# Pure Minerals Limited 

## ASX Announcement

## INFILL SOIL SAMPLING DEFINES HIGH-PRIORITY LITHIUM-TANTALUM TARGETS AT MORRISSEY HILL PROJECT

- Objective achieved in improving the resolution of the 5 km -long $\mathbf{x} \mathbf{1 k m}$ wide anomaly announced in October 2017
- One high-priority lithium-tantalum anomaly and at least one other priority tantalum anomaly identified
- Previous rock chip samples within these anomalies have returned up to 1.31\% $\mathrm{Li}_{2} \mathrm{O}$ and 238.7 ppm $\mathrm{Ta}_{2} \mathrm{O}_{5}$
- Similarities to initial results from nearby lithium discoveries

Pure Minerals Limited (ASX: PM1) ("Pure Minerals", "the Company") is pleased to announce results from infill soil sampling at its $80 \%$-owned Morrissey Hill project located in Western Australia's Gascoyne region.

Further soil sampling was completed at Morrissey Hill as follow-up to a soil sampling programme that was announced on the $5^{\text {th }}$ October 2017. That initial programme defined a significant elevated lithium-tantalum anomaly more than 5 km long and up to 1 km wide, a further two additional tantalum anomalies each more than 1 km long were also delineated. The objective of the current programme was to improve the resolution of the larger anomaly to provide greater resolution to target planned drilling.

Well-defined lithium-tantalum soil anomalies discovered

The soil survey consisted of 1,114 samples over a $200 \mathrm{~m} \times 50 \mathrm{~m}$ grid that infilled and extended the previous program of 133 samples collected on an $800 \mathrm{~m} \times 200 \mathrm{~m}$ grid. A minus 80 mesh fraction was also trialled to improve the resolution of the anomalous area. All samples were then subjected to analysis using a portable XRF analyser, from this a further 507 samples were prioritised for further analysis, including analysis for Lithium in Perth.

The $59 \mathrm{~km}^{2}$ Morrissey Hill project is known to host multiple pegmatite intrusions and fractionated granites which have the potential to host lithium mineralisation. The soil sampling program was designed to identify lithological packages with anomalous pathfinder elements
for lithium-caesium-tantalum pegmatites ( $\mathrm{Li}, \mathrm{Cs}, \mathrm{Ta}, \mathrm{Nb}, \mathrm{Rb}$ ) which may indicate sub-cropping prospective pegmatites.

The program successfully delineated and defined two high priority lithium and tantalum anomaly areas (see Figure 1, Appendix A), including:
(1) a $2.1 \mathrm{~km} \times 1.1 \mathrm{~km}$ lithium and tantalum soil anomaly, with results up to $474 \mathrm{ppm} \mathrm{Li}_{2} \mathrm{O}$ and $28 \mathrm{ppm} \mathrm{Ta} 2 \mathrm{O}_{5}$, and
(2) a smaller tantalum-rich soil anomaly of $0.7 \mathrm{~km} \times 0.2 \mathrm{~km}$ with results up to $19 \mathrm{ppm} \mathrm{Ta} 2 \mathrm{O}_{5}$

Both anomalies may reflect one contiguous zone of mineralisation overlain by a SW-NEtrending drainage channel that has split the anomalies into two.

Figure 1: Soil anomalies of lithium (left) and tantalum (right), along with corresponding rock chip sampling results. A lithium-tantalum soil anomaly near the centre of the tenement is clearly evident, plus a smaller more tantalum-rich anomaly located 2 km to the south of the main anomaly.

The z-score analysis indicates a far broader anomaly which is interpreted to be extending more than 5 km long and 1.5 km wide that has been truncated by SW-NE trending drainage.

Figure 2: Soil anomalies, soil sampling locations showing multivariate Z-score (Li, $\mathrm{Ta}, \mathrm{Cs}, \mathrm{Rb}, \mathrm{Nb}$ ), and highlighted rock chip samples.

The soil anomalies are consistent with lithium and tantalum rock chip samples collected on site. Previous rock chip samples in the northern $\mathrm{Li}-\mathrm{Ta}$ anomaly registered grades up to $1.31 \% \mathrm{Li}_{2} \mathrm{O}$ and 238.7ppm Ta $\mathrm{O}_{5}$ (refer ASX Announcement/Prospectus dated 5 May 2017 and the ASX Announcement dated 5 October 2017).

## Proximity to Malinda lithium discovery

Morrissey Hill is located approximately 10km west of Arrow Minerals' (formerly Segue Resources) recent Malinda (formerly Reid Well) lithium discovery. Arrow Minerals completed a maiden reverse circulation (RC) drilling programme of four outcropping pegmatites in September 2017, intersecting up to $2.0 \% \mathrm{Li}_{2} \mathrm{O}$ (lithium) and over $800 \mathrm{ppm} \mathrm{Ta}{ }_{2} \mathrm{O}_{5}$ (tantalum). In addition, XRD analysis of high-grade lithium samples from the Blade Prospect confirmed the primary lithium-bearing mineral as spodumene.

