher-grade sub-domains. Within each domain, estimation was made for Au Ag, Cu and Mo being the elements of economic interest.

Assumed density is 2.73 g/cm³ (2.730 g/cc) which is the median SG value of 379 representative samples of core that were made during the core logging process. The SG values measured had a tight range which was independent of lithology and assay values.

For personal use only

A block model was set up in Surpac™ V6.6 software with a parent cell size of 20m (E) x 20m (N) x 20m (RL) was used in the two broad lower-grade domains with sub-blocks to 10m (E) x 10m (N) x 10m (RL) to maintain the resolution of the mineralised domains. A parent cell size of 10m (E) x 10m (N) x 10m (RL) in the two higher-grade sub-domains. Variography was carried out using Leapfrog Edge software on the composited data from each of the 4 domains for each variable.

All of the relevant variables; Au, Ag, Cu and Mo in each domain were estimated by applying Ordinary Kriging using only data from within that domain. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures. An oriented “ellipsoid” search for each domain was used to select data for interpolation.

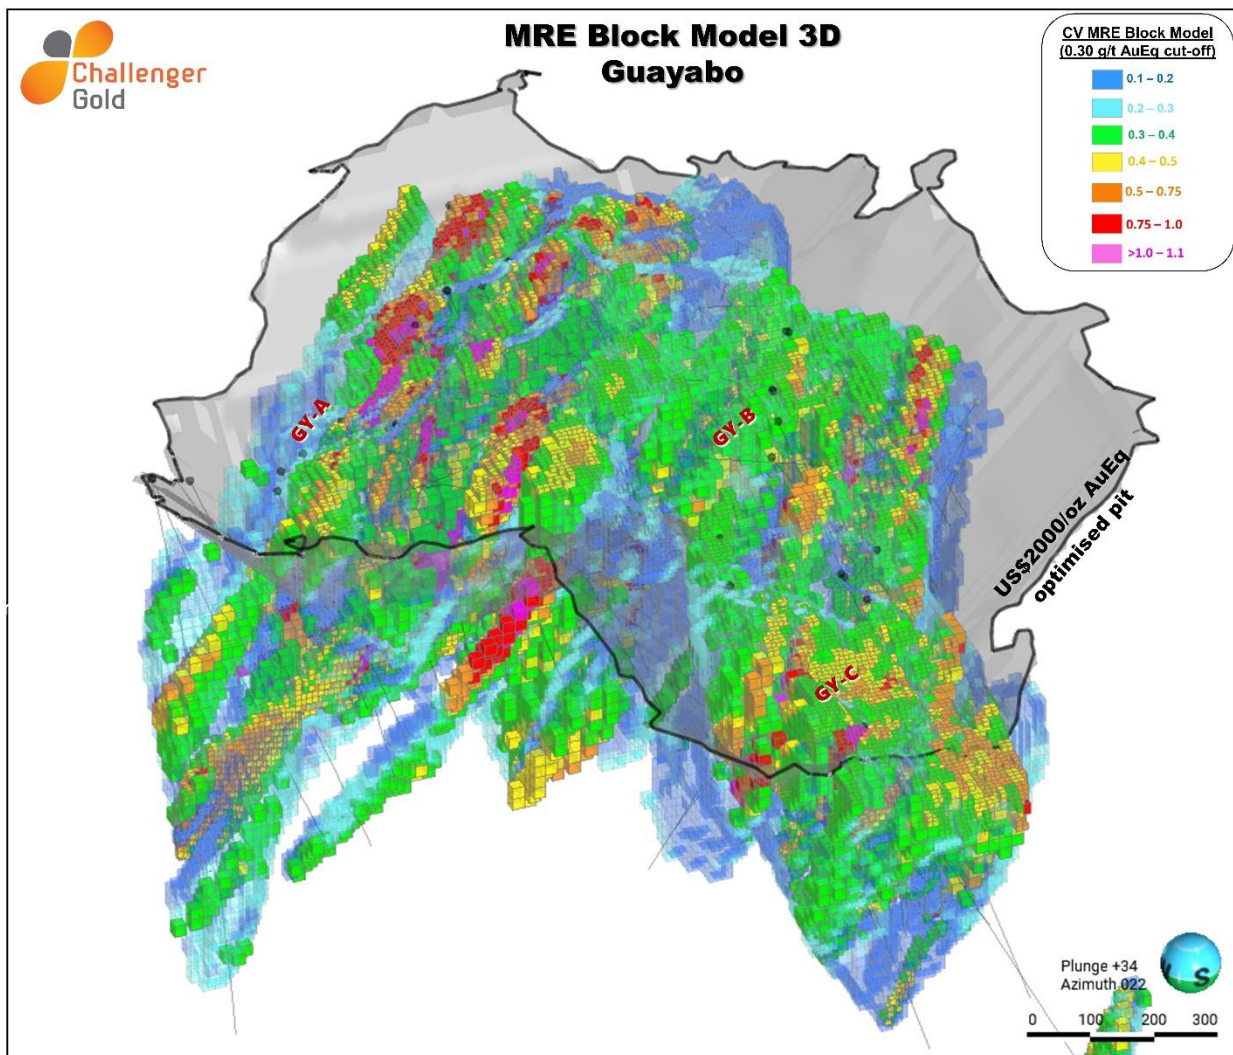

Figure 9 - View GY-A, GY-B and GY-C MRE block model and the US\$2000 AuEq optimised pit shell

For personal use only

The estimation search strategy was undertaken in one pass with classification of the resource into Inferred category.

Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades for northings, eastings and elevation. These checks show good correlation between estimated block grades and drill sample grades.

A Lerchs-Grossman pit optimisation routine using inputs as described in Table 4 was used to determine that blocks > 0.3 g/t AuEq have reasonable prospects of future economic extraction by surface mining. Further models using similar input variable were used to identify a near surface optimised shell that was used to report the MRE at > 0.3 g/t AuEq block cut-off. Below the optimised shell, blocks > 0.4 g/t AuEq are considered to have reasonable prospects of future economic extraction by bulk underground mining techniques.

Top Cuts

A statistical analysis was undertaken on the sample composites with top cuts initially applied to the Au, Ag, Cu and Mo composites on a domain-by-domain basis.

Top cuts were applied to the grouped domains in order to reduce the influence of extreme values on the MRE without downgrading the high-grade composites too severely. The top-cut values were chosen by assessing the high-end distribution (tail) of the grade population within each group and selecting the uppermost outlier value above which the distribution became too heavily skewed. The top cuts applied in each of the four domains are shown in Table 6.

