

LARGE MINERALISED TARGET EMERGING AT LA BREA

Tesoro Gold Limited (Tesoro or the Company) (ASX: TSO, OTCQB: TSORF, FSE: 5D7) is pleased to announce significant surface sampling assay results from the La Brea target at its El Zorro Gold Project in Chile (**El Zorro**). Recent mapping and systematic outcrop channel sampling have delineated a potentially large new gold target at La Brea, which is located approximately 15km north of Tesoro's 1.5Moz (unconstrained) Ternera Gold Deposit (**Ternera Deposit**).

HIGHLIGHTS

- **Four major northwest mineralised trends have been identified, up to 200m wide and 4km long, highlighting the vast scale and potential of the La Brea target.**
- **Individual fault zones, and associated alteration mapped up to 4km long, returned high-grade gold including:**
 - 1.00m @ 9.32 g/t Au (EZTR004867)
 - 1.00m @ 22.10 g/t Au (EZTR005000)
 - 1.00m @ 11.80 g/t Au (EZTR005065)
 - 1.00m @ 9.38 g/t Au (EZTR005186)
 - 1.00m @ 10.45 g/t Au (EZTR005253)
 - 4.00m @ 4.85 g/t Au (EZTR005259)
- **The widespread outcropping gold mineralisation at La Brea is associated with fault zones adjacent to the La Isla intrusion and shows significant geological similarities to the nearby Ternera Deposit.**
- **Detailed trenching program now set to be undertaken to refine initial drill locations ahead of maiden drilling of the large-scale La Brea target in the next few months.**

Tesoro Managing Director, Zeff Reeves, commented:

"These results from the La Brea area demonstrate the potential for a new large-scale gold system to have been uncovered by our team. We see gold mineralisation associated with favourable fault zones with associated widespread alteration, all adjacent to the La Isla intrusion, which we believe to be directly related to gold mineralisation."

La Brea is one of multiple high quality gold targets outside the Ternera Deposit that we continue to delineate at El Zorro. We look forward to commencing initial drill testing of the most prospective of these targets, including La Brea, in the coming months."

Figure 1: El Zorro Gold Project – District Gold Targets. La Brea is located approximately 15km north of the Ternerá Gold Deposit Datum PSAD56 19S.

LARGE-SCALE LA BREA GOLD TARGET

La Brea is located approximately 15km north of the 1.5Moz (unconstrained) Ternerá Deposit within the northern extent of the well defined El Zorro Gold corridor (Figure 1).

Previous mapping and sampling programs identified significant outcropping gold mineralisation associated with northwest trending fault zones, located adjacent to the La Isla granodiorite intrusion (ASX Announcement 15 April 2024). The La Isla intrusion is interpreted to be related to the El Zorro Tonalite intrusions, which host the majority of the gold mineralisation at the Ternerá Deposit (ASX Announcement 9 March 2023).

Recent follow-up work at La Brea included detailed geological mapping and systematic channel sampling across favourable geology. A total of 317 samples were collected.

Results returned widespread outcropping gold mineralisation along favourable northwest trending fault zones and adjacent alteration, both within, and surrounding, the La Isla intrusion. **Four major northwest mineralised trends have been identified, up to 200m wide and 4km long (Figure 2), highlighting the vast scale and potential of the La Brea target.**

Assayed gold grades of up to 22.10 g/t Au were returned and 128 samples (~40%) returned results above 0.10 g/t Au highlighting the widespread nature of gold mineralisation at La Brea.

Significant results are presented in Table 1 and all results presented in Appendix 1.

