

Highlights

- Mineral Resource Estimate ('MRE') at Challenger Gold's Ecuador projects increased from 4.5 to 9.1 Moz¹ AuEq² a 100% growth milestone (Refer Table 1).
- Attributable resource to CEL 6.9 Moz AuEq² across El Guayabo (100%) and Colorado V (50%).
- Significant upside remains: The resource is based on drilling 5 of the 15 major anomalies, with all 13 anomalies drilled returning mineralisation.
- Completion of exploration in Ecuador enables the Company to commence the value realisation process, including strategic divestment options.
 - ¹ Reported on total project basis attributable resource to CEL of 6.9Moz AuEq
 - ² Reported as Gold Equivalent (AuEq) values for requirements under the JORC Code see page 5
 - 3 Refer Table 7 for Hualilan Gold Project MRE and gold equivalent requirements under the JORC Code

Commercial Advantages of the Project

1. Large-Scale Opportunity:

The updated MRE positions Challenger Gold's Ecuador assets among the largest undeveloped gold resources in South America, with **567Mt @ 0.50g/t AuEq for 9.1Moz AuEq** on a total project basis.

2. Premium High-Grade Core Enhances Economics:

The resource includes a **higher-grade core of 2.1 Moz @ 1.0g/t AuEq**, including **1.2 Moz @ 1.2g/t AuEq**, offering potential for early-stage production and strong cash flow generation.

3. Strategic Location Validates District Potential:

The projects are adjacent to Lumina Gold's **20.5Moz Cangrejos project**⁴, which recently secured a **\$300M financing deal with Wheaton Precious Metals**, confirming the district's world-class potential as a globally significant gold-copper region.

⁴ Source: Lumina Gold NI 43-101 PFS Report Cangrejos Project April 2023

4. Development-Ready Infrastructure:

Located just **35km from a deepwater port** with existing power, water, and road access on granted Mining Leases, the project benefits from reduced development costs and logistical efficiencies.

Value Realisation Strategy for Ecuador

Challenger Gold Limited plans to unlock the value of its Ecuador assets through several strategic options:

- TSX Listing: Spin off the Ecuador projects into a standalone entity listed on the TSX, where similar projects trade at premium valuations compared to ASX-listed peers.
- Strategic Sale: Divest the assets outright which could generate immediate capital for advancing Challenger's flagship Hualilan Gold Project in Argentina.
- Farm-In Partnership: Partner with a major mining company to fund development while retaining exposure through royalties or equity participation.

Focus on the Hualilan Gold project

The upgraded MRE concludes Challenger Gold Limited's exploration program in Ecuador, enabling the Company to focus entirely on advancing its flagship Hualilan Gold Project in Argentina, which features:

- A total resource of 2.8Moz AuEq¹, including a high-grade core of 1.5 Moz @ 5.6g/t AuEq¹
- Mineralisation which remains open in all directions
- A toll milling Agreement to capitalise on the current high gold price (above US\$3,000/oz) to generate early cash flow
- This cashflow will be allocated towards the construction of the standalone Hualilan Gold project
- Positioning Hualian as one of South America's premier near-term production opportunities

Monetisation of the Ecuador assets will ensure shareholders benefit directly from both value realisation in Ecuador and production growth at Hualilan.

¹ Refer Table 7 for Hualilan Gold Project MRE and gold equivalent requirements under the JORC Code

Commenting on the resource, CEL Managing Director, Mr Kris Knauer, said

"I would like to congratulate our exploration team in Ecuador for their outstanding work in doubling project resources from 4.5Moz to 9.1Moz AuEq, including a high-grade core of 2.1Moz at 1.0g/t AuEq.

This resource update represents a transformational milestone for Challenger Gold shareholders, enabling us to move forward with unlocking significant value from our Ecuador assets while focusing entirely on bringing our flagship Hualilan project into production.

This is only the beginning for the asset – the current resource is based on drilling just five of fifteen major anomalies identified across our Ecuador projects, with all thirteen anomalies drilled so far returning significant mineralisation."

Mr Pini Althaus , Non Exec Director Mr Brett Hackett Non Exec Director Contact

Challenger Gold Limited (ASX: CEL) ("CEL" or the "Company") is pleased to announce the Mineral Resource Estimate ("MRE") at CEL's Ecuador projects has increased from 4.5 to 9.1 million ounces gold equivalent¹. The combined 9.1 Moz MRE at El Guayabo (CEL 100%) and Colorado V (CEL 50%) comprises 570.3 mt at 0.50 g/t AuEq (0.36 g/t Au, 2.2 g/t Ag, 0.07% Cu, 9.7 ppm Mo) for 9.1 Moz AuEq. This 9.1 Moz MRE includes;

- a total maiden MRE of **4.4 million ounces gold equivalent**¹ at a grade of **0.50 g.t AuEq**^{1,2} (0.35 g/t Au, 2.2 g/t Ag, 0.08% Cu,14.3 ppm Mo) for the Colorado V Project (CEL 50%); and an
- updated MRE of 4.7 million ounces gold equivalent¹ at 0.50 g/t AuEq¹ (0.38 g/t Au, 2.3 g/t Ag, 0.06% Cu,7.5 ppm Mo) at the adjoining 100% owned El Guayabo Project.

The Company has now earned an initial 50% interest in the Colorado V Project. Net attributable resources to CEL across both projects are 6.9 Moz AuEq¹ - 431 mt at 0.50 g/t AuEq^{1,2} (0.37 g/t Au, 2.3 g/t Ag, 0.07% Cu, 10 ppm Mo).

The 9.1 Moz MRE is based on drilling five of the fifteen regionally significant Au-Cu soil anomalies identified across the project (Figure 1). All 13 Au-Cu soil anomalies drilled to date have returned significant mineralisation.

At Colorado V, the maiden MRE is based on drilling over the CV-A anomaly and the southern portion of CV-B. Mineralisation remains open in both directions along strike and at depth at both CV-A and CV-B. Results on the northern half of the CV-B anomaly include **504.3m at 0.3 g/t AuEq** including **276.1m at 0.4 g/t AuEq and 116.1m at 0.5 g/t AuEq** however, the drill density was insufficient to allow the reporting of an MRE in accordance with the JORC Code in the northern half of CV-B.

The updated El Guayabo resource included four additional drillholes for 2594 metres and an additional 3058 metres of underground and surface channel sampling that was completed after the previous MRE cut-off date. The El Guayabo MRE includes the GY-A, GY-B, and GY-C anomalies on the Company's 100% owned El Guayabo concession.

Mineralisation remains open in both directions along strike and at depth on all five anomalies where drilling has been of sufficient density to allow the reporting of an MRE. There is clear potential for significant growth in the MRE, not only via additional drilling on these five anomalies, but also across the remaining 10 mineralised anomalies that have yet to be tested by resource drilling.

Table 1 shows the classification of the MRE and the breakdown between the in-pit and underground component of the 9.1Moz MRE. There is a discrete higher-grade component to the resource. This higher-grade component of the MRE comprises (see Table 2 Grade Tonnage data):

2.1 Moz at 1.0 g/t AuEq^{1,2} - 65.7 Mt at 0.8 g/t Au, 3.4 g/t Ag, 0.11% Cu, 9.4ppm Mo (0.70 g/t AuEq cut-off)
1.2 Moz at 1.2 g/t AuEq^{1,2} - 31.7 Mt at 1.0 g/t Au, 4.1 g/t Ag, 0.13% Cu, 7.3ppm Mo (0.85 g/t AuEq cut-off)
0.8 Moz at 1.4 g/t AuEq^{1,2} - 17.7 Mt at 1.1 g/t Au, 4.8 g/t Ag, 0.17% Cu, 6.9ppm Mo (1.0 g/t AuEq cut-off)

Table 1 Combined El Guayabo and Colorado V MRE

¹ Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1800 Oz, Ag US\$22 Oz, Cu US\$9,000/t, Mo US\$44,080/t
- Metallurgical recoveries are estimated to be Au (85%), Ag (60%), Cu (85%) Mo (50%) across all ore types (see JORC Table 1 Section 3 Metallurgical assumptions) based on metallurgical test work.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times 0.012222] + [Cu (%) \times 1.555] + [Mo (%) \times 4.480026]$
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

EL GUAYABO AND COLORADO V PROJECT GEOLOGY

The El Guayabo Project comprises 3609 Ha (36.1 km²) of Exploitation (mining) Licenses valid until 2028 with an automatic 20-year renewal. These mining licenses are held via a combination of outright ownership, farmin agreements and options to acquire as outlined below. The current 9.1 Moz Gold Equivalent is located almost across the Company's 100% owned El Guayabo concession, the Cerro Pelado concession where CEL has the option to acquire 100%, and the Colorado V concession where CEL has earned an initial 50% interest in the MRE.

- El Guayabo concession (257 Ha) 100% owned
- Cerro Pelado concessions (61 Ha) option to acquire 100%
- El Guayabo 2 concession (957 Ha) earning 80% with option to move to 100%
- Colorado V concession (2331 Ha) earned an initial 50% interest

Mr Pini Althaus , Non Exec Director Mr Brett Hackett Non Exec Director Contact

The completion of the maiden MRE at Colorado V completes CEL's requirements under the farmin to earn a 50% Interest in the MRE. CEL and the current owner will then jointly fund a Definitive Feasibility Study and ongoing development.

Location and Logistics

Colorado V and El Guayabo are located within the El Oro Province of southern Ecuador, 35 Kilometers southeast of the port city of Machala, Ecuador's fourth largest city and the capital of El Oro Province. Machala city lies on the Pan-American Highway linking Guayaquil to Lima in Peru. The port of Puerto Bolivar, a deepwater commercial port, is located 9 km to the west of Machala. The projects are coastal at an elevation of less than 1000 metres and are covered by a mix of pasture with some secondary regrowth forest. Exploration conditions are excellent with field exploration possible all year round as is exploration drilling 24 hours a day. The projects have power, water and internet coverage to site.