Domain	Au Top-cut (g/t)	Ag Top-cut (g/t)	Cu Top-cut (%)	Mo Top-cu (ppm)t
2 - GY-A Low Grade Domain	5	11	n/a	100
3 - GY-B Low Grade Domain	4	11	n/a	100
22 - GY-A High-Grade sub-domain	10	70	n/a	200
23 - GY-B High-grade sub domain	11	70	n/a	150

Table 6 - Top cuts Applied to each Domain (n/a; no top cut applied)

NEXT STEPS

The Company has previously announced that it intends to monetise its Ecuador assets to focus on the near-term high-grade production opportunity at CEL's flagship Hualilan Gold project. The Company has determined little value is currently attributed by the market to the existing 6.9 Moz AuEq¹ net MRE and the substantial exploration potential of its Ecuadorian assets as they currently stand.

¹ Reported as Gold Equivalent (AuEq) values – for requirements under the JORC Code see page 5

With the completion of the maiden Colorado-V and upgrade of the El Guayabo MRE the Company is now positioned to advance the monetisation process. Monetisation options include listing the Company's Ecuador assets on the Toronto Stock Exchange (or other recognised international exchange), a trade sale or farm-in.

This ASX release was approved by the CEL Board.

Previous announcements referred to in this release include:

The Mineral Resource Estimate for the Hualilan Gold Project was first announced to the ASX on 1 June 2022 and updated 29 March 2023. The Mineral Resource Estimate for the El Guayabo Project was first announced to the ASX on 14 June 2023. The Company confirms it is not aware of any information or assumptions that materially impacts the information included in that announcement and that the material assumptions and technical parameters underpinning the Mineral Resource Estimate continue to apply and have not materially changed.

ADDITIONAL INFORMATION

COMPETENT PERSON STATEMENT – EXPLORATION RESULTS AND MINERAL RESOURCES

The information that relates to sampling techniques and data, exploration results, geological interpretation and Mineral Resource Estimate has been compiled Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results and Mineral Resources. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

FORWARD LOOKING STATEMENTS

The announcement may contain certain forward-looking statements. Words 'anticipate', 'believe', 'expect', 'forecast', 'estimate', 'likely', 'intend', 'should', 'could', 'may', 'target', 'plan', 'potential' and other similar expressions are intended to identify forward-looking statements. Indication of, and guidance on, future costings, earnings and financial position and performance are also forward-looking statements.

Such forward looking statements are not guarantees of future performance, and involve known and unknown risks, uncertainties and other factors, many of which are beyond the control of Challenger Gold Ltd, its officers, employees, agents and associates, which may cause actual results to differ materially from those expressed of implied in such forward-looking statements. Actual results, performance, or outcomes may differ materially from any projections or forward-looking statements or the assumptions on which those statements are based.

You should not place any undue reliance on forward-looking statements and neither. Challenger nor its directors, officers, employees, servants or agents assume any responsibility to update such information. The stated Production Targets are based on the Company's current expectations of future results or events and should not be relied upon by investors when making investment decisions. Further evaluation work and appropriate studies are required to establish sufficient confidence that this target will be met.

Financial numbers, unless stated as final, are provisional and subject to change when final grades, weight and pricing are agreed under the terms of the offtake agreement. Figures in this announcement may not sum due to rounding.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates in the relevant original market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

HUALILAN GOLD PROJECT MRE AND SCOPING STUDY

All references to the Scoping Study and its outcomes in this announcement relate to the ASX Announcement of 8 November 2023 'Hualilan Gold Project Scoping Study'. Please refer to that announcement for full details and supporting documentation.

Table 7: Hualilan Hold Project Mineral Resource Estimate (March 2023)

Domain	Category	Mt	Au (g/t)	Ag (g/t)	Zn (%)	Pb (%)	AuEq (g/t)	AuEq (Mozs)
US\$1800 optimised shell > 0.30 ppm AuEq	Indicated	45.5	1.0	5.1	0.38	0.06	1.3	1.9
	Inferred	9.6	1.1	7.3	0.43	0.06	1.4	0.44
Below US\$1800 shell >1.0ppm AuEq	Indicated	2.7	2.0	9.0	0.89	0.05	2.5	0.22
	Inferred	2.8	2.1	12.4	1.1	0.07	2.8	0.24
Total		60.6	1.1	6.0	0.4	0.06	1.4	2.8

Note: Some rounding errors may be present

¹ **Gold Equivalent (AuEq) values - Requirements under the JORC Code**

- Assumed commodity prices for the calculation of AuEq is Au US\$1900 Oz, Ag US\$24 Oz, Zn US\$4,000/t, Pb US\$2000/t
- Metallurgical recoveries are estimated to be Au (95%), Ag (91%), Zn (67%) Pb (58%) across all ore types (see **JORC Table 1 Section 3 Metallurgical assumptions**) based on metallurgical test work.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times 0.012106] + [Zn (\%) \times 0.46204] + [Pb (\%) \times 0.19961]$
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

JORC Code, 2012 Edition – Table 1 Report Template

Section 1: Sampling Techniques and Data -El Guayabo Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"> - <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> - <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> - <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> - <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i> 	<p>CEL Drilling (El Guayabo and Colorado V):</p> <ul style="list-style-type: none"> • CEL have drilled HQ diamond core which is sampled by cutting the core longitudinal into two halves. One half is retained for future reference and the other half is sent for sampling. • Sampling is done according to the geology. Sample lengths range from 0.5 to 2.5 metres. The average sample length is 1.5m. Samples are prepared at SGS Laboratories in Guayaquil for 30g fire assay and 4-acid digest ICPMS and then assayed in SGS Lima. • The sample size is considered representative for the geology and style of mineralisation intersected. All the core is sampled for assay. <p>Historic Drilling (El Guayabo):</p> <ul style="list-style-type: none"> • Newmont Mining Corp (NYSE: NEM) ("Newmont") and Odin Mining and Exploration Ltd (TSX: ODN) ("Odin") core drilled the property between February 1995 and November 1996 across two drilling campaigns. • The sampling techniques were reviewed as part of a 43-101 Technical report on Cangrejos Property which also included the early results of the El Joven joint venture between Odin and Newmont, under which the work on the El Guayabo project was undertaken. This report is dated 27 May 2004 and found the sampling techniques and intervals to be appropriate with adequate QA/QC and custody procedures, core recoveries generally 100%, and appropriate duplicates and blanks use for determining assay precision and accuracy. • Duplicates were prepared by the Laboratory (Bonder Cleg) which used internal standards. Newmont also inserted its own standards at 25 sample intervals as a control on analytical quality • Diamond drilling produced core that was sawed in half with one half sent to the laboratory for assaying per industry standards and the remaining core retained on site. • Cu assays above 2% were not re-assayed using a technique calibrated to higher value Cu results hence the maximum reported assay for copper is 2%. • All core samples were analysed using a standard fire assay with atomic absorption finish on a 30 g charge (30 g FAA). Because of concerns about possible reproducibility problems in the gold values resulting from the presence of coarse gold, the coarse crusher rejects for all samples with results greater than 0.5 g/t were re-assayed using the "blaster" technique - a screen type fire analysis based on a pulverized sample with a mass of about 5 kg. Samples from most of these intersections were also analysed for Cu, Mo, Pb, Zn and Ag. • CEL has re-sampled sections of the Newmont and Odin drill core. ¼ drill core was cut over intervals that replicated the earlier sampling. Sample intervals ranged from 0.7 – 4.5m with an average of 2.0m. 533 samples