The Malinda discovery was based off a soil sampling and rock chip sampling program, announced 12 April 2017, that delineated a $1.3 \mathrm{~km} \times 1.0 \mathrm{~km}$ lithium and tantalum anomaly of similar magnitude to the Morrissey Hill anomaly.

Arrow intends to re-commence drilling in July 2018 (Arrow Minerals ASX Announcement dated 22 March 2018).

## Next Steps at Morrissey Hill

Having successfully defined high-priority lithium-tantalum soil anomalies, Pure Minerals believes that a targeted program of drilling testwork is warranted and has begun planning to that effect.
-Ends-

For and on behalf of the Board Mauro Piccini, Company Secretary

## COMPETENT PERSON STATEMENT:

The information in this report that relates to Exploration Results at the Morrissey Hill Project complies with the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code) and has been compiled and assessed under the supervision of Mr Kell Nielsen BSc (Geol.), MSc (Mineral Econ.), a consultant to Pure Minerals Limited and director of Mannika Resources Group Pty Ltd. Mr Nielsen is a Member of the Australasian Institute of Mining and Metallurgy. He has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the JORC Code. Mr Nielsen consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears. The Exploration Results are based on standard industry practises for drilling, logging, sampling, assay methods including quality assurance and quality control measures as detailed in Appendix 3.

## Appendix B. The following tables are provided to ensure compliance with the JORC Code (2012) requirements for the reporting of Exploration Results for the Morrissey Hill Project.

## Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Sampling techniques | - Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. <br> - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. <br> - Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. | - Soil sampling was originally carried out at on a 800 mx 200 m spacing. Holes were dug below the surface and samples taken by sieving through a 2 mm sieve and retaining the fine (<2mm) fraction. Samples are believed to be as representative as is required at this early stage of exploration based on sample size collected and method utilised. <br> - Infill and follow up soil sampling was carried out at on a $200 \mathrm{~m} \times 50 \mathrm{~m}$ spacing. Holes were dug below the surface and samples taken by sieving through an 80 mesh sieve and retaining the fine (<80 mesh) fraction. Samples are believed to be as representative as is required at this early stage of exploration based on sample size collected and method utilised. <br> - Infill samples were analysed using a portable XRF analyser with areas of interest sent for further analysis, including lithium, that is not detected by the portable XRF analyser <br> - Standard lab preparation and sub sampling techniques used. |
| Drilling techniques | - Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, facesampling bit or other type, whether core is oriented and if so, by what method, etc). | - No drilling was carried out at the Morrissey Hill Project. |
| Drill sample recovery | - Method of recording and assessing core and chip sample recoveries and results assessed. <br> - Measures taken to maximise sample recovery and ensure representative nature of the samples. <br> - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. | - No drilling was carried out at the Morrissey Hill Project. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Logging | - Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. <br> - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. <br> - The total length and percentage of the relevant intersections logged. | - No drilling was carried out at the Morrissey Hill Project. |
| Subsampling techniques and sample preparation | - If core, whether cut or sawn and whether quarter, half or all core taken. <br> - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. <br> - For all sample types, the nature, quality and appropriateness of the sample preparation technique. <br> - Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. <br> - Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. <br> - Whether sample sizes are appropriate to the grain size of the material being sampled. | - Standard lab preparation and sub sampling techniques used. <br> - Appropriate protocols used for reconnaissance sampling. |
| Quality of assay data and <br> laboratory tests | - The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. <br> - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. <br> - Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. | - Quoted rockchip results and soil geochemistry (MSS0001MSS0133) are referred to in previously released announcements, more specifically the announcement dated October 2017 in reference to Morrissey Hill <br> - For soils the samples were prepared and analysed by MS91-PKG at ALS Perth. <br> - These assay methods are considered appropriate for the metals being investigated. |
| Verification of sampling and assaying | - The verification of significant intersections by either independent or alternative company personnel. <br> - The use of twinned holes. <br> - Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. | - No verification has been completed as only primary data used. <br> - Data is compiled directly from laboratory certificates into datasheets compiled by the consultant geologists. Checks against field notes and spatially utilising GIS software are completed. <br> - $\quad \mathrm{Li}(\%)$ was converted to Li 2 O (\%) by multiplying by 2.153 and then by multiplying by 10,000 to convert to $\mathrm{Li}_{2} \mathrm{O}$ (ppm) |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | - Discuss any adjustment to assay data. | - Ta (ppm) was converted to $\mathrm{Ta}_{2} \mathrm{O}_{5}$ (ppm) by multiplying by 1.221 <br> - Equation for Z-Score, used in geochemistry: <br> $Z=(X-\mu) / \sigma$ <br> $Z=Z$ value, <br> $\mathrm{X}=$ Sample value, <br> $\mu=$ Mean of the dataset, <br> $\sigma=$ standard deviation of the dataset <br> - Equation of additive multivariate Z-Score: <br> LCT_Z $=\mathbf{Z}(\mathrm{Li})+\mathbf{Z}(\mathrm{Cs})+\mathrm{Z}(\mathrm{Ta})+\mathrm{Z}(\mathrm{Rb})+\mathrm{Z}(\mathrm{Nb})$ |
| Location of data points | - Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. <br> - Specification of the grid system used. <br> - Quality and adequacy of topographic control. | - All samples are located with a handheld GPS and an accuracy of $+/-5 \mathrm{~m}$. <br> - Grid used for the samples is MGA94 Zone 50. <br> - Topographic control is provided by publicly available data. |
| Data spacing and <br> distribution | - Data spacing for reporting of Exploration Results. <br> - Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. <br> - Whether sample compositing has been applied. | - Data spacing used for soils samples ios closer spaced in order to delineate first pass drilling . |
| Orientation of data in relation to geological structure | - Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. <br> - If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. | - Soil sampling grid was oriented to the NE as pegmatites were observed in $\mathrm{E}-\mathrm{W}$ and $\mathrm{N}-\mathrm{S}$ orientations. This orientation was felt best to obtain an unbiased result. <br> - Once the orientation of these pegmatites is ascertained in more detail then the orientation of future surveys as well as drilling may be refined. |
| Sample security | - The measures taken to ensure sample security. | - All samples were submitted directly to the lab |
| Audits or reviews | - The results of any audits or reviews of sampling techniques and data. | - None completed to date. |