The projects adjoin the 20.5-million-ounce Cangrejos Gold Project⁴ owned by Lumina Gold (TSX: LUM). Cangrejos, El Guayabo, and Colorado V have the same geology, surface footprint, and mineralisation style, and are interpreted as being part of the same system. Lumina Gold has released the results of a Pre-Feasibility Study for Cangrejos. Additionally, in May 2024 Lumina announced it had entered into an agreement with Wheaton Precious Metals for Wheaton to provide Lumina US\$300M financing via a Gold Stream for Cangrejos.

Geology of El Guayabo and Colorado V Projects

The project geology comprises a metamorphic basement (El Oro Metamorphic Complex) of Cretaceous age intruded by nested intermediate alkaline intrusives which are Tertiary in age from 40 – 10 Ma (million years). The nested intrusions are commonly intruded by later mineralized intrusions, porphyry dykes and intrusive breccias of late Oligocene to Miocene age, suggesting deeper, evolving magmatic systems are feeding shallower systems.

The Project contains a "Low Sulphide" porphyry gold copper system. The Au-Ag-Cu-Mo mineralisation in the El Guayabo concession is associated with mineralized diorite intrusions exhibiting local porphyry stock work veining and associated intrusive breccias that are structurally controlled on a dominant NE/SW trend and many times on the intersection of NW/SE secondary trend.

The Colorado V concession which is approximately 750 metres deeper in the system (Figure 4) is a high-level porphyry intrusive and intrusive-related breccia complex with mineralisation controlled by regional scale and local scale fault-fracture zones, breccia zones and lithology contacts.

Soil geochemistry conducted by the Company produced 15 regionally significant Au-Cu soil anomalies across the Colorado V and El Guayabo concessions. Exploration drilling on 13 of the soil anomalies has been completed with all holes intersecting mineralisation (Figure 1).

RESOURCE MODEL AND MINERAL RESOURCE ESTIMATE

Pit Optimisation Parameters

A 0.30 g/t AuEq lower cut-off grade inside an US\$2000 oz Au optimised pit shell has been used to report that part of both the Colorado-V and updated El Guayabo MRE that has reasonable prospects of future economic extraction via surface mining. The pit optimisation parameters are outlined in Table 3 (over the page). They reflect internally researched costs and assumptions for similar style projects in Ecuador and are reasonable for the prospect of eventual extraction.

Pit slopes of 47.5° were used in the surface optimisation. Detailed geotechnical work has yet to be completed, however the Company notes this is the Pit slope to be employed at Cangrejos which is interpreted as part of the same mineralised system as the El Guayabo and Colorado V Projects.

The average metallurgical recoveries used for gold (85%), silver (60%), copper (85%), and molybdenum (50%) were derived by benchmarking nearby deposits in Ecuador most notably the Cangrejos Project. Concentrate payability was taken from ongoing discussions the Company has had with concentrate off-takers including smelters and trades. The gold equivalents reflect the updated metal recoveries.

Mr Brett Hackett Non Exec Director

Resources below the optimised surface shell have been reported as an Inferred Resource at a 0.4 g/t AuEq cut-off. Based on the grade, distribution, orientation, and dimensions of the underground mineralisation this is considered to have reasonable prospects of future economic extraction via bulk underground mining methods.

Metal Prices	Value
Au price	US\$2000 oz

Table 3 - Pit Optimisation Parameters

COLORADO V MAIDEN MINRAL RESOURCE ESTIMATE

The Colorado V MRE has been generated from CEL diamond drill holes, results from an underground channel sampling campaign completed by CEL and historic drill holes results that have been validated and verified by CEL with core re-sampling and re-assay. Halved drill core is sampled over intervals from 0.5 to 2.0 metres according to lithology and alteration contacts. Data used is shown in Table 4.

Mr Brett Hackett Non Exec Director

Directors

The Colorado-V rock-saw sampling is done using a rock saw to cut and recover a continuous channel measuring approximately 4cm x 4cm along any outcrop. The 4cm x 4cm sample weight averages 4.8 kg per metre, approximately the same as the NQ sized drill core in the El Guayabo Project drill program. The samples are logged and submitted for assay with QAQC samples (duplicates, blanks and standards) using the same procedure as drill core. It is expected that the data can be incorporated into a resource estimation in the same way as drilling results.

Company	Sample Type	Status	Num. Holes	Metres Drilled
Gold King	Diamond core	Historic	44	14,186
Gold King	Diamond core	Historic with re-assays	26	11,151
CEL	Diamond core	Executed	25	17,237
CEL	Diamond core	Executed GK	4	2,090
CEL	Channel	Executed	27	928
			126	45,592

Table 4 - Data used in maiden Colorado V MRE

Domains

Two separate mineralised domains were wireframed using drill hole data loaded in Micromine Origin and Leapfrog.

- 1. A NE striking (025°) domain that encompasses the CV-A and CV-B surface geochemical anomalies. Geological mapping (surface and underground) and drill core geological logging indicates a steeply north-west dipping (85°), north-east striking control on mineralisation. The wireframe for this domain was built in Leapfrog using a 0.2 AuEq isosurface to limit the extent of blocks that can be included in the resource
- 2. A SE striking (120°), steeply NE dipping domain that terminates the SW end of the NE striking domain. This domain includes the Humedo adit and associated workings. Within this domain, a steeply plunging mineralised shoot (75° to the south-east) is developed. The wireframe for this domain was built using the RBF tool in Micromine using a 0.2 AuEq isosurface to limit the extent of blocks that can be included in the resource.

Each broad domain was constrained by interpreted geological continuity with mineralisation > 0.2 g/t AuEq and a 200 metre range to limit the extent of the mineralisation in each domain. A 2 metre composite length was selected after reviewing the composite statistics.

Top Cutting

Domain top cuts were applied to the 2 domains for each element in order to reduce the influence of extreme values on the MRE without downgrading the high-grade composites too severely.

The top-cut values were chosen by assessing the high-end (tail) of the grade population within each group and where necessary, selecting the uppermost outlier value above which the distribution became too heavily skewed. The top cuts applied in each of the four domains are shown in Table 5.

Domain	Au Top-cut (g/t)	Ag Top-cut (g/t)	Cu Top-cut (%)	Mo Top-cu (ppm)t
100	3	n/a	n/a	150
200	5	20	n/a	30

Table 5 - Top cuts Applied to each Domain (n/a; no top cut applied)

Block Model and Estimation

A block model was set up in SurpacTM V6.6 software with a cell size of 20m (E) x 20m (N) x 20m (RL) for both domains. Variography was carried out using Leapfrog Edge software on the composited data from each of the two domains for each variable. Variograms were modelled in three directions for each domain and each element as well as a downhole direction.

Assumed density is 2.73 g/cm³ (2.730 g/cc) which is the median SG value of 410 representative samples of core that were made during the core logging process. The SG values measured had a tight range which was independent of lithology and assay values.

No previous JORC Resource estimates or non-JORC Foreign Resource estimates were made with similar methods to compare to the current MRE. No production records are available to provide comparisons.

Within each domain, estimation was made for Au Ag, Cu and Mo being the elements of economic interest. All of the relevant variables; Au, Ag, Cu and Mo in each domain were estimated by applying Ordinary Kriging using only data from within that domain. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures. An oriented "ellipsoid" search for each domain was used to select data for interpolation. Estimation search ellipse ranges were adjusted for each element in each domain based on the variogram ranges.

Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades for northings, eastings and elevation. These checks show good correlation between estimated block grades and drill sample grades.

Dr Sonia Delgado, Exec. Director Mr Fletcher Quinn, Non-Exec. Director Mr Pini Althaus , Non Exec Director Mr Brett Hackett Non Exec Director

A Lerchs-Grossman pit optimisation routine using inputs as described in Table 3 was used to determine that blocks > 0.3 g/t AuEq have reasonable prospects of future economic extraction by surface mining. Further models using similar input variable were used to identify a near surface optimised shell that was used to report the MRE at > 0.3 g/t AuEq block cut-off. Below the optimised shell, blocks > 0.4 g/t AuEq are considered to have reasonable prospects of future economic extraction by bulk underground mining techniques.

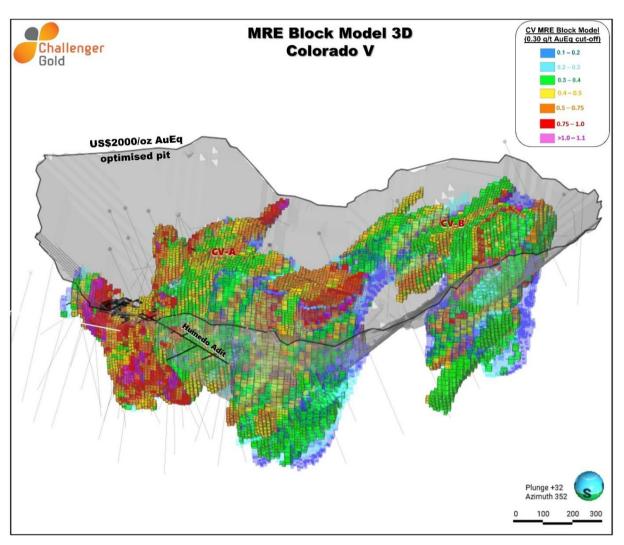

Figure 8 - View CV-A and CV-B MRE block models and the US\$2000 AuEq optimised pit shell

Resource Classification

The Mineral Resource has been classified as Indicated and Inferred based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters.

Mr Pini Althaus , Non Exec Director Mr Brett Hackett Non Exec Director Contact

The Colorado V deposit was sampled by drilling at nominal 100m spacing along strike. The central part of the northern domain has been infilled providing the confidence to upgrade this area to Indicated category.