Criteria

JORC Code explanation

Commentary

totaling 1,094.29m were collected. Sampling was done for Au analysis by fire assay of a 30g charge and 43 element 4-acid digest with ICP_AES determination.

- Field mapping (creek traverse) by CEL includes collection of rock chip samples for assay for Au by fire assay (50g) with AAS determination and gravimetric determination for values > 10 g/t Au and assay for 48 elements by 4-acid digest with ICP-MS determination. Rock chip samples are taken so as to be as representative as possible of the exposure being mapped.

Colorado V:

- Soil sampling: A database of 4,495 soil analyses has been provided by Goldking Mining Company S.A. (GK). No information has been provided on the method of sample collection or assay technique. The soil analyses include replicate samples and second split analyses. Pulps have been securely retained by Goldking Mining Company and have been made available to CEL for check assay. Check assaying is planned, including repeat sampling.
- Rock chip sampling during regional mapping has been done on selected exposures. Sampling involves taking 2-3 kg of rock using a hammer from surface exposures that is representative of the exposure.
- Selected intervals of drill core have been cut longitudinally and half core were submitted for gold determination at GK's on-site laboratory prior to CEL's involvement with the Project.
- Re-sampling of the core by CEL involves taking ¼ core (where the core has previously been sampled) or ½ core (where the core has not previously been sampled). The core is cut longitudinally and sample intervals of 1 – 3 meters have been collected for analysis. ZK0-1 and ZK1-3 have been analysed for gold by fire assay (30g) with ICP determination and other elements by 4 acid digest with ICP-AES finish (36 elements) at SGS del Peru S.A.C. SAZK0-1, SAZK0-2, SAZK2-1, ZK0-2, ZK0-5, ZK1-5, ZK1-6, ZK2-1, ZK3-1, ZK3-4, ZK13-1 and ZK18-1 have been analysed for of gold by fire assay (30g) with ICP determination and other elements by 4 acid digest with combined ICP-AES and ICP-MS finish (50 elements) at SGS del Peru S.A.C. Samples from other holes have been analysed for gold by fire assay (30g) with ICP determination and overlimit (>10 g/t Au) by fire assay with gravimetric determination and other elements by 4-acid digest with ICP-MS (48 elements) at ALS Laboratories in Peru.
- Underground development has been mapped and channel sampled. Channel samples have been taken by cutting a horizontal channel of approximately 5 cm width and 4 cm depth into the walls at a nominal height of 1m above the ground. The channel cuts were made with an angle grinder mounted with a diamond blade. Samples were extracted from the channel with a hammer and chisel to obtain a representative sample with a similar weight per metre as would be obtained from a drill core sample. Analysis of the samples has been done by ALS Laboratories in Peru using the same preparation and analysis as has been used for drill core samples.

Criteria	JORC Code explanation	Commentary
----------	-----------------------	------------

Logging

- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.
- Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.
- The total length and percentage of the relevant intersections logged.

- All drill current drill core and all available historic drill core has been logged qualitatively and quantitatively where appropriate. All core logged has been photographed after logging and before sampling.
- Peer review of core logging is done to check that the logging is representative.
- 100% of all core including all relevant intersections are logged
- Progress of current and historic El Guayabo and Colorado V drill core re-logging and re-sampling is summarized below:

Historic EL Guayabo Drilling

Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> - If core, whether cut or sawn and whether quarter, half or all core taken. - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. - For all sample types, the nature, quality and appropriateness of the sample preparation technique. - Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. - Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. - Whether sample sizes are appropriate to the grain size of the material being sampled. 	<p>CEL (El Guayabo and Colorado V):</p> <ul style="list-style-type: none"> • For sampling, all core is cut using a diamond saw, longitudinally into two halves. One half is sampled for assay and the other retained for future reference. Where duplicate samples are taken, ¼ core is cut using a diamond saw to prepare two ¼ core duplicates. • The location of the cut is marked on the core by the geologist that logged the core to ensure the cut creates a representative sample. • The sample preparation technique is appropriate for the material being sampled <p>Historic:</p> <p>El Guayabo:</p> <ul style="list-style-type: none"> • Core was cut with diamond saw and half core was taken • All drilling was core drilling as such this is not relevant • Sample preparation was appropriate and of good quality. Each 1-3 m sample of half core was dried, crushed to a nominal – 10 mesh (ca 2mm), then 250 g of chips were split out and pulverized. A sub-sample of the pulp was then sent for analysis for gold by standard fire assay on a 30 g charge with an atomic absorption finish with a nominal 5 ppb Au detection limit. • Measures taken to ensure that the sampling is representative of the in-situ material collected is not outlined in the historical documentation however a program of re-assaying was undertaken by Odin which demonstrated the repeatability of original assay results • The use of a 1-3 m sample length is appropriate for deposits of finely disseminated mineralisation where long mineralised intersections are to be expected. • CEL ¼ core sampling was done by cutting the core with a diamond saw. Standards (CRM) and blanks were inserted into the batched sent for preparation and analysis. No duplicate samples were taken and ¼ core was retained for future reference. The sample size is appropriate for the style of mineralisation observed. • CEL rock chip samples of 2-3 kg are crushed to a nominal 2mm and a 500 g sub-sample is pulverized. The rock