## Section 2 Reporting of Exploration Results

| Criteria | JORC Code explanation | Commentary |
| :--- | :--- | :--- |
| Mineral <br> tenement <br> and land <br> tenure status | -Type, reference name/number, <br> location and ownership including <br> agreements or material issues with <br> third parties such as joint ventures,• E09/2132, E09/2133 and E09/2136-1 are held by Mineral <br> Developments Pty Ltd (MinDev). Pure has executed an <br> agreement to acquire 80\% of MinDev. |  |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. <br> - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. | - All tenements are granted and Heritage Agreements are in place with the Thudgari, Wajarri and Gnulli Claimant Groups. |
| Exploration done by other parties | - Acknowledgment and appraisal of exploration by other parties. | - Previous exploration was completed by the GSWA, Agip, Nord Resources, Kookynie Resources, Kalgoorlie South Gold Mines, Rare Resources, Helix Resources, and Encounter Resources. |
| Geology | - Deposit type, geological setting and style of mineralisation. | - All tenements are located within the Gascoyne province of WA, which is the deformed and high-grade metamorphic core of the early Proterozoic Capricorn Orogen which lies between the Pilbara Craton and the Yilgarn Block. Tectonic trends within the Gascoyne Province wrap around the margins of these relatively stable cratons. The Gascoyne Province comprises voluminous granitoid intrusions, mantled-gneiss domes, metamorphosed and partly melted sedimentary rocks and remobilised Archaean basement gneiss. While the Gascoyne Province is not as well endowed with operating mines when compared to the Yilgarn and Pilbara Cratons there is evidence for mineralised systems being active within the Capricorn Orogen and a number of recent exploration successes point to the potential of the Province. <br> - Target mineralisation at the Morrissey Hill Project is pegmatite hosted U-Li-REE mineralisation (LCT model) and secondary calcrete $U$ mineralisation. |
| Drill hole Information | - A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: <br> - easting and northing of the drill hole collar <br> - elevation or RL (Reduced Level - elevation above sea level in metres) of the drill hole collar <br> - dip and azimuth of the hole <br> - down hole length and interception depth <br> - hole length. <br> - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. | - No drilling was carried out at the Morrissey Hill Project. |
| Data aggregation methods | - In reporting Exploration Results, weighting averaging techniques, | - Contoured geochemistry images were generated using a inverse distance with a factor of 2 contouring technique |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
|  | maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. <br> - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. <br> - The assumptions used for any reporting of metal equivalent values should be clearly stated. | with no orientation being specified. |
| Relationship between mineralisatio $n$ widths and intercept lengths | - These relationships are particularly important in the reporting of Exploration Results. <br> - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. <br> - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known'). | - No drilling was carried out at the Morrissey Hill Project. |
| Diagrams | - Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views. | - Maps and appropriate plans are included in this announcement. |
| Balanced reporting | - Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. | - All results are tabulated in Appendices A and shown on figures in this announcement. |
| Other substantive exploration data | - Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | - Substantial open file data including historical exploration reports by companies listed above, geophysical and ASTER data has been summarised in previous releases. |
| Further work | - The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). <br> - Diagrams clearly highlighting the areas of possible extensions, including the main geological | - As detailed in the report. |

| Criteria | JORC Code explanation | Commentary |