A typical section through CV-A are given in Figures 2, and Figure 3 with Figure 5 a typical section through CV-B.

EL GUAYABO UPDATED MINERAL RESOURCE ESTIMATE

The El Guayabo MRE was updated using the results from

- an additional 4 diamond core drill holes for 2594 metres; and
- 3058 metres of surface and underground channel sampling;

for which assays were received after the 10 May 2023 cut off for the maiden El Guayabo MRE.

The rock-saw sampling is done using a rock saw to cut and recover a continuous channel measuring approximately 4cm x 4cm along any outcrop. The 4cm x 4cm sample weight averages 4.8 kg per metre, approximately the same as the NQ sized drill core in the El Guayabo Project drill program. The samples are logged and submitted for assay with QAQC samples (duplicates, blanks and standards) using the same procedure as drill core. It is expected that the data can be incorporated into a resource estimation in the same way as drilling results.

The Resource estimate also used results from a CEL surface and underground channel sampling campaign and historic drill holes results that have been verified by CEL re-assaying, drilling and geological modelling. Halved drill core is sampled over intervals from 0.5 to 2.0 metres according to lithology and alteration contacts.

Four separate mineralised domains were wireframed using drill hole data loaded in Micromine Origin and Leapfrog. Two lower-grade domains each with separate internal higher-grade domains which were designed to limit the influence of the high-grade assays. Each broad domain was constrained by interpreted geological continuity with mineralisation > 0.2 g/t AuEq and a 200 metre range to limit the extent of the mineralisation in each domain. The high-grade domains were constrained by interpreted geological continuity with sample mineralisation > 0.7 g/t AuEq.

The average length of a sample in the mineralised domains is approximately 1.5 metres. Three metre composites were used in the lower-grade domains with two metre composites in higher-grade subdomains. Within each domain, estimation was made for Au Ag, Cu and Mo being the elements of economic interest.

Assumed density is 2.73 g/cm³ (2.730 g/cc) which is the median SG value of 379 representative samples of core that were made during the core logging process. The SG values measured had a tight range which was independent of lithology and assay values.

Mr Brett Hackett Non Exec Director

A block model was set up in Surpac™ V6.6 software with a parent cell size of 20m (E) x 20m (N) x 20m (RL) was used in the two broad lower-grade domains with sub-blocks to 10m (E) x 10m (N) x 10m (RL) to maintain the resolution of the mineralised domains. A parent cell size of 10m (E) x 10m (N) x 10m (RL) in the two higher-grade sub-domains. Variography was carried out using Leapfrog Edge software on the composited data from each of the 4 domains for each variable.

All of the relevant variables; Au, Ag, Cu and Mo in each domain were estimated by applying Ordinary Kriging using only data from within that domain. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures. An oriented "ellipsoid" search for each domain was used to select data for interpolation.

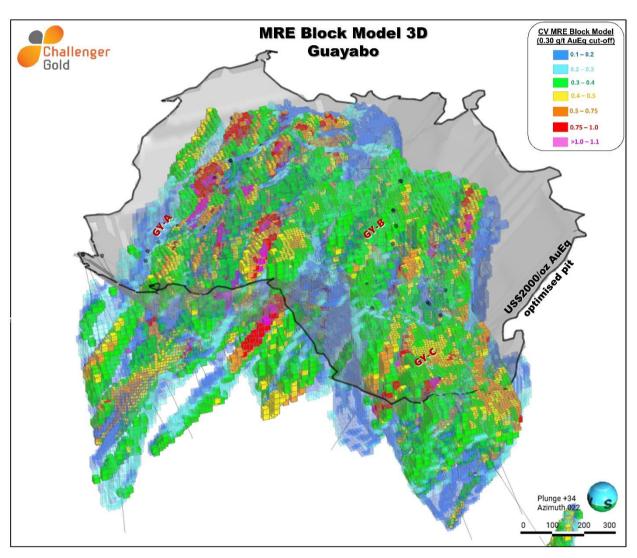

Figure 9 - View GY-A, GY-B and GY-C MRE block model and the US\$2000 AuEq optimised pit shell

Mr Eduardo Elsztain, Non-Exec, Chair Mr Kris Knauer, MD and CEO Mr Sergio Rotondo, Exec. Vice Chair Dr Sonia Delgado, Exec. Director Mr Fletcher Quinn, Non-Exec. Director Mr Pini Althaus , Non Exec Director Mr Brett Hackett Non Exec Director

T: +61 8 6385 2743 E: admin@challengergold.com

The estimation search strategy was undertaken in one pass with classification of the resource into Inferred category.

Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades for northings, eastings and elevation. These checks show good correlation between estimated block grades and drill sample grades.

A Lerchs-Grossman pit optimisation routine using inputs as described in Table 4 was used to determine that blocks > 0.3 g/t AuEq have reasonable prospects of future economic extraction by surface mining. Further models using similar input variable were used to identify a near surface optimised shell that was used to report the MRE at > 0.3 g/t AuEq block cut-off. Below the optimised shell, blocks > 0.4 g/t AuEq are considered to have reasonable prospects of future economic extraction by bulk underground mining techniques.

Top Cuts

A statistical analysis was undertaken on the sample composites with top cuts initially applied to the Au, Ag, Cu and Mo composites on a domain-by-domain basis.

Top cuts were applied to the grouped domains in order to reduce the influence of extreme values on the MRE without downgrading the high-grade composites too severely. The top-cut values were chosen by assessing the high-end distribution (tail) of the grade population within each group and selecting the uppermost outlier value above which the distribution became too heavily skewed. The top cuts applied in each of the four domains are shown in Table 6.

Domain	Au Top-cut (g/t)	Ag Top-cut (g/t)	Cu Top-cut (%)	Mo Top-cu (ppm)t
2 - GY-A Low Grade Domain	5	11	n/a	100
3 - GY-B Low Gr4ade Domain	4	11	n/a	100
22 - GY-A High-Grade sub-domain	10	70	n/a	200
23 - GY-B High-grade sub domain	11	70	n/a	150

Table 6 - Top cuts Applied to each Domain (n/a; no top cut applied)

NEXT STEPS

The Company has previously announced that it intends to monetise its Ecuador assets to focus on the near-term high-grade production opportunity at CEL's flagship Hualilan Gold project. The Company has determined little value is currently attributed by the market to the existing 6.9 Moz AuEq¹ net MRE and the substantial exploration potential of its Ecuadorian assets as they currently stand.

¹ Reported as Gold Equivalent (AuEq) values – for requirements under the JORC Code see page 5

With the completion of the maiden Colorado-V and upgrade of the El Guayabo MRE the Company is now positioned to advance the monetisation process. Monetisation options include listing the Company's Ecuador assets on the Toronto Stock Exchange (or other recognised international exchange), a trade sale or farm-in.

This ASX release was approved by the CEL Board.

ADDITIONAL INFORMATION

COMPETENT PERSON STATEMENT – EXPLORATION RESULTS AND MINERAL RESOURCES

The information that relates to sampling techniques and data, exploration results, geological interpretation and Mineral Resource Estimate has been compiled Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results and Mineral Resources. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

FORWARD LOOKING STATEMENTS

The announcement may contain certain forward-looking statements. Words 'anticipate', 'believe', 'expect', 'forecast', 'estimate', 'likely', 'intend', 'should', 'could', 'may', 'target', 'plan', 'potential' and other similar expressions are intended to identify forward-looking statements. Indication of, and guidance on, future costings, earnings and financial position and performance are also forward-looking statements.

Such forward looking statements are not guarantees of future performance, and involve known and unknown risks, uncertainties and other factors, many of which are beyond the control of Challenger Gold Ltd, its officers, employees, agents and associates, which may cause actual results to differ materially from those expressed of implied in such forward-looking statements. Actual results, performance, or outcomes may differ materially from any projections or forward-looking statements or the assumptions on which those statements are based.

You should not place any undue reliance on forward-looking statements and neither. Challenger nor its directors, officers, employees, servants or agents assume any responsibility to update such information. The stated Production Targets are based on the Company's current expectations of future results or events and should not be relied upon by investors when making investment decisions. Further evaluation work and appropriate studies are required to establish sufficient confidence that this target will be met.

Financial numbers, unless stated as final, are provisional and subject to change when final grades, weight and pricing are agreed under the terms of the offtake agreement. Figures in this announcement may not sum due to rounding.

The Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the estimates in the relevant original market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

HUALILAN GOLD PROJECT MRE AND SCOPING STUDY

All references to the Scoping Study and its outcomes in this announcement relate to the ASX Announcement of 8 November 2023 'Hualilan Gold Project Scoping Study'. Please refer to that announcement for full details and supporting documentation.