		<p>chips are collected from surface expose in creeks. Sampling is done so as to represent the material being mapped. The sample size is appropriate for the grain size of the material being sampled.</p> <p>Colorado V:</p> <ul style="list-style-type: none"> No information is available on the method/s that have been used to collect the soil samples. Selected intervals of drill core have been cut longitudinally using a diamond saw and ½ core has been sampled. Sample intervals range from 0.1m to 4.5m with an average length of 1.35m. The size of the samples is appropriate for the mineralisation observed in the core. Re-sampling of the core involves cutting of ¼ core (where previously sampled) or ½ core where not previously sampled. ¼ or ½ core over intervals of 1-3 metres provides an adequate sample size for the material being sampled.
<p>Quality of assay data and laboratory tests</p>	<ul style="list-style-type: none"> <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> <i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> <i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i> 	<p>El Guayabo: CEL: Camp #1, Phase#1</p> <ul style="list-style-type: none"> All drill core collected by CEL has been crushed to a nominal 2mm size. A 500 g sub-sample has been pulverized to 85% passing 75 micron at the SGS Laboratory in Guayaquil. Sub-samples of the pulps have been analyzed by SGS for Au by Fire Assay (30g) with AAS determination and gravimetric determination where over limit. Sub-samples of the pulps are also assayed for a multi element suite by 4-acid digest with ICPMS determination (including Cu, Mo, Ag, Zn, Pb, S and Fe). All assay techniques are partial assays of the total sample. Samples submitted by CEL include standards (CRM), blanks and duplicate samples to provide some control (QAQC) on the accuracy and precision of the analyses. 6 different CRM pulp samples have been submitted with the core samples. All 6 are certified for Au, 2 are certified for Ag, 5 are certified for Cu, 1 is certified for Fe and 3 are certified for Mo. For Au, of 222 CRM pulp analyses, 215 are within +/- 2 SD (97%) For Ag, of 54 CRM pulp analyses, all are within +/- 2 SD (100%) For Cu, of 126 CRM pulp analyses, 125 are within +/- 2 SD (99%) For Mo, of 83 CRM pulp analyses, 81 are within +/- 2 SD (98%) For Fe, of 65 CRM pulp analyses, 63 are within +/- 2 SD (97%) 118 samples of pulp that are known to have a blank Au value have been included with the samples submitted. 16 samples returned Au values of >5 ppb (up to 11 ppb) indicating only mild instrument calibration or contamination during fire assay. 337 ¼ core duplicate samples have been submitted. The duplicate analyses for Au, Ag, Cu, Pb, Zn, As and Mo have been analysed. The duplicate sample analyses follow very closely the original analyses providing assurance that the sample size and technique is appropriate.

CEL: Camp #1, Phase#2

- All drill core collected by CEL has been crushed to a nominal 2mm size. A 500 g sub-sample has been pulverized to 85% passing 75 micron at the SGS Laboratory in Guayaquil. Sub-samples of the pulps have been analyzed by SGS for Au by Fire Assay (30g) with AAS determination and gravimetric determination where over limit. Sub-samples of the pulps are also assayed for a multi element suite by 4-acid digest with ICPMS determination (including Cu, Mo, Ag, Zn, Pb, S and Fe). All assay techniques are partial assays of the total sample.
- Samples submitted by CEL include standards (CRM), blanks and duplicate samples to provide some control (QAQC) on the accuracy and precision of the analyses.
- 7 different CRM pulp samples have been submitted with the core samples. All 7 are certified for Au, 3 are certified for Ag, All 7 are certified for Cu, 1 is certified for Fe and 4 are certified for Mo.
- **For Au, of 453** CRM pulp analyses, 445 are within +/- 2 SD (98%)
- **For Ag, of 155** CRM pulp analyses, 150 are within +/- 2 SD (97%)
- **For Cu, of 453** CRM pulp analyses, 444 are within +/- 2 SD (98%)
- **For Mo, of 286** CRM pulp analyses, 272 are within +/- 2 SD (95%)
- **For Fe, of 2** CRM pulp analyses, All are within +/- 2 SD (100%)
- **228** samples of pulp that are known to have a blank Au value have been included with the samples submitted. 11 samples returned Au values of >5 ppb (up to 9 ppb) indicating only mild instrument calibration or contamination during fire assay.
- **671** ¼ core duplicate samples have been submitted. The duplicate analyses for Au, Ag, Cu, Pb, Zn, As and Mo have been analysed. The duplicate sample analyses follow very closely the original analyses providing assurance that the sample size and technique is appropriate.

**Historic:**

- The nature, quality and appropriateness of the assaying and laboratory procedures used by Newmont and Odin are still in line with industry best practice with appropriate QA/QC and chain of custody and are considered appropriate.
- Available historical data does not mention details of geophysical tools as such it is believed a geophysical campaign was not completed in parallel with the drilling campaign.
- Duplicates were prepared by the Laboratory (Bonder Cleg) which used internal standards. Newmont also inserted its own standards at 25 sample intervals as a control on analytical quality. Later Odin undertook a re-assaying program of the majority of the higher-grade sections which confirmed the repeatability.
- Given the above, it is considered acceptable levels of accuracy and precision have been established
- CEL ¼ and ½ core samples were prepared for assay at SGS Del Ecuador S.A.in Quito, Ecuador with analysis completed by in Lima at SGS del in Peru S.A.C and by ALS Laboratories in Quito with analysis completed by ALS in Vancouver, Canada. Samples were crushed and a 500g sub-sample was pulverized to 85% passing 75 µm. The technique provides for a near total analysis of the economic elements of interest.
- CEL rock chip samples were prepared for assay at ALS Laboratories (Quito) with analysis being completed at ALS Laboratories (Peru). The fire assay and 4-acid digest provide for near-total analysis of the economic elements of interest. No standards or blanks were submitted with the rock chip samples.