Figure 2: El Zorro Gold Project – La Brea Target showing mapped structural and alteration zones with gold in red. For previous results refer to ASX announcement 15 April 2024. Datum PSAD56 19S

NEXT STEPS

Follow-up work is underway at La Brea, which includes excavation of continuous trenches across the main identified mineralised zones and installation of access tracks. Additional mapping is also set to be utilised to determine initial drill hole locations. **Maiden drilling of the large-scale La Brea target is scheduled in the next few months.**

Table 1: Significant results table for results reported in this announcement. Results are uncut, no top cut has been applied. Refer Appendix 1 - JORC Tables for data aggregation criteria. A significant result is defined as any sample with a gold grade > 1.00 g/t Au.

Table 2 – Constrained March 2023 Terner MRE

Area	Au g/t cut off	Indicated			Inferred			Total		
		Mt	Au g/t	Koz	Mt	Au g/t	Koz	Mt	Au g/t	Koz
Open Pit Resource	0.30	22.5	1.10	795	10.0	1.18	379	32.5	1.13	1,175
Underground Resource	1.50	0.1	2.64	7	1.2	2.64	100	1.3	2.64	107
Total Resources		22.6	1.11	802	11.2	1.34	479	33.7	1.18	1,282

The updated MRE has been constrained to a US\$1,800/oz optimised pit shell, with the underground Resource reported at a 1.50g/t Au cut-off. The underground resource is reported at a cut-off where gold mineralisation is consistently well-developed below the optimised pit shell.

Au g/t cut off	Indicated			Inferred			Total		
	Mt	Au g/t	Koz	Mt	Au g/t	Koz	Mt	Au g/t	Koz
2.00	2.6	3.75	317	2.0	3.71	241	4.7	3.73	558
1.00	7.2	2.25	523	5.6	2.24	400	12.8	2.24	923
0.50	16.3	1.39	727	12.8	1.37	561	29.1	1.38	1,288
0.30	23.2	1.09	815	19.4	1.03	645	42.6	1.07	1,459

Unconstrained Terner MRE reported at various cut offs to the 200mRL.

For full details of the Terner Deposit Mineral Resource Estimate (802 koz Indicated, 479 koz Inferred), refer to ASX Announcement dated 9 March 2023.

About Tesoro

Tesoro Gold Limited has discovered and defined the first Intrusive Related Gold System in Chile. The 1.3M oz Ternerera discovery is in the Coastal Cordillera region of Chile. The Coastal Cordillera region is host to multiple world-class copper and gold mines, has well established infrastructure, service providers and an experienced mining workforce. Large areas of the Coastal Cordillera remain unexplored due to the unconsolidated nature of mining concession ownership, but Tesoro, via its in-country network and experience has been able secure rights to the district-scale El Zorro gold project in-line with the Company's strategy. Tesoro's 95% owned Chilean subsidiary owns 93.8% of the El Zorro Gold Project.

Future Performance

This announcement may contain certain forward-looking statements and opinions. Forward-looking statements, including projections, forecasts and estimates, are provided as a general guide only and should not be relied on as an indication or guarantee of future performance and involve known and unknown risks, uncertainties, assumptions, contingencies and other important factors, many of which are outside the control of the Company and which are subject to change without notice and could cause the actual results, performance or achievements of the Company to be materially different from the future results, performance or achievements expressed or implied by such statements. Past performance is not necessarily a guide to future performance and no representation or warranty is made as to the likelihood of achievement or reasonableness of any forward-looking statements or other forecast. Nothing contained in this announcement, nor any information made available to you is, or and shall be relied upon as, a promise, representation, warranty or guarantee as to the past, present or the future performance of Tesoro Gold.

Competent Persons Statements

The information in this report that relates to Mineral Resources is based on information compiled by Mr Lynn Widenbar, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy. Mr Widenbar is acting as an independent consultant to Tesoro Gold Limited. Mr Widenbar has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. The Company confirms that it is not aware of any new information or data that materially affects the information contained the form and context in which the Competent Person's findings are presented have not been materially modified from in the original announcement on 9 March 2023, and all material assumptions and technical parameters underpinning the estimates in that announcement continue to apply and have not materially changed. The Mineral Resource comprises 802koz in the Indicated and 479koz in the Inferred category.