Table 7: Hualilan Hold Project Mineral Resource Estimate (March 2023)

Domain	Category	Mt	Au (g/t)	Ag (g/t)	Zn (%)	Pb (%)	AuEq (g/t)	AuEq (Mozs)

	Inferred	2.8	2.1	12.4	1.1	0.07	2.8	0.24
Total		60.6	1.1	6.0	0.4	0.06	1.4	2.8

Note: Some rounding errors may be present

¹ Gold Equivalent (AuEq) values - Requirements under the JORC Code

- Assumed commodity prices for the calculation of AuEq is Au US\$1900 Oz, Ag US\$24 Oz, Zn US\$4,000/t, Pb US\$2000/t
- Metallurgical recoveries are estimated to be Au (95%), Ag (91%), Zn (67%) Pb (58%) across all ore types (see JORC Table 1 Section 3 Metallurgical assumptions) based on metallurgical test work.
- The formula used: $AuEq (g/t) = Au (g/t) + [Ag (g/t) \times 0.012106] + [Zn (%) \times 0.46204] + [Pb (%) \times 0.19961]$
- CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

JORC Code, 2012 Edition - Table 1 Report Template

Section 1: Sampling Techniques and Data -El Guayabo Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	 Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	 CEL Drilling (El Guayabo and Colorado V): CEL have drilled HQ diamond core which is sampled by cutting the core longitudinal into two halves. One half is retained for future reference and the other half is sent for sampling. Sampling is done according to the geology. Sample lengths range from 0.5 to 2.5 metres. The average sample length is 1.5m. Samples are prepared at SGS Laboratories in Guayaquil for 30g fire assay and 4-acid digest ICPM: and then assayed in SGS Lima. The sample size is considered representative for the geology and style of mineralisation intersected. All the core is sampled for assay. Historic Drilling (El Guayabo): Newmont Mining Corp (NYSE: NEM) ("Newmont") and Odin Mining and Exploration Ltd (TSX: ODN) ("Odin") core drilled the property between February 1995 and November 1996 across two drilling campaigns. The sampling techniques were reviewed as part of a 43-101 Technical report on Cangrejos Property which also included the early results of the El Joven joint venture between Odin and Newmont, under which the work on the El Guayabo project was undertaken. This report is dated 27 May 2004 and found the sampling techniques and intervals to be appropriate with adequate QA/QC and custody procedures, core recoveries generally 100%, and appropriate duplicates and blanks use for determining assay precision and accuracy. Duplicates were prepared by the Laboratory (Bonder Cleg) which used internal standards. Newmont also inserted its own standards at 25 sample intervals as a control on analytical quality Diamond drilling produced core that was sawed in half with one half sent to the laboratory for assaying per industry standards and the remaining core retained on site. Cu assays above 2% were not re-assayed using a technique calibrated to higher value Cu results hence the maximum reported assay for copper is 2%. All core samples were analysed using a standa

Criteria	JORC Code explanation	Commentary
Drilling techniques	 Drill type (eg core, reverse circulation, openhole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	 CEL Drilling (El Guayabo and Colorado V): Diamond core drilling from surface collecting HQ core (standard tube). The core is not oriented. Historic Drilling: El Guayabo:
Drill sample recovery	 Method of recording and assessing core and chip sample recoveries and results assessed. Measures taken to maximise sample recovery and ensure representative nature of the samples. Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	 CEL Drilling (El Guayabo and Colorado V): Core run lengths recovered are recorded against the drillers depth markers to determine core recovery. Core sample recovery is high using standard HQ and NQ drilling No relationship between sample recovery and grade has been observed. Historic Drilling: El Guayabo: In a majority of cases core recovery was 100%. In the historical drill logs where core recoveries were less than 100% the percentage core recovery was noted. No documentation on the methods to maximise sample recovery was reported in historical reports however inspection of the available core and historical drilling logs indicate that core recoveries were generally 100% with the exception of the top few metres of each drill hole. No material bias has presently been recognised in core. Observation of the core from various drill holes indicate that the rock is generally fairly solid even where it has been subjected to intense, pervasive hydrothermal alteration and core recoveries are generally 100%. Consequently, it is expected that the samples obtained were not unduly biased by significant core losses either during the drilling or cutting processes Colorado V: Core from Goldking has been re-boxed prior to sampling where boxes have deteriorated, otherwise the original boxes have been retained. Core lengths have been measured and compared to the depth tags that are kept in the boxes from the drilling and recovered lengths have been recorded with the logging.

Criteria	JORC Code explanation	Commentary
		 chips are collected from surface expose in creeks. Sampling is done so as to represent the material being mapped. The sample size is appropriate for the grain size of the material being sampled. Colorado V: No information is available on the method/s that have been used to collect the soil samples. Selected intervals of drill core have been cut longitudinally using a diamond saw and ½ core has been sampled. Sample intervals range from 0.1m to 4.5m with an average length of 1.35m. The size of the samples is appropriate for the mineralisation observed in the core. Re-sampling of the core involves cutting of ¼ core (where previously sampled) or ½ core where not previously sampled. ¼ or ½ core over intervals of 1-3 metres provides an adequate sample size for the material being sampled.
Quality of assay data and laboratory tests	 The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	 El Guayabo: CEL: Camp #1, Phase#1 All drill core collected by CEL has been crushed to a nominal 2mm size. A 500 g sub-sample has been pulverized to 85% passing 75 micron at the SGS Laboratory in Guayaquil. Sub-samples of the pulps have been analyzed by SGS for Au by Fire Assay (30g) with AAS determination and gravimetric determination where over limit. Sub-samples of the pulps are also assayed for a multi element suite by 4-acid digest with ICPMS determination (including Cu, Mo, Ag, Zn, Pb, S and Fe). All assay techniques are partial assays of the total sample. Samples submitted by CEL include standards (CRM), blanks and duplicate samples to provide some control (QAQC) on the accuracy and precision of the analyses. 6 different CRM pulp samples have been submitted with the core samples. All 6 are certified for Au, 2 are certified for Ag, 5 are certified for Cu, 1 is certified for Fe and 3 are certified for Mo. For Au, of 222 CRM pulp analyses, 215 are within +/- 2 SD (97%) For Ag, of 54 CRM pulp analyses, all are within +/- 2 SD (100%) For Cu, of 126 CRM pulp analyses, 125 are within +/- 2 SD (99%) For Mo, of 83 CRM pulp analyses, 63 are within +/- 2 SD (98%) For Fe, of 65 CRM pulp analyses, 63 are within +/- 2 SD (97%) 118 samples of pulp that are known to have a blank Au value have been included with the samples submitted. 16 samples returned Au values of >5 ppb (up to 11 ppb) indicating only mild instrument calibration or contamination during fire assay. 337 % core duplicate samples have been submitted. The duplicate analyses for Au, Ag, Cu, Pb, Zn, As and Mo have been analysed. The duplicate sample analyses follow very closely the original analyses providing assurance that the sample size and technique is appropriate.

CEL: Camp #1, Phase#2

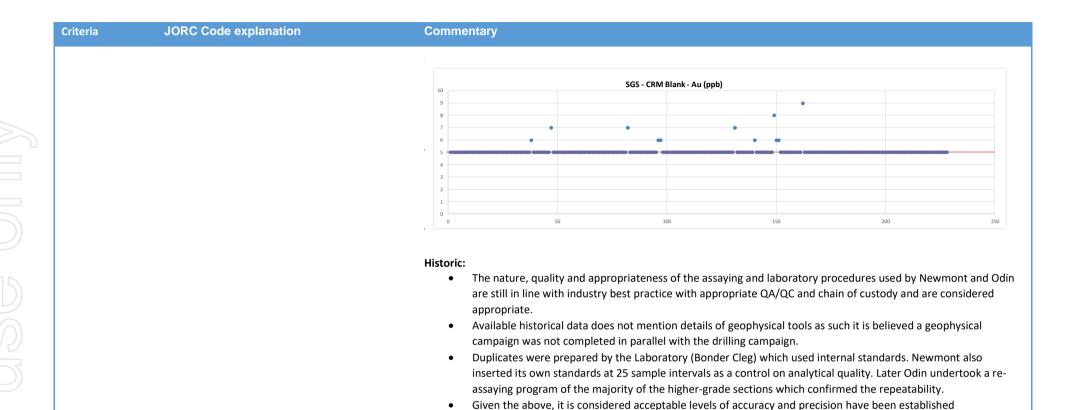

- All drill core collected by CEL has been crushed to a nominal 2mm size. A 500 g sub-sample has been pulverized
 to 85% passing 75 micron at the SGS Laboratory in Guayaquil. Sub-samples of the pulps have been analyzed by
 SGS for Au by Fire Assay (30g) with AAS determination and gravimetric determination where over limit. Subsamples of the pulps are also assayed for a multi element suite by 4-acid digest with ICPMS determination
 (including Cu, Mo, Ag, Zn, Pb, S and Fe). All assay techniques are partial assays of the total sample.
- Samples submitted by CEL include standards (CRM), blanks and duplicate samples to provide some control (QAQC) on the accuracy and precision of the analyses.
- 7 different CRM pulp samples have been submitted with the core samples. All 7 are certified for Au, 3 are certified for Ag, All 7 are certified for Cu, 1 is certified for Fe and 4 are certified for Mo.
- For Au, of 453 CRM pulp analyses, 445 are within +/- 2 SD (98%)
- For Ag, of 155 CRM pulp analyses, 150 are within +/- 2 SD (97%)
- For Cu, of 453 CRM pulp analyses, 444 are within +/- 2 SD (98%)
- For Mo, of 286 CRM pulp analyses, 272 are within +/- 2 SD (95%)
- For Fe, of 2 CRM pulp analyses, All are within +/- 2 SD (100%)
- 228 samples of pulp that are known to have a blank Au value have been included with the samples submitted. 11 samples returned Au values of >5 ppb (up to 9 ppb) indicating only mild instrument calibration or contamination during fire assay.
- 671 ½ core duplicate samples have been submitted. The duplicate analyses for Au, Ag, Cu, Pb, Zn, As and Mo have been analysed. The duplicate sample analyses follow very closely the original analyses providing assurance that the sample size and technique is appropriate.

Criteria **JORC Code explanation** Commentary SGS - CRM Blank - Au (ppb) 13 11 . . 160 **Historic:** No information is available on the methods used to analyse the historic soil or drill core samples. Assay results are not provided in this report. Soil samples have been analysed by GK for Au, Cu, Ag, Zn, Pb, As, Mn, Ni, Cr, Mo, Sn, V, Ti, Co, B, Ba, Sb, Bi and Hg. Pulps have been securely retained and check assaying is planned. Drill core was partially assayed for gold only with assays undertaken by Goldking's on site laboratory CEL samples of drill core re-sampled by CEL. Blanks and CRM (standards) were added to the batches to check sample preparation and analysis. 3 separate CRM's were included in the batches sent for analysis. All three have certified Au values. The results of the analysis of the CRM are shown below. With a few exceptions, the CRM has returned results within +/- 2 SD of the certified reference value. There is no bias in the results returned from either SGS or ALS laboratories.