Commentary

Colorado V:**CEL: Camp #1, Phase#1**

- All drill core collected by CEL has been crushed to a nominal 2mm size. A 500 g sub-sample has been pulverized to 85% passing 75 micron at the SGS Laboratory in Guayaquil. Sub-samples of the pulps have been analyzed by SGS for Au by Fire Assay (30g) with AAS determination and gravimetric determination where over limit. Sub-samples of the pulps are also assayed for a multi element suite by 4-acid digest with ICPMS determination (including Cu, Mo, Ag, Zn, Pb, S and Fe). All assay techniques are partial assays of the total sample.
- Samples submitted by CEL include standards (CRM), blanks and duplicate samples to provide some control (QAQC) on the accuracy and precision of the analyses.
- 8 different CRM pulp samples have been submitted with the core samples. All 8 are certified for Au, 3 are certified for Ag, 7 are certified for Cu, 1 is certified for Fe and 4 are certified for Mo.
- **For Au, of 352 CRM** pulp analyses, 346 are within +/- 2 SD (98%)
- **For Ag, of 134 CRM** pulp analyses, 127 are within +/- 2 SD (95%)
- **For Cu, of 338 CRM** pulp analyses, 324 are within +/- 2 SD (96%)
- **For Mo, of 197 CRM** pulp analyses, 187 are within +/- 2 SD (95%)
- **For Fe, of 15 CRM** pulp analyses, all are within +/- 2 SD (100%)
- **162** samples of pulp that are known to have a blank Au value have been included with the samples submitted. 24 samples returned Au values of >5 ppb (up to 11 ppb) indicating only mild instrument calibration or contamination during fire assay.
- **474** ¼ core duplicate samples have been submitted. The duplicate analyses for Au, Ag, Cu, Pb, Zn, As and Mo have been analysed. The duplicate sample analyses follow very closely the original analyses providing assurance that the sample size and technique is appropriate.

Historic:

- No information is available on the methods used to analyse the historic soil or drill core samples. Assay results are not provided in this report. Soil samples have been analysed by GK for Au, Cu, Ag, Zn, Pb, As, Mn, Ni, Cr, Mo, Sn, V, Ti, Co, B, Ba, Sb, Bi and Hg. Pulps have been securely retained and check assaying is planned.
- Drill core was partially assayed for gold only with assays undertaken by Goldking’s on site laboratory
- CEL samples of drill core re-sampled by CEL. Blanks and CRM (standards) were added to the batches to check sample preparation and analysis. 3 separate CRM’s were included in the batches sent for analysis. All three have certified Au values. The results of the analysis of the CRM are shown below. With a few exceptions, the CRM has returned results within +/- 2 SD of the certified reference value. There is no bias in the results returned from either SGS or ALS laboratories. CRM3 analyses by fire assay at SGS did not include overlimit (>10 g/t).

- No duplicate samples have been submitted.
- Two different blanks have been included randomly within the sample batches. A CRM blank with a value of <0.01 ppm (10 ppb) Au was used initially. More recent batches have used a blank gravel material which has no certified reference value. The results are shown below. The first 4 gravel blanks show elevated Au values which is believed to be due to contamination of the blank prior to submission and not due to laboratory contamination. With one exception, the blanks have returned values below 10 ppb.

Criteria

JORC Code explanation

Commentary

**Verification of sampling and assaying**

- *The verification of significant intersections by either independent or alternative company personnel.*
- *The use of twinned holes.*
- *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.*
- *Discuss any adjustment to assay data.*

CEL Drilling (El Guayabo and Colorado V):

- Samples from significant intersections have not been checked by a second laboratory. No holes have been twinned.
- Data from logging and assaying is compiled into a database at the Project and is backed up in a secure location. CEL GIS personnel and company geologists check and verify the data. No adjustments are made to any of the assay data.

Historic:**El Guayabo:**

- All intersections with results greater than 0.5 g/t were re-assayed using the “blaster” technique - a screen type fire analysis based on a pulverized sample with a mass of about 5 kg. Additionally, Odin re-assayed the many of the higher-grade sections with re-assay results demonstrating repeatability of the original results.
- Neither Newmont nor Odin attempted to verify intercepts with twinned holes
- Data was sourced from scanned copies of original drill logs and in some cases original paper copies of assay sheets are available. This data is currently stored in a drop box data base with the originals held on site.
- No adjustments to assay data were made.
- CEL assay data has not been independently verified or audited. Data is stored electronically in MS Excel and PDF format from the Laboratory and entered into a Project database for analysis. There has been no adjustment of the data.

Section 2: Reporting of Exploration Results -El Guayabo Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	<ul style="list-style-type: none"> - <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> - <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<ul style="list-style-type: none"> - The El Guayabo (Code. 225) mining concession is located within El Oro Province. The concession is held by Torata Mining Resources S.A (TMR S.A) and was granted in compliance with the Mining Act (“MA”) in on April 27, 2010. There are no overriding royalties on the project other than normal Ecuadorian government royalties. - The property has no historical sites, wilderness or national park issues. - The mining title grants the owner an exclusive right to perform mining activities, including, exploration, exploitation and processing of minerals over the area covered by the prior title for a period of 25 years, renewable for a further 25 years. Under its option agreement, the owner has been granted a negative pledge (which is broadly equivalent to a fixed and floating charge) over the concession. In addition, a duly notarized Irrevocable Promise to Transfer executed by TMR S.A in favor of AEP has been lodged with the Ecuador Mines Department. - The Colorado V mining concession (Code No. 3363.1) located in Bellamaria, Santa Rosa, El Oro, Ecuador was granted in compliance with the Mining Act (“MA”) in on July 17, 2001. It is adjacent to El Guayabo concession to the north. The concession is held by Goldking Mining Company S.A. There are no overriding royalties on the project other than normal Ecuadorian government royalties. - The concession has no historical sites, wilderness or national park issues. - The El Guayabo 2 (Code. 300964) mining concession is located Torata parish, Santa Rosa canton, El Oro province, Ecuador. The concession is held by T Mr. Segundo Ángel Marín Gómez and Mrs. Hermida Adelina Freire Jaramillo and was granted in compliance with the Mining Act (“MA”) on 29April 29, 2010. There are no overriding royalties on the project other than normal Ecuadorian government royalties. - The property has no historical sites, wilderness, or national park issues.
Exploration done by other parties	<ul style="list-style-type: none"> - <i>Acknowledgment and appraisal of exploration by other parties.</i> 	<p>El Guayabo:</p> <ul style="list-style-type: none"> - Previous exploration on the project has been undertaken by Newmont and Odin from 1994 to 1997. This included surface pit and rock chip geochemistry, followed by the drilling of 33 drill holes for a total of 7605.52 meters) to evaluate the larger geochemical anomalies. - The collection of all exploration data by Newmont and Odin was of a high standard and had appropriate sampling techniques and intervals, adequate QA/QC and custody procedures, and appropriate duplicates and blanks used for determining assay precision and accuracy. - The geological interpretation of this data, including core logging and follow up geology was designed and directed by in-country inexperienced geologists. It appears to have been focused almost exclusively for gold targeting surface gold anomalies or the depth extensions of higher-grade gold zones being exploited by the artisanal miners. The geologic logs for all drill holes did not record details that would have been typical, industry standards for porphyry copper