The information in this report that relates to Exploration Results is based on information compiled by Mr Zeffron Reeves (B App Sc (Hons) Applied Geology) MBA, MAIG). Mr Reeves is a member of the Australian Institute of Geoscientists and a Director and shareholder of the Company. Mr Reeves has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Reeves consents to the inclusion in this report of the matters based on this information in the form and context in which it appears.

APPENDIX 2: JORC TABLES**Section 1: Sampling Techniques and Data**

Criteria	JORC Code explanation	Commentary
Sampling techniques	Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as downhole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.	Tesoro completed rock chip channel sampling. Sampling processes are considered appropriate for the style of mineralisation.
	Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.	Tesoro completed channel sampling. Sampling processes are considered appropriate for the style of mineralisation.
	Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done, this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.	Tesoro has completed a channel sampling program. Sampling was by industry standard technique including: - location of the station using handheld GPS. - A minimum 2 kg of continuously sampled rock was collected for each sample. - Samples are packed in plastic bags with assay-number tickets stapled to the bag.
Drilling techniques	Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).	No drilling reported in this report.
Drill sample recovery	Method of recording and assessing core and chip sample recoveries and results assessed.	No drilling reported in this report.
	Measures taken to maximise sample recovery and ensure representative nature of the samples.	No drilling reported in this report.
	Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	No drilling reported in this report.
Logging	Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.	Qualitative logging and descriptions of each sample were made, recorded by Tesoro's geologists
	Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.	Logging of samples was qualitative.
	The total length and percentage of the relevant intersections logged.	All samples logged and recorded.
Subsampling techniques and	If core, whether cut or sawn and whether quarter, half or all core taken.	No drilling reported in this report

Criteria	JORC Code explanation	Commentary
sample preparation	If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.	Tesoro has not completed any percussion drilling.
	For all sample types, the nature, quality and appropriateness of the sample preparation technique.	Samples were pulverised to 75% passing 200 mesh in prior to digestion for assay and analysis.
	Quality control procedures adopted for all subsampling stages to maximise representivity of samples.	Samples were logged by a qualified geoscientist. Each subsample is considered to be representative of the sample.
	Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.	There are field duplicate samples collected from the channels with irregular results.
	Whether sample sizes are appropriate to the grain size of the material being sampled.	Sample sizes collected were considered appropriate to reasonably represent the material being tested.
Quality of assay data and laboratory tests	The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.	Assays reported in this report were undertaken at the accredited laboratory of ALS Santiago, which is fully certified. Sediment samples were assayed using a 50 g fire assay and AAS finish for gold. Multielement assays were completed by 4-acid digest with a 2.5 g charge. All techniques are appropriate for the element being determined.
	For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.	NA
	Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.	QAQC procedures included the insertion of Certified Reference Materials (CRMs) (5%) and blank material (2%), Check samples (5%) and check assaying (5%) The laboratories used have generally demonstrated analytical accuracy at an acceptable level within 95% confidence limits.
Verification of sampling and assaying	The verification of significant intersections by either independent or alternative company personnel.	No significant intersections have been reported.
	The use of twinned holes.	No twinned holes have been completed.
	Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.	Tesoro sampling is digitally entered and stored following documented handling protocols. The protocols are considered adequate.
	Discuss any adjustment to assay data.	No adjustments were made to assay data
Location of data points	Accuracy and quality of surveys used to locate drillholes (collar and downhole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.	Channel Sample locations have been located using a handheld GPS.
	Specification of the grid system used.	The grid system used PSAD56 19S
	Quality and adequacy of topographic control.	The topography generated from an accurate topographic survey data completed by a registered surveyor and has been used for the current control.
Data spacing and distribution	Data spacing for reporting of Exploration Results.	The sample is collected on a nominal 2kg of material from predetermined locations. this spacing is deemed acceptable for the style of mineralisation.
	Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral	No estimation procedures have been applied.