CRM3 analyses by fire assay at SGS did not include overlimit (>10 g/t).

- No duplicate samples have been submitted.
- Two different blanks have been included randomly within the sample batches. A CRM blank with a value of <0.01 ppm (10 ppb) Au was used initially. More recent batches have used a blank gravel material which has no certified reference value. The results are shown below. The first 4 gravel blanks show elevated Au values which is believed to be due to contamination of the blank prior to submission and not due to laboratory contamination. With one exception, the blanks have returned values below 10 ppb.

Verification of sampling and assaying

- The verification of significant intersections by either independent or alternative company personnel.
- The use of twinned holes.
- Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.
- Discuss any adjustment to assay data.

CEL Drilling (El Guayabo and Colorado V):

- Samples from significant intersections have not been checked by a second laboratory. No holes have been twinned.
- Data from logging and assaying is compiled into a database at the Project and is backed up in a secure location. CEL GIS personnel and company geologists check and verify the data. No adjustments are made to any of the assay data.

Historic:

El Guayabo:

- All intersections with results greater than 0.5 g/t were re-assayed using the "blaster" technique a screen type fire analysis based on a pulverized sample with a mass of about 5 kg. Additionally, Odin re-assayed the many of the higher-grade sections with re-assay results demonstrating repeatability of the original results.
- Neither Newmont nor Odin attempted to verify intercepts with twinned holes
- Data was sourced from scanned copies of original drill logs and in some cases original paper copies of assay sheets are available. This data is currently stored in a drop box data base with the originals held on site.
- No adjustments to assay data were made.
- CEL assay data has not been independently verified or audited. Data is stored electronically in MS Excel and PDF format from the Laboratory and entered into a Project database for analysis. There has been no adjustment of the data.

Criteria	JORC Code explanation	Commentary
		 Colorado V: There is no information available on the verification of sample and assay results. No assay data is provided in this report. Soil replicate samples and second split assay results have been provided but not fully analysed at this stage. Of the 4,495 soil samples in the GK database, 166 are replicate samples and 140 are second split re-analyses. 37 samples have no coordinates in the database.
Location of data points	 Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	 CEL Drilling (El Guayabo and Colorado V): Drill hole collars are surveyed after the drilling using a DGPS. The co-ordinate system used is PSAD 1956, UTM zone 17S. Down-hole surveys are performed at regular intervals down hole (nominally 50 metres or as required by the geologist) during the drilling of the hole to ensure the hole is on track to intersect planned targets. Down hole surveys are done using a magnetic compass and inclinometer tool fixed to the end of the wire line. Down hole surveys are recorded by the drillers and sent to the geologist and GIS team for checking and entry into the drill hole database.
		Historic: El Guayabo: Newmont undertook survey to located drill holes in accordance with best practice at the time. No formal check surveying has been undertaken to verify drill collar locations at this stage Coordinate System: PSAD 1956 UTM Zone 17S Projection: Transverse Mercator Datum: Provisional S American 1956 Quality of topographic control appears to be+ - 1 meter which is sufficient for the exploration activities undertaken. Rock chip samples have been located using topographic maps with the assistance of hand-held GPS. Colorado V: Coordinate System: PSAD 1956 UTM Zone 17S Projection: Transverse Mercator Datum: Provisional S American 1956 No information is available on the collar and down-hole survey techniques used on the Colorado V concession. Rock chip sample locations are determined by using a handheld GPS unit which is appropriate for the scale of the mapping program being undertaken.

Criteria	JORC Code explanation	Commentary
Data spacing and distribution	 Data spacing for reporting of Exploration Results. Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. Whether sample compositing has been applied. 	
Orientation of data in relation to geological structure	 Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	 Drill pads are located in the best possible location to ensure there is no bias introduced, subject to the
Sample security	- The measures taken to ensure sample security.	 CEL Samples (El Guayabo and Colorado V): All CEL samples are held in a secure compound from the time they are received from the drillers to the time they are loaded onto a courier truck to be taken to the laboratory. The logging and sampling is done in a fenced and gated compound that has day and night security. Samples are sealed in bags and then packed in secure poly weave bags for transport
		 Historic: El Guayabo: Newmont sent all its field samples to the Bondar Clegg sample preparation facility in Quito for preparation. From there, approximately 100 grams of pulp for each sample was air freighted to the Bondar Clegg laboratory (now absorbed by ALS-Chemex) in Vancouver, for analysis. There is no record of any special steps to monitor the security of the samples during transport either between the field and Quito, or between Quito and Vancouver. However, Newmont did insert its own standards at 25 sample intervals as a control on analytical quality. CEL samples are kept in a secure location and prepared samples are transported with appropriate paperwork, securely by registered couriers. Details of the sample security and chain of custody are kept at the Project office for future audits. Colorado V:
		GK analysed samples in an on-site laboratory. It is understood that the samples have remained on site at all

Section 2: Reporting of Exploration Results -El Guayabo Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	 Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. 	 The El Guayabo (Code. 225) mining concession is located within El Oro Province. The concession is held by Torata Mining Resources S.A (TMR S.A) and was granted in compliance with the Mining Act ("MA") in on April 27, 2010. The are no overriding royalties on the project other than normal Ecuadorian government royalties. The property has no historical sites, wilderness or national park issues. The mining title grants the owner an exclusive right to perform mining activities, including, exploration, exploitation and processing of minerals over the area covered by the prior title for a period of 25 years, renewable for a further 2 years. Under its option agreement, the owner has been granted a negative pledge (which is broadly equivalent to a fixed and floating charge) over the concession. In addition, a duly notarized Irrevocable Promise to Transfer execute by TMR S.A in favor of AEP has been lodged with the Ecuador Mines Department. The Colorado V mining concession (Code No. 3363.1) located in Bellamaria, Santa Rosa, El Oro, Ecuador was granted compliance with the Mining Act ("MA") in on July 17, 2001. It is adjacent to El Guayabo concession to the north. The concession is held by Goldking Mining Company S.A. There are no overriding royalties on the project other than normal Ecuadorian government royalties. The El Guayabo 2 (Code. 300964) mining concession is located Torata parish, Santa Rosa canton, El Oro province, Ecuador. The concession is held by T Mr. Segundo Ángel Marín Gómez and Mrs. Hermida Adelina Freire Jaramillo an was granted in compliance with the Mining Act ("MA") on 29April 29, 2010. There are no overriding royalties on the project other than normal Ecuadorian government royalties. The property has no historical sites, wilderness, or national park issues.
Exploration done by other parties	- Acknowledgment and appraisal of exploration by other parties.	 El Guayabo: Previous exploration on the project has been undertaken by Newmont and Odin from 1994 to 1997. This included surface pit and rock chip geochemistry, followed by the drilling of 33 drill holes for a total of 7605.52 meters) to evaluate the larger geochemical anomalies. The collection of all exploration data by Newmont and Odin was of a high standard and had appropriate sampling techniques and intervals, adequate QA/QC and custody procedures, and appropriate duplicates and blanks used for determining assay precision and accuracy. The geological interpretation of this data, including core logging and follow up geology was designed and directed by in-country inexperienced geologists. It appears to have been focused almost exclusively for gold targeting surface go anomalies or the depth extensions of higher-grade gold zones being exploited by the artisanal miners. The geologic logs for all drill holes did not record details that would have been typical, industry standards for porphyry copper

Criteria	JORC Code explanation	Commentary
		 exploration at that time. Several holes which ended in economic mineralisation have never been followed up. In short, important details which would have allowed the type of target to be better explored were missed which in turn presents an opportunity to the current owner. Colorado V: All exploration known has been completed by GK. Drilling has been done from 2016 to 2019. 56 drill holes, totaling 21,471.83m have been completed by GK. El Guayabo 2: Exploration work undertaken by the previous owner was limited to field mapping and sampling including assaying of a
		small number of samples for gold, silver, copper, lead and zinc. The report is only available in Spanish and assays were conducted in a local laboratory in Ecuador with the majority of this work undertaken in 2017.
Geology	 Deposit type, geological setting and style of mineralisation. 	 It is believed that the El Guayabo, El Guayabo 2, and Colorado V concessions contain a "Low Sulfide" porphyry gold copper system and intrusive-related gold. The host rocks for the intrusive complex is metamorphic basement and Oligocene – Mid-Miocene volcanic rocks. This suggests the intrusions are of a similar age to the host volcanic sequence, which also suggests an evolving basement magmatic system. Intrusions are described in the core logs as quartz diorite and dacite. Mineralization has been recognized in: Steeply plunging breccia bodies (up to 200 m in diameter) associated with intrusive diorites emplaced in the metamorphic host rock. Porphyry style veins and stockwork as well as late Quartz/Calcite/sulfide veins and veinlets Disseminated pyrite and pyrrhotite in the intrusions and in the metamorphic host rock near the intrusions.
Drill hole Information	 A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: easting and northing of the drill hole collar elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar dip and azimuth of the hole down hole length and interception depth hole length. If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why 	El Guayabo Historic drill hole information is provided below.

Data aggregation methods	 In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated. 	 Minimum cut Aggregate int bottom cut or consistent nat grade results over half of the only 20% of the over one thire. 		Colorado V:								

Colorado V:

A cut-off grade of 0.1 g/t Au was used to report the assays of re-samples core and channel samples from underground development with up to 10 metres of internal dilution below cut-off allowable for the reporting of significant intercepts, consistent with a large low-grade mineralized system. Intersections that use a different cut-off are indicated.

CEL: Guayabo and Colorado V Concessions Camp 1, Phase #1 & Phase #2 Drilling Intercepts:

A cut-off grade of 0.1 g/t Au was used to report the assays of core samples with up to 10 metres of internal dilution below cut-off allowable for the reporting of significant intercepts, consistent with a large low-grade mineralized system. Intersections that use a different cut-off are indicated (e.g. 0.2g/t Au Eq, 0.5g/t AuEq, 1.0g/t AuEq, 10.0g/t AuEq).