Data aggregation methods	<ul style="list-style-type: none"> - In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<ul style="list-style-type: none"> • No grade cutting has been used to derive the weighted average grades reported. • Minimum cut of grade of 0.2 g/t Au Equivalent (AuEq) was used for determining intercepts. • Aggregate intercepts have been reported with higher grade inclusions to demonstrate the impact of aggregation. A bottom cut of 0.5 g/t Au Equivalent has been used to determine the higher-grade inclusions. Given the generally consistent nature of the mineralisation the impact of the aggregation of high-grade results and longer lengths of low-grade results does not have a large impact. For example, in the intercept of 156m @ 2.6 g.t Au in hole GGY-02: <ul style="list-style-type: none"> • over half of the intercept comprises gold grades in excess of 1 g/t Au • only 20% of the intercept includes grades between 0.2 and 0.5 g/t Au • over one third includes gold grades in excess of 2 g/t Au. • Au Eq assumes a gold price of USD 1,780/oz, a silver price of USD 22 /oz, a copper price of USD 9,650 /t, and a Molybdenum price of US\$40,500/t • Metallurgical recovery factors for gold, silver, copper, and Molybdenum are assumed to be equal. No metallurgical factors have been applied in calculating the AuEq at this early stage of the Project, hence the formula for calculating the Au Eq is: Au (g/t) + (Ag (g/t) x 22/1780) + (1.68604 x Cu (%)) + (7.07612 x Mo (%)). • CEL confirms that it is the company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold <p>Guayabo: A cut-off grade of 0.1 g/t Au was used to report the assays of re-samples core and channel samples from underground development with up to 10 metres of internal dilution below cut-off allowable for the reporting of significant intercepts, consistent with a large low-grade mineralized system. Intersections that use a different cut-off are indicated.</p> <p>Significant Historic intersections from El Guayabo drilling are shown below:</p>

Colorado V:

A cut-off grade of 0.1 g/t Au was used to report the assays of re-samples core and channel samples from underground development with up to 10 metres of internal dilution below cut-off allowable for the reporting of significant intercepts, consistent with a large low-grade mineralized system. Intersections that use a different cut-off are indicated.

Relationship between mineralisation - *These relationships are particularly important in* - The geometry of the breccia hosted mineralisation appears to be predominantly near-vertical pipes while the geometry of the intrusive hosted mineralisation is sub-vertical.

widths and intercept lengths

the reporting of Exploration Results.

- *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.*
- *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*

- The preliminary interpretation is that the breccia hosted mineralisation occurs in near vertical breccia pipes. Thus, intersections in steeply inclined holes may not be representative of the true width of this breccia hosted mineralisation. The relationship between the drilling orientation and some of the key mineralised structures and possible reporting bias in terms of true width is illustrated in the figure below.

Diagrams

- *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and*

Criteria	JORC Code explanation	Commentary
	<i>appropriate sectional views.</i>	
Balanced reporting	- <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i>	- The reporting is fair and representative of what is currently understood to be the geology and controls on mineralisation at the project.
Other substantive exploration data	- <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i>	<p>El Guayabo: Quantec Geophysical services conducted a SPARTAN Broadband Magnetotelluric and TITAN IP/EMAP surveys completed February 3rd to April 1st, 2019 over the El Guayabo property by Quantec Geoscience Ltd. on behalf of AAR Resources. The survey covered 16 square kilometers with data collected on 300m 3D spacing on a grid oriented at 10 degrees and 100 degrees. The grid was moved 10 degrees so the survey could be oriented perpendicular to the main geological structures. The survey involved a total of 205 Magnetotelluric (MT) sites and 2 test TITAN IP/EMAP profiles were surveyed. The final survey results to which will be delivered will consist of :</p> <ul style="list-style-type: none"> • Inversion 2D products <ul style="list-style-type: none"> • 2D model sections (for each line) of the: • DC resistivity model; • IP chargeability model using the DC resistivity model as a reference; • IP chargeability model using a half-space resistivity model as a reference; • MT(EMAP) resistivity model; • Joint MT+DC resistivity model; IP chargeability model using the MT+DC resistivity model; • Inversion 3D products <ul style="list-style-type: none"> • 3D MT model; <ul style="list-style-type: none"> • Cross-sections and Elevation Plan maps of the 3D MT models; <p>Figures showing Survey Locations and Results are included in the body of this release</p> <p>DCIP INVERSION PROCEDURES DCIP is an electrical method that uses the injection of current and the measurement of voltage difference along with its rate of decay to determine subsurface resistivity and chargeability respectively. Depth of investigation is mainly controlled by the array geometry but may also be limited by the received signal (dependent on transmitted current) and ground resistivity. Chargeability is particularly susceptible to data with a low signal-to-noise ratio. The differences in penetration depth between DC resistivity and chargeability are a function of relative property contrasts and relative signal-to-noise levels between the two measurements. A detailed introduction to DCIP is given in Telford, et al. (1976). The primary tool for evaluating data is</p>

Commentary

through the inversion of the data in two or three dimensions. An inversion model depends not only on the data collected, but also on the associated data errors in the reading and the “model norm”. Inversion models are not unique and may contain “artefacts” from the inversion process. The inversion model may not accurately reflect all the information apparent in the actual data. Inversion models must be reviewed in context with the observed data, model fit, and with an understanding of the model norm used.

The DC and IP inversions use the same mesh. The horizontal mesh is set as 2 cells between electrodes. The vertical mesh is designed with a cell thickness starting from 20 m for the first hundred metres to accommodate the topographic variation along the profiles, and then increases logarithmically with depth. The inversions were generally run for a maximum of 50 iterations. The DC data is inverted using an unconstrained 2D inversion with a homogenous half-space of average input data as starting model. For IP inversions, the apparent chargeability ρ is computed by carrying out two DC resistivity forward models with conductivity distributions $\sigma(x_i, z_j)$ and $(1-\eta)\sigma(x_i, z_j)$ (Oldenburg and Li, 1994), where (x_i, z_j) specifies the location in a 2D mesh. The conductivity distributions used in IP inversions can be the inverted DC model or a half space of uniform conductivity. Two IP inversions are then calculated from the same data set and parameters using different reference models. The first inversion of the IP data uses the previously calculated DC model as the reference model and is labelled the IP dcref model. The second IP inversion uses a homogeneous half-space resistivity model as the reference model and is labelled IP horef model. This model is included to test the validity of chargeability anomalies, and to limit the possibility of inversion artefacts in the IP model due to the use of the DC model as a reference. The results of this second IP inversion are presented on the digital archived attached to this report.