Criteria	JORC Code explanation	Commentary
	Resource and Ore Reserve estimation procedure(s) and classifications applied.	
	Whether sample compositing has been applied.	Sample compositing was not employed at the sampling stage.
Orientation of data in relation to geological structure	Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.	Channel samples are generally, where possible, sampled perpendicular to interpreted geological structures.
	If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	No drilling reported in this report.
Sample security	The measures taken to ensure sample security.	Chain of Custody of digital data is managed by the Company. Physical material was stored on site and, when necessary, delivered to the assay laboratory. Thereafter laboratory samples were controlled by the nominated laboratory which to date has been Bureau Veritas and ALS Santiago. All sample collection was controlled by digital sample control file(s) and hardcopy ticket books.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	No audits have been undertaken.

Section 2: Reporting of Exploration Results

Criteria	JORC Code explanation	Commentary
Mineral tenement and land tenure status	Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.	Information regarding tenure is included in the company's March 2025 quarterly report released to the ASX on 30 April 2025. Tesoro Resources Ltd, 95% owned Chilean subsidiary, Tesoro Mining Chile SpA, owns approximately 94% of the El Zorro Gold Project Concessions.
	The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	The Concession is believed to be in good standing with the governing authority and there is no known impediment to operating in the area.
Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	Little historical exploration has been undertaken in either project area. Coeur d'Alene's Chilean exploration division undertook activities on the Ternera prospect, under an option agreement with the previous owners between April 1990 and January 1993.
Geology	Deposit type, geological setting and style of mineralisation.	The mineralisation model is considered to be an intrusive related gold deposit. The key characteristics that are consistent with this style deposit include: - Low sulphide content, (typically <5%); reduced ore mineral assemblage that typically comprises pyrite and lacks primary magnetite or hematite - Mineralisation occurs as sheeted vein deposits or stockwork assemblages and often combine gold with variably elevated Bi, W, As, Mo, Te, and/or Sb but low concentrations of base metals as seen in the initial four holes by Tesoro at El Zorro - Restricted and commonly weak proximal hydrothermal alteration - Intrusions of intermediate to felsic composition.
Drillhole information	A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drillholes:	All material information is presented in the report.

Criteria	JORC Code explanation	Commentary
	◦ easting and northing of the drillhole collar ◦ elevation or RL (Reduced Level – elevation above sea level in metres) of the drillhole collar ◦ dip and azimuth of the hole ◦ downhole length and interception depth ◦ hole length. • If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	
Data aggregation methods	• In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.	No cutting of grades has been undertaken at this early stage of exploration drilling. Significant results are calculated using a length weighted averaging method
	• Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.	length weighted average results are calculated using a 0.20g/t Au cut off and a maximum of 3m internal dilution.
	• The assumptions used for any reporting of metal equivalent values should be clearly stated.	No metal equivalents are reported.
Relationship between mineralisation widths and intercept lengths	• These relationships are particularly important in the reporting of Exploration Results.	
	• If the geometry of the mineralisation with respect to the drillhole angle is known, its nature should be reported.	The mineralisation forms sub-vertical sheeted veins and individual veins and may form plunging zones within the mineralised structures.
	• If it is not known and only the downhole lengths are reported, there should be a clear statement to this effect (e.g. 'downhole length, true width not known').	
Diagrams	• Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drillhole collar locations and appropriate sectional views.	Relevant maps and diagrams are included in the body of the report.
Balanced reporting	• Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	All material assay results from drilling are reported.
Other substantive exploration data	• Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential	All material exploration data is reported in the body of the report.

Criteria	JORC Code explanation	Commentary
	<i>deleterious or contaminating substances.</i>	
Further work	<i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i>	Further work will be focused on determining targets for drill testing mineralisation as defined in the work program.
	<i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i>	Diagrams have been included in the body of this report.