CEL: Significant intersections from El Guayabo Project (Guayabo Concession)_Camp #1, Phase #1 Drilling completed

JORC Code explanation Commentary Criteria widths and The preliminary interpretation is that the breccia hosted mineralisation occurs in near vertical breccia pipes. Thus, intersections in steeply the reporting of intercept Exploration Results. inclined holes may not be representative of the true width of this breccia hosted mineralisation. The relationship between the drilling lenaths If the aeometry of the orientation and some of the key mineralised structures and possible reporting bias in terms of true width is illustrated in the figure below. mineralisation with Interbedded metasediments and HYDROTHERMAL BRECCIA QUARTZ DIORITE Disseminated Sulphides (Cpy, some Py, Po) respect to the drill hole Silicification and Chlorite / Sericite alteration 116 m @ 0.3 g/t Au (Au assays only 116 m @ 0.6 g/t Au + 8.9 g/t Ag + 0.4% Cu 221 m @ 0.2 g/t Au + 3 g/t Ag + 0.1% Cu Note: combined intercent 112 m @ 0.7 g/t Au + 4.6 g/t Ag + 0.6% Cu angle is known, its Metasediments nature should be Altered GREY, QUARTZITIC BRECCIA 112 m @ 0.4 g/t Au (Au assays only) and DACITE intrusive Note: combined intercept Mod to strong alteration (quartz, sericite, reported. carbonate, Po - Cpy - Sph - Aspy, hydrothermal fracturing) 69.0 m @ 1.6 g/t Au+2.3 g/t Ag+ 0.03% Cu 156.0 m @ 2.6 g/t Au+9.7 g/t Ag+ 0.2% Cu Andalusite rich metasediments If it is not known and 145 m @ 0.4 g/t Au (Cpy- Au assays only) and 44 m @ 0.4 g/t Au (Cpy- Au assays only) only the down hole lengths are reported, there should be a clear 900m statement to this effect (eg 'down hole length, 800 true width not known'). 	appropriate sectional views.	
Balanced reporting	 Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	 The reporting is fair and representative of what is currently understood to be the geology and controls on mineralisation at the project.
Other substantive exploration data	- Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	El Guayabo: Quantec Geophysical services conducted a SPARTAN Broadband Magnetotelluric and TITAN IP/EMAP surveys complete. February 3rd to April 1st, 2019 over the El Guayabo property by Quantec Geoscience Ltd. on behalf of AAR Resources. The survey covered 16 square kilometersa with data collected on 300m 3D spacing on a gride oriented at 10 degerees and 100 degerees. The grid was moved 10 degrees so the survey could be orineted perpendicu; lar to the main geological structures. The survey involved a total of 205 Magnetotelluric (MT) sites and 2 test TITAN IP/EMAP profiles were surveyed. The final survey results to which will be delivered will consist of: Inversion 2D products Description of the: Description of the: Description of the: Description of the: MT(EMAP) resistivity model using the DC resistivity model as a reference; MT(EMAP) resistivity model; Joint MT+DC resistivity model; Inversion 3D products MT model; Cross-sections and Elevation Plan maps of the 3D MT models;
		DCIP INVERSION PROCEDURES DCIP is an electrical method that uses the injection of current and the measurement of voltage difference along with its rat of decay to determine subsurface resistivity and chargeability respectively. Depth of investigation is mainly controlled by th array geometry but may also be limited by the received signal (dependent on transmitted current) and ground resistivity. Chargeability is particularly susceptible to data with a low signal-to-noise ratio. The differences in penetration depth betwee DC resistivity and chargeability are a function of relative property contrasts and relative signal-to-noise levels between the two measurements. A detailed introduction to DCIP is given in Telford, et al. (1976). The primary tool for evaluating data in

JORC Code explanation Criteria Commentary through the inversion of the data in two or three dimensions. An inversion model depends not only on the data collected, but also on the associated data errors in the reading and the "model norm". Inversion models are not unique and may contain "artefacts" from the inversion process. The inversion model may not accurately reflect all the information apparent in the actual data. Inversion models must be reviewed in context with the observed data, model fit, and with an understanding of the model norm used. The DC and IP inversions use the same mesh. The horizontal mesh is set as 2 cells between electrodes. The vertical mesh is designed with a cell thickness starting from 20 m for the first hundred metres to accommodate the topographic variation along the profiles, and then increases logarithmically with depth. The inversions were generally run for a maximum of 50 iterations. The DC data is inverted using an unconstrained 2D inversion with a homogenous half-space of average input data as starting model. For IP inversions, the apparent chargeability \square is computed by carrying out two DC resistivity forward models with conductivity distributions $\sigma(xi,zj)$ and $(1-\eta)\sigma(xi,zj)$ (Oldenburg and Li, 1994), where (xi,zj) specifies the location in a 2D mesh. The conductivity distributions used in IP inversions can be the inverted DC model or a half space of uniform conductivity. Two IP inversions are then calculated from the same data set and parameters using different reference models. The first inversion of the IP data uses the previously calculated DC model as the reference model and is labelled the IP dcref model. The second IP inversion uses a homogeneous half-space resistivity model as the reference model and is labelled IP hsref model. This model is included to test the validity of chargeability anomalies, and to limit the possibility of inversion artefacts in the IP model due to the use of the DC model as a reference. The results of this second IP inversion are presented on the digital archived attached to this report. **MAGNETOTELLURIC INVERSIONS** The Magnetotelluric (MT) method is a natural source EM method that measures the variation of both the electric (E) and magnetic (H) field on the surface of the earth to determine the distribution at depth of the resistivity of the underlying rocks. A complete review of the method is presented in Vozoff (1972) and Orange (1989). The measured MT impedance Z, defined by the ratio between the E and H fields, is a tensor of complex numbers. This tensor is generally represented by an apparent resistivity (a parameter proportional to the modulus of Z) and a phase (argument of Z). The variation of those parameters with frequency relates the variations of the resistivity with depth, the high frequencies sampling the sub-surface and the low frequencies the deeper part of the earth. However, the apparent resistivity and the phase have an opposite behaviour. An increase of the phase indicates a more conductive zone than the host rocks and is associated with a decrease in apparent resistivity. The objective of the inversion of MT data is to compute a distribution of the resistivity of the surface that explains the variations of the MT parameters, i.e. the response of the model that fits the observed data. The solution however is not unique and different inversions must be performed (different programs, different conditions) to test and compare solutions for artefacts versus a target anomaly. An additional parameter acquired during MT survey is the Tipper. Tipper parameters Tzx and Tzy (complex numbers) represent the transfer function between the vertical magnetic field and the horizontal X (Tzx), and Y (Tzy) magnetic fields respectively (as the impedance Z represent the transfer function between the electric and magnetic fields). This tipper is a 'local' effect, mainly defined by the lateral contrast of the resistivity. Consequently, the tipper can be used to estimate the geological strike direction. Another important use of the tipper is to display its components as vectors, named induction **Challenger Gold Limited Issued Capital Australian Registered Office** Directors

		vectors. The induction vectors (defined by the real components of Tzx and Tzy) plotted following the Parkinson-Real-Reverse-Angle convention will point to conductive zones. The tipper is then a good mapping tool to delineate more conductive zones. The depth of investigation is determined primarily by the frequency content of the measurement. Depth estimates from any individual sounding may easily exceed 20 km. However, the data can only be confidently interpreted when the aperture of the array is comparable to the depth of investigation. The inversion model is dependent on the data, but also on the associated data errors and the model norm. The inversion models are not unique, may contain artefacts of the inversion process and may not therefore accurately reflect all the information apparent in the actual data. Inversion models need to be reviewed in context with the observed data, model fit. The user must understand the model norm used and evaluate whether the model is geologically plausible. For this project, 2D inversions were performed on the TITTAN/EMAP profiles data. For each profile, we assume the strike direction is perpendicular to the profile for all sites: the TM mode is then defined by the inline E-field (and cross line H-field); no TE mode (cross line E-field) were used in the 2D inversions. The 2D inversions were performed using the TM-mode resistivity and phase data interpolated at 6 frequencies per decade, assuming 10% and 5% error for the resistivity and phase respectively, which is equivalent to 5% error on the impedance component Z. No static shift of the data has been applied on the data. The 3D inversion was carried out using the CGG RLM-3D inversion code. The 3D inversions of the MT data were completed over an area of approximately 5km x 3.5km. All MT sites from this current survey were used for the 3D inversion. The 3D inversion was completed using a sub sample of the MT data with a maximum of 24 frequencies at each site covering the measured data from 10 kHz to 0.01 Hz with a nominal

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	- Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection	The database includes both drilling completed by previous explorers, drill holes recently completed by the Company and underground channel samples completed by the Company.
	 and its use for Mineral Resource estimation purposes. Data validation procedures used. 	Drill core from historic drilling has been recently re-logged and re-sampled. These data are transcribed by the database / GIS team into a database held on site at EMSA offices in Totara, Ecuador. Only the drill hole collar and down-hole survey from the historic data has been directly transcribed from the historic data. All other data is newly generated.
		Logging data from channel samples and drill holes completed by the Company (Phase 1 and Phase 2) are transcribed into the same database as the historic data. Drill hole collar, survey, logging is captured directly into MS Excel and peer reviewed before being given to the database team. Final assay data received from the labs is reviewed (blanks, duplicates and standards) and then added to the database. Backup copies of all data are retained in separate files.
		The drill hole data is backed up and is updated periodically.
Site visits	 Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. 	CEL representatives have visited from 2019, during early-stage exploration and drilling. Early site visits were undertaken to review the progress of exploration prior to drilling and to review historic drill core. The most recent site visit was in June 2022 to review the geology, drilling program, collection of data, sampling procedures, sample submission and exploration program. Competent Persons that completed the NI-43-101 report for presentation to the TSX completed site visits in early 2024 in preparation for completing that report and undertaking the Foreign Resource Estimate according to Canadian NI43-101 reporting standards.
Geological interpretation	 Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect if any of alternative interpretations on Mineral Resource estimation. The use of geology in guiding and controlling Mineral Resource estimation. The factors affecting continuity both of grade and geology. 	The geological interpretation and understanding of the controls on mineralisation has been used to model the geometry of the mineralised system. El Guayabo is a high-level porphyry intrusive and intrusive-related breccia complex with mineralisation controlled by regional scale and local scale fault-fracture zones and lithology contacts. Multiple pulses of mineralisation are evident in the alteration and vein overprinting relationships. Given the available data and understanding of the geological controls on mineralisation, the Competent Person has confidence in the geological model that has been used to constrain the high grade and low grade mineralised domains. At the El Guayabo deposits, continuity of grade between drill holes is determined by the