MAGNETOTELLURIC INVERSIONS

The Magnetotelluric (MT) method is a natural source EM method that measures the variation of both the electric (E) and magnetic (H) field on the surface of the earth to determine the distribution at depth of the resistivity of the underlying rocks. A complete review of the method is presented in Vozoff (1972) and Orange (1989).

The measured MT impedance Z, defined by the ratio between the E and H fields, is a tensor of complex numbers. This tensor is generally represented by an apparent resistivity (a parameter proportional to the modulus of Z) and a phase (argument of Z). The variation of those parameters with frequency relates the variations of the resistivity with depth, the high frequencies sampling the sub-surface and the low frequencies the deeper part of the earth. However, the apparent resistivity and the phase have an opposite behaviour. An increase of the phase indicates a more conductive zone than the host rocks and is associated with a decrease in apparent resistivity. The objective of the inversion of MT data is to compute a distribution of the resistivity of the surface that explains the variations of the MT parameters, i.e. the response of the model that fits the observed data. The solution however is not unique and different inversions must be performed (different programs, different conditions) to test and compare solutions for artefacts versus a target anomaly.

An additional parameter acquired during MT survey is the Tipper. Tipper parameters Tzx and Tzy (complex numbers) represent the transfer function between the vertical magnetic field and the horizontal X (Tzx), and Y (Tzy) magnetic fields respectively (as the impedance Z represent the transfer function between the electric and magnetic fields). This tipper is a ‘local’ effect, mainly defined by the lateral contrast of the resistivity. Consequently, the tipper can be used to estimate the geological strike direction. Another important use of the tipper is to display its components as vectors, named induction

Commentary

vectors. The induction vectors (defined by the real components of Tzx and Tzy) plotted following the Parkinson-Real-Reverse-Angle convention will point to conductive zones. The tipper is then a good mapping tool to delineate more conductive zones. The depth of investigation is determined primarily by the frequency content of the measurement. Depth estimates from any individual sounding may easily exceed 20 km. However, the data can only be confidently interpreted when the aperture of the array is comparable to the depth of investigation.

The inversion model is dependent on the data, but also on the associated data errors and the model norm. The inversion models are not unique, may contain artefacts of the inversion process and may not therefore accurately reflect all the information apparent in the actual data. Inversion models need to be reviewed in context with the observed data, model fit. The user must understand the model norm used and evaluate whether the model is geologically plausible.

For this project, 2D inversions were performed on the TITAN/EMAP profiles data. For each profile, we assume the strike direction is perpendicular to the profile for all sites: the TM mode is then defined by the inline E-field (and cross line H-field); no TE mode (cross line E-field) were used in the 2D inversions.

The 2D inversions were performed using the TM-mode resistivity and phase data interpolated at 6 frequencies per decade, assuming 10% and 5% error for the resistivity and phase respectively, which is equivalent to 5% error on the impedance component Z. No static shift of the data has been applied on the data.

The 3D inversion was carried out using the CGG RLM-3D inversion code. The 3D inversions of the MT data were completed over an area of approximately 5km x 3.5km. All MT sites from this current survey were used for the 3D inversion.

The 3D inversion was completed using a sub sample of the MT data with a maximum of 24 frequencies at each site covering the measured data from 10 kHz to 0.01 Hz with a nominal 4 frequencies per decade. At each site, the complete MT complex impedance tensors (Zxx, Zxy, Zyx, and Zyy) were used as input data with an associated error set to 5% on each parameter. The measured tipper data (Tzx, Tzy) were also used as input data with an associated error set to 0.02 on each parameter. A homogenous half space with resistivity of 100 Ohm-m was used as the starting model for this 3D MT inversion. A uniform mesh with 75 m x 75 m cell size was used in horizontal directions in the resistivity model. The vertical mesh was defined to cover the first 4 km. Padding cells were added in each direction to accommodate the inversion for boundary conditions. The 3D inversion was run for a maximum of 50 iterations.

In addition a total of 129 samples distributed along 12 holes were analysed to measure the resistivity (Rho (Ohm*m) and chargeability properties (Chargeability M and Susceptibility (SCPT 0.001 SI) . The equipment used for the analyses was the Sample Core IP Tester, manufactured by Instrumentation GDD Inc. It should be noted that these measures should be taken only as first order estimate, and not as "absolute" (true) value as readings by the field crew were not repeated and potentially subject to some errors (i.e. wrong size of the core entered in the equipment).

Colorado V:

Exploration Target:

An Exploration Target for two mineralized zones on the Colorado V mining concession has been made using surface gold in soil anomalies, drill hole geological and assay information and panel sampling from an adit at one of the targets.

		The potential quantity and grade of the Colorado V Exploration Target is conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource and that it is uncertain if further exploration will result in the estimation of a Mineral Resource.			
		The following is an explanation of the inputs used in formulating the Exploration Target.			
		<ul style="list-style-type: none"> Surface Area: The surface area of the target has been estimated by projecting drill hole gold significant intersections vertically to the surface. The surface projection of the intersections in the drill holes coincides with the 100 ppb Au gold-in-soil anomaly contour. This area has been used to estimate the horizontal extent of the mineralization. Depth: A depth of 400 metres from surface has been used as an estimate of the depth that an open pit and underground bulk tonnage mining project would be expected to extend. The mineralization at Colorado V is controlled by steeply plunging / dipping intrusions and breccia which is expected to extend to at least 400m depth