Criteria	JORC Code explanation	Commentary
	 Any assumptions about correlation between variables. Description of how the geological interpretation was used to control the resource estimates. Discussion of basis for using or not using grade cutting or capping. The process of validation the checking process used the comparison of model data to drill hole data and use of reconciliation data if available 	Geostatistical modelling and variography for each domain and each variable were completed in Leapfrog Edge v5.1.2 and block modelling was undertaken in Leapfrog Geo software. A block model was set up with a parent cell size of 10m (E) x 10m (N) x 10m (RL). Variables in each domain were estimated using Ordinary Kriging. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures. An oriented "ellipsoid" search for each domain was used to select data for interpolation. Estimation search ellipse ranges were adjusted for each element in each domain based on the variogram ranges. Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades on a range of northings. These checks show good correlation between estimated block grades and drill sample grades. CEL completed a Mineral Resource Estimation that was reported to the ASX on 14 June 2024. No production records are available to provide comparisons.
Moisture	 Whether the tonnages are estimated on a dry basis or with natural moisture and the method of determination of the moisture content. 	Tonnage is estimated on a dry basis.
Cut-off parameters	 The basis of the adopted cut-off grade(s) or quality parameters applied. 	The following metals and metal prices have been used to report gold grade equivalent (AuEq) for the Foreign Mineral Resource: Au US\$ 1600/ oz, Ag US\$19.50/oz, Cu 3.00 US\$/ lb (US\$ 6,614/ t) and Mo US\$ 53,000/ t.
		No metallurgical test work has been completed on the mineralisation at El Guayabo. The Foreign Resource Estimate assumes all metals will have equivalent recovery. Accordingly, the formula used for Au Equivalent in the Foreign Resource Estimate is: $ \text{AuEq g/t} = \text{Au g/t} + (\text{Ag g/t} \times 0.012188) + (\text{Cu \%} \times 1.29) + (\text{Mo \%} \times 10.3). $

Criteria	JORC Code explanation	Commentary
	 representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. 	water and weight in air. The SG values across the different rock types and mineralisation styles are stable and so an average SG was applied for the whole block model to estimate the density. Of the SG values measure the range is 1.83 to 3.63 g/cc. The average value is 2.74 g/cc and the median value is 2.73 g/cc. A bulk density value of 2.73 g/cc (2,730 kg/m3) was applied to the blocks to estimate tonnage.
Classification	 The basis for the classification of the Mineral Resources into varying confidence categories. Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity and distribution of the data). Whether the result appropriately reflects the Competent Person's view of the deposit. 	The Foreign Mineral Resource has been classified based on the guidelines specified according to NI-43-101 which has resource categories that are similar to the JORC categories. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters and an analysis of available density information. The estimation search strategy was undertaken in one pass with classification of the Foreign Mineral Resource as Inferred.
Audits or reviews	- The results of any audits or reviews of Mineral Resource estimates.	The Foreign Mineral Resource estimate has not been independently audited or reviewed. CEL intends to review the Foreign Mineral Resource Estimate and update it to JORC reporting standards.
Discussion of relative accuracy/confidence	 Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. These statements of relative accuracy and confidence of the estimate should be compared with production data where available. 	There is sufficient confidence in the data quality, drilling methods and analytical results that they can be relied upon for resource estimation. No production data is available for comparison with block grades.

Section 3 Estimation and Reporting of Mineral Resources for El Guayabo Mineral Resource Estimate

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	 Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection and its use for Mineral 	The database includes both drilling completed by previous explorers, drill holes recently completed by the Company and underground channel samples completed by the Company.
	Resource estimation purposes Data validation procedures used.	Drill core from historic drilling has been recently re-logged and re-sampled. These data are transcribed by the database / GIS team into a database held on site at EMSA offices in Totara, Ecuador. Only the dri hole collar and down-hole survey from the historic data has been directly transcribed from the historic data. All other data is newly generated.
		Logging data from channel samples and drill holes completed by the Company (Phase 1 and Phase 2) are transcribed into the same database as the historic data. Drill hole collar, survey, logging is captured directly into MS Excel and peer reviewed before being given to the database team. Final assay data received from the labs is reviewed (blanks, duplicates and standards) and then added to the database. Back up copies of all data is retained in separate files.
		The drill hole data is backed up and is updated periodically.
Site visits	 Comment on any site visits undertaken by the Competent Person and the outcome of those visits. If no site visits have been undertaken indicate why this is the case. 	The Competent Person has undertaken site visits from 2019, during early-stage exploration and drilling. Early site visits were undertaken to review the progress of exploration prior to drilling and to review historic drill core. The most recent site visit was in June 2022 to review the geology, drilling program, collection of data, sampling procedures, sample submission and exploration program.
Geological interpretation	 Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit. Nature of the data used and of any assumptions made. The effect if any of alternative interpretations on Mineral Resource estimation. The use of geology in quiding and controlling Mineral 	The geological interpretation and understanding of the controls on mineralisation has been used to model the geometry of the mineralised system. El Guayabo is a high-level porphyry intrusive and intrusive-related breccia complex with mineralisation controlled by regional scale and local scale fault-fracture zones and lithology contacts. Multiple pulses of mineralisation are evident in the alteration and vein overprinting relationships. Given the available data and understanding of the geological controls on mineralisation, the Competent
	 The use of geology in guiding and controlling infineral Resource estimation. The factors affecting continuity both of grade and geology. 	Person has confidence in the geological model that has been used to constrain the high grade and low grade mineralised domains. At the El Guayabo deposits, continuity of grade between drill holes is determined by the intensity of fracturing, the host rock contacts (particularly intrusive – metamorphic sediment contacts). The high-grade mineralised domains have been built using explicit wireframe techniques using a nominal cut-off grade over a 2.0 metre interval of 0.7 – 1.0 g/t AuEq mineralised intersections, joined between holes

Criteria	JORC Code explanation	Commentary
		using the AuEq grade, geology and controlling structure. The Low-grade domain surrounding the high-grade has been generated using Leapfrog to build a 0.2 g/t AuEq isosurface, following the main NE to EN strike, dipping steeply NW with a nominal range of 200m. No alternative interpretations have been generated that form the basis for a Mineral Resource Estimate
Dimensions	 The extent and variability of the Mineral Resource expressed as length (along strike or otherwise) plan width and depth below surface to the upper and lower limits of the Mineral Resource. 	The Mineral Resource consists of 3 sub-parallel zones. GY-A has a NE strike of 0.9 kilometres dipping NW at 80 degrees, width of 0.4 kilometres and is estimate to a depth of 650 metres below surface. GY-B has a strike of 0.5 kilometres, dipping NW at 80 degrees, with of 0.2 kilometres and is estimated to a depth of 400 metres below surface. GY-C has a ENE strike of 0.8 kilometres, dipping NNW at 80 degrees, with of 0.2 kilometres and is estimated to a depth of 450 metres below surface. All 3 zones remain open in all directions.
Estimation and modelling techniques	 The nature and appropriateness of the estimation technique(s) applied and key assumptions including treatment of extreme grade values domaining interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used. The availability of check estimates previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. The assumptions made regarding recovery of by-products. 	Estimation was made for Au Ag, Cu and Mo being the elements of economic interest. No previous Resource Estimation has been done to compare to the current Resource estimate. No production records are available to provide comparisons. A 2 metre composite length in the high-grade domain and a 3 metre composite length in the low-grade domain was selected after reviewing the composite statistics. A statistical analysis was undertaken on the sample composites top cuts for Au, Ag, Cu and Mo composites for each domain. The top-cut values were chosen by assessing the high-end distribution of the grade population within each domain and selecting the value above which the distribution became erratic. The following table shows the top cuts applied to each group
	 Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation). In the case of block model interpolation the block size in relation to the average sample spacing and the search employed. Any assumptions behind modelling of selective mining units. Any assumptions about correlation between variables. Description of how the geological interpretation was used to control the resource estimates. Discussion of basis for using or not using grade cutting or 	DomainAu (ppm)Ag (ppm)Cu (%)Mo (ppm)High-grade (GY-A, GY-B)1070-200High-grade (GY-C)1170-150Low-grade (GY-A, GY-B)10Low-grade (GY-C)8 Block modelling was undertaken in Surpac™ V6.6 software. A block model was set up with a parent cell size of 10m (E) x 10m (N) x 10m (RL) for the high-grade domains and 20m (E) x 20m (N) x 20m (RL) for the low-grade domains. Group Variography was carried out using Leapfrog Edge software on composited data from each of the domains for each variable.

Criteria	JORC Code explanation	Commentary
	 capping. The process of validation the checking process used the comparison of model data to drill hole data and use of reconciliation data if available 	Variables in each domain were estimated using Ordinary Kriging. The orientation of the search ellipse and variogram model was controlled using surfaces designed to reflect the local orientation of the mineralized structures.
		An oriented "ellipsoid" search for each domain was used to select data for interpolation. Estimation search ellipse ranges were adjusted for each element in each domain based on the variogram ranges.
		Validation checks included statistical comparison between drill sample grades and Ordinary Kriging block estimate results for each domain. Visual validation of grade trends for each element along the drill sections was also completed in addition to swath plots comparing drill sample grades and model grades on a range of northings. These checks show good correlation between estimated block grades and drill sample grades.
Moisture	 Whether the tonnages are estimated on a dry basis or wi natural moisture and the method of determination of the moisture content. 	·
Cut-off parameters	 The basis of the adopted cut-off grade(s) or quality parameters applied. 	The following metals and metal prices have been used to report gold grade equivalent (AuEq): Au US\$ 1800 / oz Ag US\$22 /oz, Cu US\$ 9,000 /t and Mo US 44,080/t. Average metallurgical recoveries for Au, Ag, Zn and Pb have been estimated from similar projects in Ecuador. No metallurgical test work has been completed on the mineralisation at El Guayabo. For the AuEq calculation average metallurgical recovery is estimated as 85% for gold, 60% for silver, 85% for Cu and 50% for Mo. Accordingly, the formula used for Au Equivalent is: AuEq = Au g/t + (Ag g/t x 0.01222 x [60/85]) + (Cu % x [90/57.8778] x {85/85]) + (Mo % x 440.8/57.8778) x [50/85], or AuEq = Au g/t + (Ag g/t x 0.008627) + (Cu % x 1.555) + (Mo % x 4.480)
		Based on the break-even grade for an optimised pit shell for gold equivalent, a AuEq cut-off grade of 0.30 ppm is used to report the resource within an optimised pit shell run at a gold price of US\$1,800 per ounce and allowing for Ag, Cu and Mo credits. Under this scenario, blocks with a grade above the 0.30 g/t Au Eq cut off are considered to have reasonable prospects of mining by open pit methods. A AuEq cut-off grade of 0.40 ppm was used to report the resource beneath the optimised pit shell run as these blocks are considered to have reasonable prospects of future mining by bulk underground methods.

Criteria	JORC Code explanation	Commentary
Mining factors or assumptions	- Assumptions made regarding possible mining methods minimum mining dimensions and internal (or if applicable external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the mining assumptions made.	The Resource estimate has assumed that near surface mineralisation would be amenable to open pit mining. A surface mine optimiser has been used to determine the proportion of the Resource Estimat model that would be amenable to eventual economic extraction by open pit mining methods. The surface mine optimiser used the following parameters with prices in USD: - Au price of \$1,800 per oz, Ag price of \$22 per oz, Cu price of \$9,000 per tonne and Mo price \$44,080 per tonne - Average metallurgical recoveries of 85 % for Au, 60 % for Ag and 85 % for Cu and 50 % for Mound of the experimental processing cost of \$7.60 per tonne - Processing cost of \$7.60 per tonne - Refining, transport and marketing of \$60 / oz of AuEq - Royalty net of transport cost — 3% NSR - \$52.20/oz AuEq. - 47.5° overall pit slopes Blocks above a 0.30 g/t AuEq within the optimised open pit shell are determined to have reasonable prospects of future economic extraction by open pit mining and are included in the Resource estimate that basis. Blocks below the open pit shell that are above 0.40 g/t AuEq are determined to have reasonable prospects of future economic extraction by underground mining methods and are included in the Resource Estimate on that basis.
Metallurgical factors or assumptions	- The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.	No metallurgical test work has been completed on the El Guayabo mineralisation. Metallurgical assumptions are based on recovery by floatation of separate Cu-Au-Ag and Mo concentrates as is proposed for similar projects in Ecquador with transport and shipping of the concentrates from ports nearby to the Project. The following assumptions are based on test work reported by Lumina Gold at the nearby Cangrejos Project, which is part of the same intrusive complex El Guayabo. Gold – 85% (Lumina Gold PFS) Copper – 85% (PFS recovery is 79% but this is based on a mix of fresh (87%) and part oxidised (50%) whereas there is minimal oxidised material at El Guayabo - Lumina 43-101 report June 2022) Silver – 60% (PFS recovery is 55% but this is based on a mix of fresh (60%) and part oxidised (50%) whereas these is minimal oxidised material at El Guayabo) - Lumina 43-101 report June 2022) Molybdenum – 50% (Lumina 43-101 report June 2022)
Environmental factors or assumptions	 Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing 	It is considered that there are no significant environmental factors which would prevent mining. Mining is assumed to be crush, grind and sequential flotation with appropriate waste dump and tailing disposal. No detailed environmental impact studies have been completed.

Criteria	JORC Code explanation	Commentary
	operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.	
Bulk density	 Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. 	The Company has collected 379 specific gravity (SG) measurements from drill core, which have been used to estimate block densities for the Resource Estimate. Measurements we determined on a dry basis by measuring the difference in sample weight in water and weight in air. The SG values across the different rock types and mineralisation styles are stable and so an average SG was applied for the whole block model to estimate the density. Of the SG values measure the range is 1.83 to 3.63 g/cc. The average value is 2.74 g/cc and the median value is 2.73 g/cc. A bulk density value of 2.73 g/cc (2,730 kg/m3) was applied to the blocks to estimate tonnage.
Classification	 The basis for the classification of the Mineral Resources into varying confidence categories. Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity and distribution of the data). Whether the result appropriately reflects the Competent Person's view of the deposit. 	The Mineral Resource has been classified based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters and an analysis of available density information. The estimation search strategy was undertaken in one pass with classification of the resource into Inferred. The potential open pit resource was constrained within an optimised pit shell run using a gold price of \$1,800 per ounce. Blocks inside the pit shell were reported above a AuEq cut-off grade of 0.30 ppm and blocks outside the pit shell were reported above a AuEq cut-off grade of 0.40 ppm. The Resource Estimate is classified 100% Inferred. The Competent Person has reviewed the result and determined that these classifications are appropriate given the drill hole spacing, domain constraints and confidence in the geology, data and results from drilling.
Audits or reviews	 The results of any audits or reviews of Mineral Resource estimates. 	The Mineral Resource estimate has not been independently audited or reviewed.

Criteria	JORC Code explanation	Commentary
Discussion of relative accuracy/confidence	 Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. These statements of relative accuracy and confidence of the estimate should be compared with production data where available. 	There is sufficient confidence in the data quality, drilling methods and analytical results that they can be relied upon for the estimation technique applied. No alternative techniques have been applied to test the accuracy of the estimate. The approach and procedure applied is deemed appropriate given the confidence limits and Resource Category applied. The main factors which could affect relative accuracy are: - domain boundary extent and assumptions - orientation of the controlling structure - grade continuity and range modelling - composite top cuts. No production data is available for comparison with block grades.

	metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.	Colorado V. Gold – 85% (Lumina Gold PFS) Copper – 85% (PFS recovery is 79% but this is based on a mix of fresh (87%) and part oxidised (50%) whereas there is minimal oxidised material at Colorado V - Lumina 43-101 report June 2022) Silver – 60% (PFS recovery is 55% but this is based on a mix of fresh (60%) and part oxidised (50%) whereas these is minimal oxidised material at Colorado V) - Lumina 43-101 report June 2022) Molybdenum – 50% (Lumina 43-101 report June 2022)
Environmental factors or assumptions	 Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. 	It is considered that there are no significant environmental factors which would prevent mining. Mining is assumed to be crush, grind, gravity and sequential flotation with appropriate waste dump and tailings disposal. No detailed environmental impact studies have been completed.
Bulk density	 Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials. 	The Company has collected 410 specific gravity (SG) measurements from drill core, which have been used to estimate block densities for the Resource Estimate. Measurements we determined on a dry basis by measuring the difference in sample weight in water and weight in air. The SG values across the different rock types and mineralisation styles are stable and so an average SG was applied for the whole block model to estimate the density. The average and the median value is 2.73 g/cc. A bulk density value of 2.73 g/cc (2,730 kg/m3) was applied to the blocks to estimate tonnage.
Classification	 The basis for the classification of the Mineral Resources into varying confidence categories. Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity 	The Mineral Resource has been classified based on the guidelines specified in the JORC Code as Indicated and Inferred based on the guidelines specified in the JORC Code. The classification level is based upon semi-qualitative assessment of the geological understanding of the deposit, geological and mineralisation continuity, drill hole spacing, QC results, search and interpolation parameters. The Colorado V deposit was sampled by drilling at nominal 100m spacing along strike. The central part of the northern domain has been infilled providing the confidence to upgrade this area to Indicated

Criteria	JORC Code explanation	Commentary
	and distribution of the data) Whether the result appropriately reflects the Competent Person's view of the deposit.	category. The potential open pit resource was constrained within an optimised pit shell run using a gold price of US\$2,000 per ounce. Blocks inside the pit shell were reported above a AuEq cut-off grade of 0.30 ppm and blocks outside the pit shell were reported above a AuEq cut-off grade of 0.40 ppm. The Competent Person has reviewed the result and determined that these classifications are appropriate given the drill hole spacing, domain constraints and confidence in the geology, data and results from drilling.
Audits or reviews	 The results of any audits or reviews of Mineral Resource estimates. 	The Mineral Resource estimate has not been independently audited or reviewed.
Discussion of relative accuracy/confidence	 Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. These statements of relative accuracy and confidence of the estimate should be compared with production data where available. 	There is sufficient confidence in the data quality, drilling methods and analytical results that they can be relied upon for the estimation technique applied. No alternative techniques have been applied to test the accuracy of the estimate. The approach and procedure applied is deemed appropriate given the confidence limits and Resource Category applied. The main factors which could affect relative accuracy are: - domain boundary extent and assumptions - orientation of the controlling structure - grade continuity and range modelling - composite top cuts. No production data is available for comparison with block grades.