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	<ul style="list-style-type: none"> - Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection and its use for Mineral Resource estimation purposes. - Data validation procedures used. 	<p>The database includes both drilling completed by previous explorers, drill holes recently completed by the Company and underground channel samples completed by the Company.</p> <p>Drill core from historic drilling has been recently re-logged and re-sampled. These data are transcribed by the database / GIS team into a database held on site at EMSA offices in Totara, Ecuador. Only the drill hole collar and down-hole survey from the historic data has been directly transcribed from the historic data. All other data is newly generated.</p> <p>Logging data from channel samples and drill holes completed by the Company (Phase 1 and Phase 2) are transcribed into the same database as the historic data. Drill hole collar, survey, logging is captured directly into MS Excel and peer reviewed before being given to the database team. Final assay data received from the labs is reviewed (blanks, duplicates and standards) and then added to the database. Backup copies of all data are retained in separate files.</p> <p>The drill hole data is backed up and is updated periodically.</p>
Site visits	<ul style="list-style-type: none"> - Comment on any site visits undertaken by the Competent Person and the outcome of those visits. - If no site visits have been undertaken indicate why this is the case. 	<p>CEL representatives have visited from 2019, during early-stage exploration and drilling. Early site visits were undertaken to review the progress of exploration prior to drilling and to review historic drill core. The most recent site visit was in June 2022 to review the geology, drilling program, collection of data, sampling procedures, sample submission and exploration program. Competent Persons that completed the NI-43-101 report for presentation to the TSX completed site visits in early 2024 in preparation for completing that report and undertaking the Foreign Resource Estimate according to Canadian NI43-101 reporting standards.</p>
Geological interpretation	<ul style="list-style-type: none"> - Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit. - Nature of the data used and of any assumptions made. - The effect if any of alternative interpretations on Mineral Resource estimation. - The use of geology in guiding and controlling Mineral Resource estimation. - The factors affecting continuity both of grade and geology. 	<p>The geological interpretation and understanding of the controls on mineralisation has been used to model the geometry of the mineralised system. El Guayabo is a high-level porphyry intrusive and intrusive-related breccia complex with mineralisation controlled by regional scale and local scale fault-fracture zones and lithology contacts. Multiple pulses of mineralisation are evident in the alteration and vein overprinting relationships.</p> <p>Given the available data and understanding of the geological controls on mineralisation, the Competent Person has confidence in the geological model that has been used to constrain the high grade and low grade mineralised domains.</p> <p>At the El Guayabo deposits, continuity of grade between drill holes is determined by the</p>

Criteria	JORC Code explanation	Commentary
		The Foreign Resource Estimate is reported to a cut-off grade of 0.30 ppm AuEq. Under this scenario, blocks with a grade above the 0.30 g/t Au Eq cut off are considered to have reasonable prospects of mining by open pit methods.
Mining factors or assumptions	- Assumptions made regarding possible mining methods minimum mining dimensions and internal (or if applicable external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the mining assumptions made.	The Foreign Resource Estimate has assumed that near surface mineralisation would be amenable to open pit mining given that the mineralisation is exposed at surface. No assumptions have been made regarding mining widths or dilution.
Metallurgical factors or assumptions	- The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.	No metallurgical test work has been completed on the El Guayabo mineralisation. The Foreign Mineral Resource assumes all metals will have equivalent recoveries.
Environmental factors or assumptions	- Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.	It is considered that there are no significant environmental factors which would prevent mining. Mining is assumed to be crush, grind and sequential flotation with appropriate waste dump and tailings disposal. No detailed environmental impact studies have been completed.
Bulk density	- Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and	The Company has collected 379 specific gravity (SG) measurements from drill core, which have been used to estimate block densities for the Resource Estimate. Measurements we determined on a dry basis by measuring the difference in sample weight in

	<p><i>operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i></p>	
Bulk density	<ul style="list-style-type: none"> - <i>Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples.</i> - <i>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit.</i> - <i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i> 	<p>The Company has collected 379 specific gravity (SG) measurements from drill core, which have been used to estimate block densities for the Resource Estimate. Measurements were determined on a dry basis by measuring the difference in sample weight in water and weight in air.</p> <p>The SG values across the different rock types and mineralisation styles are stable and so an average SG was applied for the whole block model to estimate the density. Of the SG values measured the range is 1.83 to 3.63 g/cc. The average value is 2.74 g/cc and the median value is 2.73 g/cc.</p> <p>A bulk density value of 2.73 g/cc (2,730 kg/m³) was applied to the blocks to estimate tonnage.</p>
Classification	<ul style="list-style-type: none"> - <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i> - <i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity and distribution of the data).</i> - <i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i> 	<p>The Mineral Resource has been classified based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters and an analysis of available density information.</p> <p>The estimation search strategy was undertaken in one pass with classification of the resource into Inferred.</p> <p>The potential open pit resource was constrained within an optimised pit shell run using a gold price of \$1,800 per ounce. Blocks inside the pit shell were reported above a AuEq cut-off grade of 0.30 ppm and blocks outside the pit shell were reported above a AuEq cut-off grade of 0.40 ppm. The Resource Estimate is classified 100% Inferred.</p> <p>The Competent Person has reviewed the result and determined that these classifications are appropriate given the drill hole spacing, domain constraints and confidence in the geology, data and results from drilling.</p>
Audits or reviews	<ul style="list-style-type: none"> - <i>The results of any audits or reviews of Mineral Resource estimates.</i> 	<p>The Mineral Resource estimate has not been independently audited or reviewed.</p>

Criteria	JORC Code explanation	Commentary
	<i>metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.</i>	Colorado V. Gold – 85% (Lumina Gold PFS) Copper – 85% (PFS recovery is 79% but this is based on a mix of fresh (87%) and part oxidised (50%) whereas there is minimal oxidised material at Colorado V - Lumina 43-101 report June 2022) Silver – 60% (PFS recovery is 55% but this is based on a mix of fresh (60%) and part oxidised (50%) whereas there is minimal oxidised material at Colorado V) - Lumina 43-101 report June 2022) Molybdenum – 50% (Lumina 43-101 report June 2022)
Environmental factors or assumptions	- <i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i>	It is considered that there are no significant environmental factors which would prevent mining. Mining is assumed to be crush, grind, gravity and sequential flotation with appropriate waste dump and tailings disposal. No detailed environmental impact studies have been completed.
Bulk density	<ul style="list-style-type: none"> - <i>Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples.</i> - <i>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit.</i> - <i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i> 	<p>The Company has collected 410 specific gravity (SG) measurements from drill core, which have been used to estimate block densities for the Resource Estimate. Measurements we determined on a dry basis by measuring the difference in sample weight in water and weight in air.</p> <p>The SG values across the different rock types and mineralisation styles are stable and so an average SG was applied for the whole block model to estimate the density. The average and the median value is 2.73 g/cc. A bulk density value of 2.73 g/cc (2,730 kg/m3) was applied to the blocks to estimate tonnage.</p>
Classification	<ul style="list-style-type: none"> - <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i> - <i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity</i> 	<p>The Mineral Resource has been classified based on the guidelines specified in the JORC Code as Indicated and Inferred based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters.</p> <p>The Colorado V deposit was sampled by drilling at nominal 100m spacing along strike. The central part of the northern domain has been infilled providing the confidence to upgrade this area to Indicated</p>
